Let us now turn to some methodological issues which are presented by the necessity of transforming variables if a multiplicative model is to be used in regression analysis. We may begin with a banal but necessary observation: geometric intuition is often used in discussions of correlation and regression problems but we wish to focus attention on algebra, not geometry. It is, after all, the algebraic form of a function which determines its properties.

Our first question can be rephrased in its simplest form as follows: given Y as a function of X_1 and X_2 , does a model which "builds in" interaction between X_1 and X_2 predict better than one which does not build in interaction? An ancillary question is the following: Does the relative influence of the two predictors depend on the model chosen? Notice that these are very different kinds of questions, for it is certainly possible that both an interactive and a non-interactive model will have about the same predictive power but will lead to very different interpretations of

the importance of the variables used as predictors. These two questions present issues of theory construction (choice of models) and also systematic description (what to observe). This is not just an exercise in curve fitting or selecting the transformations which best predict a criterion. The problem of choice of models at issue here has substantive and theoretical import, as we hope to show empirically.

Several of the methodologically relevant and important suggestions made by Soares and Hamblin can be recapitulated most conveniently by considering a three variable example with our Pennsylvania data. Let the Y variate, the criterion variable to be predicted, be percentage Democratic vote in 1960 in Pennsylvania counties. As predictors X_1 and X_2 we choose a measure of income and a measure of cultural variation in the rural-urban character of the counties.¹⁰ All measures are expressed in percentage form.

We wish to ascertain which of the following forms is the best predictor of variation in Y :

$$(I) Y = b + m_1X_1 + m_2X_2$$

or

$$(II) Y = bX_1^{m_1}X_2^{m_2}$$

It is a happy accident of algebra that model II can be converted to a form which allows the application of least squares regression techniques for estimating the necessary constants.¹¹ The results of correlation analysis for these two models using our Pennsylvania data are given in Table 2. For these particular data model II provides a more adequate representation. If the square of the multiple correlation coefficient is used as a criterion, the interactive model accounts for more than 10 percent more variance. Substantively (and theoretically) the analysis suggests that wealth and social milieu (or culture) interact in influencing the voting behavior of individuals. Put another way, if we assume that the influence of income on the vote depends on the degree of urbanization (and conversely) we can predict more variation in the vote than if we assume they are independent. On the other hand, both models lead to the same interpretation as to the relative importance of income and culture if partial correlations are used

¹⁰ We selected here the 1960 county percentages of income receivers earning less than \$3,000 per year and of rural-farm population of the county total. Bureau of the Census, *County and City Data Book*, 1962 ed.

¹¹ A succinct account of the two-variable case is found in F. E. Croxton and D. J. Cowden, *Applied General Statistics*, 2nd ed. (Englewood Cliffs: Prentice-Hall, 1955), pp. 508-512.

TABLE 2. CORRELATION ANALYSIS OF ADDITIVE AND MULTIPLICATIVE REPRESENTATIONS FOR $Y = F(X_1, X_2)$. (PENNSYLVANIA DATA)*

	Model I	Model II**
	$Y = b + m_1X_1 + m_2X_2$	$Y = bX_1^{m_1}X_2^{m_2}$
Multiple R^2	0.36	0.47
Partial $r^2_{X_1}$	0.06	0.08
Partial $r^2_{X_2}$	0.34	0.45
degrees of freedom	64	64

* Y is Democratic presidential vote in 1960 in percent, X_1 is income measured by percent receiving less than \$3,000 annually, and X_2 is rurality measured by percent rural farm.

** Actual regression was

$$\text{Log } (Y) = \text{Log } (b) + m_1 \text{Log } (X_1) + m_2 \text{Log } (X_2)$$

as a criterion. For reasons developed below we will reject the interpretation of interdependence as being generally true for these variables even for these Pennsylvania data, but the example serves to demonstrate the real possibility and the potential significance of difference in form in the analyses of aggregate voting data.

Although the algebra by which a linear form for use in regression is obtained is straightforward, it is doubtless the case that some empiricists feel as we did: is this black magic? Indeed, one can find remarks in the statistical application literature which suggest that when dealing with logarithmic (or any other non-linear) transformation, caution is in order.¹²

It seemed that two tests would make us believers in the Hamblin-Soares results: first, that increases in explained variance did not automatically occur, no matter what the data, when a multiplicative was substituted for an additive model (this is our original second ques-

¹² The issue is whether or not variances are changed proportionately in all variables. Certainly no data will exhibit precise proportionality. What we do in the text below is exhibit a test procedure which assesses the consequences of the error that is (inevitably) introduced by transformation. The test is basically empirical. Paul G. Hoel asserts that these consequences are typically of small magnitude. See Hoel, *Introduction to Mathematical Statistics*, 3rd ed. (New York: Wiley, 1962), p. 178. On the other hand, transforming variables to meet distribution assumptions is a common practice engaged in for its statistical benefits. See for example, J. Johnston, *Econometric Methods* (New York: McGraw-Hill, 1963), especially pp. 44-45.

tion); and second, using the results of the regression based on logarithmically transformed variables, it should be possible to predict the original untransformed dependent variable with the degree of accuracy indicated by the correlation associated with the regression based on transformation.

The first issue was quickly settled. Very few of the analyses attempted on aggregate data from Pennsylvania counties showed increases in prediction when a multiplicative model was used. Indeed, as Table 3 shows, for a set of three predictors and a distinct set of four predictors in both 1960 and 1964 an additive rather than a multiplicative model would account for more total variance.¹³

We turn now to the question of whether or not the analysis based on logarithmically transformed variables and the correlation coefficient associated with it seriously misrepresents the predictive power of multiplicatively written (untransformed) original measurements for these data. In the logarithmic equation the estimates of coefficients are the powers to which the various predictors are to be raised in the multiplicative equation. The constant in the logarithmic regression is the logarithm of the multiplicative constant for the multiplicative equation. As an empirical test we executed still another regression analysis.

The estimates of constants from the logarithmic regression, being estimated by least squares are presumably unique. Hence, if a new variable is constructed using these constants to weight its components, and this is used in a simple regression on the original untransformed variables, we should expect: (1) approximately the same but slightly higher correlations, (2) a new regression constant close to zero in value, and (3) a new slope close to one in value.

The procedure is as follows: starting with the results of the logarithmic regression analysis create a new variable, X^* , an index variable, given in the three variable case by

$$X^* = bX_1^{m_1}X_2^{m_2},$$

where b , m_1 , and m_2 are obtained from the logarithmic regression. Next, do a simple two variable regression using X^* as the predictor and obtain a new slope and intercept, b^* and m^* , i.e., regress to obtain

$$Y = b^* + m^*X^*.$$

The correlation associated with this regression is a measure of the ability to predict the un-

¹³ Professor Hamblin has assured us that he does not always, or even usually, obtain dramatic results by resort to a multiplicative mode. Personal communication from R. Hamblin.

TABLE 3. COMPARISON OF THE SQUARE OF THE MULTIPLE CORRELATION COEFFICIENT FOR ADDITIVE AND MULTIPLICATIVE MODELS (PENNSYLVANIA DATA)*

Multiple Predictors**	R ²			
	1960		1964	
	Additive	Multi- plicative	Additive	Multi- plicative
Non-white, Foreign Parents, Income Less than \$3,000, and Rural Farm	.66	.56	.49	.43
Urban, White Collar, and High School or More Education	.27	.22	.20	.19

* The criterion measure was the percentage voting Democratic in both years.

** All variables are measured in percentages.

transformed original variable Y with a multiplicative model. If the correlations are not approximately the same, we have empirical, rather than methodological, grounds for suspicion.

Now consider the constants b^* and m^* . If the original estimates of constants were the unique least squares constants, then X^* must be related to $bX_1^{m_1} X_2^{m_2}$ by an identity transformation, *i.e.*, m^* should be one and b^* should be zero. Otherwise the logarithmically estimated constants are not unique. This means that in our new regression b^* and m^* should be close to zero and one respectively, empirically.

Table 4 presents a comparison in terms of squared correlations. The comparisons of Table 4 show that the multiplicative model does as well as the logarithmic model on which it is based. The multiplicative correlation is somewhat larger and this bias becomes more pro-

nounced as the correlation increases. The bias is not large, however, and no row shows a reduction in correlation.

Table 5 gives the slopes and regression intercepts with standard errors for the same relationships as those of Table 4. Although there is no sampling problem here, the use of standard errors gives a measure of the magnitude of deviation from our hypotheses. The maximum error from our expectations is for the slope of the foreign parents regression, which is one and one eighth standard errors different from 1. Tables 4 and 5 are typical of what happens in all cases we have examined: correlations are slightly larger for the new regression, the slopes are close to one, and the regression constants close to zero. We conclude that empirical tests confirm the algebra—there is no black magic in the procedures advanced by Hamblin and Soares and the error introduced by transformation is small.

From the point of view of illustrating the possibilities of the paradigm set out in Table 1,

TABLE 4. COMPARISON OF SQUARED MULTIPLE CORRELATIONS BASED ON LOGARITHMIC REGRESSION WITH THOSE BASED ON THE RELATED INDEX CORRELATION (PENNSYLVANIA DATA)*

Single and Joint Predictors**	Logarithmic	Multi- plicative

** The criterion in each instance was percent voting Democratic in 1960.

there remains the case of a random "state of political nature." Tables 3 and 4 clearly show that it is at least empirically *possible*, interpretations aside, to obtain instances of both additive and multiplicative model superiority when judged by a correlation criterion. But how can a random "state of political nature" be created?

For this problem we offer the following solution.¹⁴ Shuffle a random sample of United States voters and assign them to arbitrary groups of the same size. Compute percentage measures of group characteristics and proceed in analysis as if the groups were ordinary aggregate data, *i.e.*, as if they were the same as Pennsylvania counties. This procedure creates random counties by creating arbitrary environments—a lumping together of individuals who lack neighborhood and other relationships with other members of the group. The objective of the procedure was to approximate the hypothetical random state of political nature of Table 1 with systematic data, *i.e.*, "real" observations.

If the paradigm of Table 1 is correct, then correlations associated with additive and multiplicative models should be about the same. Unfortunately our results were not that clear. Although sometimes the multiplicative model appeared superior, the preponderance of our analyses reveal a slightly better prediction for the additive model. Why is this the case? The fault lies with our conceptualization of the difference in correlations associated with the two different models. It tests only whether the predictors interact. But if predictor variables are randomly related they are independent, and this is another way of saying they do not interact. The additive model provides a theoretical representation of independent influences, but with the tools of analysis used here, this cannot be distinguished from a random state of political nature. Both random and independent political influences have the same formal representation and hence, from a technical point of view, row 3 of Table 1 is redundant for it asserts the same relationships as row 1. We found very weak relationships for the random groups. It may be that the appropriate prediction for row 3 is no relationship for either model.

IV. FINDINGS

Turning to the substantive aspects of this study, we may appropriately begin with an examination of the simple correlation arrays matching the percentage Democratic for 1960–1968

¹⁴ We report our results only in qualitative terms. The data were from the 1964 S. R. C. election study (courtesy of the Inter-University Consortium for Political Research).

TABLE 6. CONTINUITY AND CHANGE IN PREDICTOR VARIABLES: THE CASE OF PENNSYLVANIA, 1960–1968*

Predictor Variable	Correlation (r) with Democratic Percentage of the Vote:		
	1960	1964	1968
Foreign Parents	+ .72	+ .58	+ .68
Dem. Registration 1960	+ .67	+ .65	+ .61
Non-White	+ .41	+ .23	+ .32
High-school Graduate	— .13	— .12	— .09
Rural-farm	— .56	— .59	— .63

* All variables measured in percentages.

with five leading predictor variables.¹⁵ Simple correlations are presented in Table 6.

The first point of interest about this array is that it corresponds both to intuitive understanding about the mass base of party support in an industrial state and to the findings of survey analysis on the individual level: the Democratic percentage of the vote is strongly and positively correlated with ethnicity on one end of the continuum and strongly but negatively correlated with rurality on the other. Secondly, these arrays display an impressive continuity over three elections which had an extraordinary variety of short-term appeals and stimuli. There are not only no sign changes during the eight-year period, with a marginal exception in 1964; the variables also show very high continuity both in their absolute values and their ranking relative to each other.

But while this conveys an accurate picture of the profound stability of aggregate partisan allegiance, a third aspect—that of marked decline in the values of *r* in 1964, followed by a return nearly to 1960 levels in 1968—is also visible. It seems virtually certain that this change is intimately associated with the intense but probably mostly ephemeral short-term effect of the Goldwater campaign on voting behavior. As has been recently pointed out, the 1964 election was more heavily influenced by sectional response differentials than any other in at least a generation. In the case of Pennsylvania, as in those of other

¹⁵ As throughout this study, the Democratic percentage is of the three-party vote in 1968, and of the two-party vote in 1960 and 1964. As to the predictor variables, all are taken from the 1960 census, except for percentage Democratic of two-party registration. This is also, however, derived from a 1960 base.

states in the Northeast, the Democratic landslide of 1964 was produced not by an across-the-board pro-Democratic surge, but by a surge which was heavily concentrated among normally Republican voting groups.¹⁶ Such asymmetrical concentrations of shift within a given state seem to be central characteristics of temporary or permanent sectional realignment. It is obvious that to the extent that they occur, within-state differences—whether based upon cleavages associated with class, ethnicity or other factors—will be partially suppressed. The decline in overall prediction from our variables in 1964—particularly the decline in the r 's associated with ethnicity and race—quite nicely captures this sectional skewing by revealing the expected decline in the explanatory power of within-state differentiations. Similarly, the resurgence in 1968, which may well be more complete than it looks because of the obsolescence of 1960 census data, must strongly imply not only that the 1964 surge was a short-lived “deviating” election situation but that in Pennsylvania the now-traditional contours of the New Deal alignment were substantially restored in 1968.

A conversion of the major-party (Democratic) simple correlations to the function form $Y = bX^m$ generates an array, Table 7, which can be compared with that in Table 6.

TABLE 7. POWER FUNCTION MODEL* AND THE PENNSYLVANIA VOTE, 1960-1968**

Predictor Variables	Correlation (r) of Democratic Percentage of the Vote:		
	1960	1964	1968
Foreign Parents	+.62	+.51	+.65
Dem. Registration 1960	+.65	+.64	+.58
Non-white	+.35	+.21	+.29
High-school Graduate	-.12	-.11	-.07
Rural-farm	-.65	-.59	-.67

* Actual analysis was with $\text{Log } (y) = m \text{ Log } (x) + \text{Log } (b)$.

** All variables measured in percentages.

The most obvious conclusion to be derived from a comparison of the two tables is that, so far as major-party voting in Pennsylvania is concerned, there is generally very little difference in the explanatory power of the additive and power function models. Indeed, for all variables except

percentage rural-farm, the simple linear model is somewhat to be preferred. Thus, there is no reason in such a case to prefer the more complicated interpretations associated with the power function model.

When one turns to the interrelationships between the variables in an additive multiple correlation set, Table 8, a pattern emerges which is remarkably different in its implications from that which is suggested by an array of simple correlations for each variable with the percentage Democratic of the vote.

TABLE 8. CHANGE AND CONTINUITY IN EXPLANATION/PREDICTION: SQUARES OF MULTIPLE AND PARTIAL CORRELATION COEFFICIENTS 1960-1968*

Predictor Variables	Partial R^2		
	1960	1964	1968
Foreign Parents	.55	.10	.32
Dem. Registration 1960	.45	.37	.31
Non-white	.26	.00	.03
High-school Graduate	.18	.01	.06
Rural-farm	.14	.27	.28
Multiple R^2	.88	.72	.80

* Degrees of Freedom = 61. All variables are measured in percentages.

What stands out here with remarkable clarity, using the partial correlation as a criterion, is the steep decline in the importance of the ethnic and racial variables, the increased importance of the rural variable, and the enduring if gradual declining significance of the registration or aggregate-party identification variable. The result is a massive short term difference in the relative weighting of the “independent” variables. Thus in 1960 ethnicity and party are the two most important factors, but these become party and rurality in 1964. The 1968 restoration, while it is a restoration, displays pointed differences from 1960. Again, the massive difference between the 1964 alignment in Pennsylvania and those which preceded and succeeded it stands out in bold relief. The loss of significance for the foreign-parents and non-white variables in 1964 is not to be understood, of course, as indicating a lessening of the absolute magnitude of support for the Democrats from such groups; to the contrary, especially among nonwhites. What is explicitly revealed is the effect of a within-state compression in which largely white, native-stock counties move more heavily toward the Democratic

¹⁶ Burnham, “American Voting Behavior and the 1964 Election,” *op. cit.*

candidate than do those which have large concentrations of foreign-stock whites and/or non-whites. This within-state compression, to reiterate, seems a direct consequence of the sectional impact of the Goldwater candidacy on this northeastern state. Thus, what is left to explain in within-state terms is a set of cleavages which revolve around party registration and a rural-nonrural dimension.

Lest we lose sight of the curious mixture of change and continuity associated with these three elections, we pause for a moment in this discussion to present an array of much simpler data-reduction and autocorrelation measures associated with both the Democratic and Wallace votes during this period.

The data in Table 9 capture rather nicely the purely political side of Pennsylvania voting behavior at the county level during this period. The very great compression of county percentages Democratic between 1960 and 1964 comes

into clear view—the variance is cut nearly in half—as is its 1968 return to a level substantially equal to that of 1960. Such a massive deviation was largely the result, first, of an anti-Goldwater movement which tended to be maximized precisely in areas of 1960 Republican strength, and, second, of a counter-movement between 1964 and 1968 which returned the aggregate profile of the state's Democratic vote back approximately to that of 1960. But the sectional distortion of 1964 only partially subsided, for the time being, the basic electoral divisions within the state: this is clearly evidenced not only by the rather high 1960–1964 autocorrelation, but also by the extremely strong 1964–1968 r, whether measured in two-party or three-party terms for the latter year. The 1968 Wallace vote on the county level stands out for its very low correlation with any major-party percentages during the whole 1960–1968 period; but this is a matter of discussion at a later point in

TABLE 9. CHANGE AND CONTINUITY, 1960–1968: THE CASE OF PENNSYLVANIA

Year and Party	A. Measures of Central Tendency and Dispersion				
	Variance	Standard Deviation	Mean (N = 67)	State Percentages	Difference
1960 Democratic	104.49	10.22	40.9	51.2	–10.3
1964 Democratic	59.51	7.71	60.3	65.2	–4.9
1968 Democratic					
(Of 3-party vote)	96.57	9.83	39.7	47.8	–8.1
1968 Democratic					
(Of 2-party vote)	111.31	10.55	42.8	51.9	–9.1
1968 Wallace	4.58	2.14	7.3	8.0	–0.7
	B. Autocorrelations of Party Vote by County				
	1960 D	1964 D	1968 D (3-party)	1968 D (2-party)	1968 Wallace
1960 D	1.000	+.869	+.932	+.941	+.006
1964 D		1.000	+.957	+.951	–.133
1968 D (3-party)			1.000	+.995	–.152
1968 D (2-party)				1.000	–.054
1968 Wallace					1.000
	C. Squared Correlation Coefficients (r^2)				
	1960 D	1964 D	1968 D (3-party)	1968 D (2-party)	1968 Wallace
1960 D	1.000	.756	.868	.885	.000
1964 D		1.000	.915	.905	.018
1968 D (3-party)			1.000	.990	.023
1968 D (2-party)				1.000	.003
1968 Wallace					1.000

this paper. So far as the basic political data for major-party voting in this period is concerned, the abnormality of the 1964 array stands out, but remains somewhat marginal. The political data alone suggest that continuity of aggregate voting structures through the 1964 upheaval is at least as important as that upheaval itself—at any rate, in Pennsylvania.¹⁷

Taken over the entire eight-year period, indeed, there is reason to assume that, while the short-term deviating effects of 1964 are again dramatically visible, the 1968 coalition is very similar to, but is not quite the same as, its 1960 predecessor. In particular, the ethnic and racial variables were markedly less important in 1968 than eight years previously, while the rural-farm variable was considerably more so. Granted the low correlations between the Wallace vote in 1968 and any of our variables presented below, it seems quite unlikely that this decline in importance for two variables and increase in importance for another between 1960 and 1968 can be directly causally related to this third-party intrusion.¹⁸

¹⁷ There is, of course, a longer historical dimension to the story which cannot receive very explicit treatment here. The 1964 variance of 59.51, for example, is the lowest in the electoral history of the state since 1940, although the Eisenhower landslide of 1956 produces an almost comparably low figure of 72.69. All others in the period show variances roughly the same as those of 1960 or 1968. Similarly, if one extends autocorrelations of contiguous pairs of elections back to, say, 1916/1920, evidences of massive realignment emerge between 1920 and 1940 which have no counterpart in the data *within Pennsylvania* for the 1960's. Thus, the squared coefficients (based on the Democratic percentage of the two-party vote except for 1924) are as follows during this period: 1916/1920: .76; 1920/1924: .77; 1924/1928: .00; 1928/1932: .46; 1932/1936: .61; 1936/1940: .91. Thereafter, except for 1956/1960 and 1960/1964, all pairs yield a squared coefficient of .91 or above. For a discussion of the changing socio-economic and demographic correlations of the Pennsylvania vote during this period, see Walter Dean Burnham, *Critical Elections and the Future of American Politics* (New York: Norton, 1970). The appendix reports two tables relevant to these considerations.

¹⁸ It may, unfortunately, be partly an artifact of census data which, while fitting the 1960 election closely, has become more or less obsolescent by 1968. It is more probable than not that the basic relationships among Pennsylvania's counties have not undergone sweeping changes since 1960, but only intercensal interpolation and analysis of 1970 data, once it is available, can settle this question.

We have already noted that a power function model generates rather less explanatory power when correlated with major-party percentages than the additive model when one takes variables one at a time. The same relationship, not surprisingly, obtains when the model is extended to several variables. Taking the 1960 case, the pattern of Table 10 is instructive.¹⁹ As is evident, there is little to choose between the aggre-

gate explanatory capacity of these five variables in additive or multiplicative form. What is of considerable interest, however, is that the relative importance of each variable judged by a partial correlation criterion, results in radically *different* interpretations in the two forms. In the additive case, ethnicity looms large as the single most important of variables, with party coming in a close second. But in the multiplicative case, the party variable is clearly predominant. Which is to be preferred?

The literature in the field—particularly the survey literature—places great stress upon the relevance of group-related characteristics in determining both party identification and voting choice by individuals.²⁰ Indeed, there are some spectacular recent examples, for instance in the voting behavior of Baltimore Negroes between 1964 and 1968, in which race not only virtually determined electoral choice but also assumed clear supremacy over party identification under conditions of conflict between the two.²¹ On a

¹⁹ Patterns for major-party voting in 1964 and 1968 are similar to this.

²⁰ See, e.g., Philip E. Converse, "Religion and Politics: The 1960 Election," in Angus Campbell *et al.*, *Elections and the Political Order* (New York: Wiley, 1966), pp. 96-124.

²¹ The 1966 Democratic gubernatorial candidate

speculative basis, we may conclude that the 1920 Republican landslide in all probability involved similar movements among ethnic voters, notably Germans and Irish Catholics. At this late date the argument that voters are anchored to partisan politics by a pre-existing network of primary and reference group relationships hardly needs elaborate defense.²²

On the other hand, what rationale can be given for the proposition that party identification itself may predominate? While there is little point in elaborating what may be a chicken-and-egg argument, there is considerable evidence to support the view that party cannot be appropriately viewed as an exclusively dependent variable in the United States. Surveys have pointed to the significance of party identification, however established initially, in acting as a selective filter for the individual's cognition of political objects; so much so, indeed, that the availability of voters for shifts in accordance with short-term stimuli seems to be inversely and monotonically related to the strength of their perceived party identification.²³ At the extremes of strong party identification, movement can hardly occur except in the very rare case, like the Maryland 1966 election, in which the individual perceives a direct attack by his party and its candidates on his core group-related identity and values. Moreover, the electoral strategies employed by party leaders are frequently designed to prevent the erosion of party-identified perceptions and behavior by reactivating group hostilities and reinforcing the preceptual link between group and party.²⁴ Fi-

nally, one of the most dominant characteristics of party identification, one which has been abundantly demonstrated for the current period by survey methods and for earlier times by aggregate analysis, is its extraordinary *durability*. Once it is brought into being, it persists as a semi-autonomous determinant of perception and choice over long periods of time, and long after the group-related stimuli which brought it into being have faded from view. As Key and Munger pointed out ten years ago in their study of Indiana politics in the 1868-1900 period, the origins of American partisan commitments are frequently far more obscure and localized—ever disaggregated down to the family level—than would be suspected by advocates of simple socially deterministic cause-effect relationships. The truth of the matter seems to be, as Lee Benson has forcefully argued, that American voting behavior is chiefly marked by its *pluralism*. Not least among the attributes of this pluralism is the heterogeneity of predispositional factors which enter into partisan identification and partisan voting.

The point of this argument is not to make a choice between two possible "explanations" (ethnicity more important than party or conversely, party more important than ethnicity), but to emphasize that each describes an important aspect of political reality under American conditions. The implication of different results in the two models is literally that form is substance. The additive model yields results which tend to stress the salience of group-related characteristics; the multiplicative model suggests unambiguously the supremacy of party as such as an explanatory variable. That this should be so suggests first, that which model is selected may well be a legitimate matter for research strategy, and second, that it may be very profitable for the investigator to set up comparative tables of partials and multiples, using each mode.

Our finding for the major-party vote thus far is that the additive model is superior in overall explanatory power to the multiplicative. In other words, aggregate voting behavior associated with major-party coalitions in Pennsylvania, whether measured in individual elections or over time, displays characteristics which are roughly inverse to those described by Soares and Hamblin for the "radical-left" vote in Chile. But

received about 6% of the black vote in Baltimore, running as he did on an explicitly closed-housing platform. This contrasts with an approximately 97% Democratic of the two-party vote in 1964 and an approximately 93% Democratic of the three-party vote in 1968 in Negro precincts of Baltimore City. One of the ironies of contemporary American politics is, thus, that Negroes played a decisive role in the chain of events which was to elevate Spiro T. Agnew to the Vice-Presidency of the United States.

what effects are generated by a major third-party protest effort?

When we turn to the Wallace vote in 1968, the first salient point that can be noted from Table 9 is that its county variance is incomparably lower than the lowest major-party variance—indeed, this third-party variance of 1968 seems to be lower than in the case of any other third party casting 5% or more of the total vote in this state's electoral history—and that, as could be expected, the discrepancy between the county mean and the statewide total vote for Wallace is extremely low. In this context, it seems of particular significance that a critical differentiation occurs in the relative explanatory power of the two forms of regression model, as indicated in Table 11.

TABLE 11. THE WALLACE VOTE OF 1968:
A DEVIANT CASE?

Predictor Variables* (1960 Data)	Partial R ²	
	Additive	Multi- plicative
Foreign Parents	.07	.12
Democratic Registration	.02	.03
Non-white	.01	.14
High-school Graduate	.02	.00
Rural-farm	.01	.00
Multiple R ²	.07	.27

* All variables are measured in percentages.

Two aspects of this table are of paramount importance. In the first place, the county-level correlation of Wallace's percentage of the three-party vote with any available predictor variable

is extraordinarily low, as is its correlation with any major-party vote in the 1960-68 period.²⁶ This is another way of saying that this vote cut directly across all major socio-political cleavages in Pennsylvania. Viewed in terms of this sub-universe of counties, it was a "wild vote." The inference is strong that individual responses outside ordinary group contexts were of unusually great significance in the building of Wallace's vote in this northeastern state.

George Wallace's support among Southerners and among blue-collar workers in northern cities is well known from the results of surveys and the analysis of aggregate data at the precinct level. As Table 12 reveals, this is clearly the case when the minor-civil-divisions of two counties of the Philadelphia metropolitan area are examined. Unfortunately, minor-civil-division data

²⁶ Research which has just been completed by several of our graduate students but not yet verified suggests the existence of similar interactivity in the Wallace vote in Georgia (43.4% of the total) and also in voting in Quebec for Real Caouette's *ressentiment*-oriented Social Credit movement in 1962. In the latter case, the vote for Progressive Conservative candidates was similarly analyzed as a "control"; the additive form of multiple correlation apparently had slightly greater explanatory power so far as Quebec voting for this Canadian major party was concerned.

²⁷ This table's fourth column includes the following Pennsylvania urban-metropolitan counties: Allegheny, Beaver, Berks, Bucks, Cambria, Cumberland, Dauphin, Delaware, Erie, Lackawanna, Lancaster, Lehigh, Luzerne, Montgomery, Northampton, Philadelphia, Washington, Westmoreland and York. The other three columns are based on minor-civil-division data for the counties concerned.

TABLE 12. LEVELS-OF-ANALYSIS DIFFICULTIES? CORRELATION OF SOCIO-ECONOMIC
AND POLITICAL VARIABLES WITH WALLACE VOTE, 1968²⁷

Category Correlated	Delaware Co. Pa. (N = 49)	Camden Co., N. J. (N = 33)	Luzerne Co., Pa. (N = 49)	Urban-Metropolitan Counties, Pa. (N = 19)
<i>Occupations (% of Males in Active Labor Force, 1960)</i>				
Professional-Managerial	-.795	-.776	+.219	+.114
Clerical-Sales	-.567	-.698	-.349	-.131
Skilled, Semi-Skilled	+.872	+.822	-.129	-.060
Unskilled, N.A.	+.123	+.353	+.231	+.038
<i>Political Behavior</i>				
% Democratic, 1960	+.503	+.757	-.527	-.172
% Democratic, 1964	+.351	+.595	-.453	-.354

for the 1968 election in Pennsylvania came to hand too late to be fully used in this study; but it would appear that similar relationships also obtain in white communities of the Pittsburgh metropolitan area. But they tend strongly to wash out at the county level, even when analysis at this level is confined to the nineteen largest SMSA counties in the state. To what extent does this represent a levels-of-analysis problem?

One may begin by noting that among Pennsylvania's metropolitan counties, the Wallace vote ranges from a high of 11.2% in Allegheny county to a low of 3.1% in Lackawanna, a county fully as "urban" in the gross census definition of the term as is Allegheny.²⁸ This suggests at once that, even if the relationships between the Wallace vote and class-party variables were similar from one county to another at the most minute level of aggregate analysis, the intercepts if not the slopes of the regressions would be quite diverse. A minor-civil-division correlation which lumped together stratification patterns which were generally similar but of wide geographical dispersion would produce a pretty severe erosion of the size of these correlations. Thus, for example, the Wallace percentage in a minor-civil-division in Lackawanna or Luzerne counties which had 50% of its male labor force in skilled or semi-skilled occupations would

cross-county correlations at the subunit level would reflect such local variations. Indeed, when the 122 minor divisions of four New Jersey metropolitan counties are so analyzed, this is precisely what we find.²⁹

Moreover, one key to the problem seems to be provided by the results in Luzerne county. Here Wallace won 4.8% of the vote. Correlation of the Wallace percentage with occupational and political variables among its 49 comparable subdivisions yields a result which is both radically dissimilar from those of the two Philadelphia metropolitan-area counties and rather close to that yielded at the county level for Pennsylvania's metropolitan areas as a whole. A variety of explanations can no doubt be advanced for this

²⁹ If one executes a simple linear correlation program with two independent variables—percentage professional-managerial and percentage skilled and semi-skilled in the 1960 male labor force—it can at once be seen that (a) very significant differences exist in the regression equations, the partials, the beta weights and the R²'s for four New Jersey counties at this level; and (b) an aggregation of the minor-civil division units of these four counties, taken together, yields an R² which accounts for only three-fifths of the variance. The arrays look like this:

County	N	r _{12,3}	r _{13,2}	r _{23,1}	b ₁	b ₂	R ²
Bergen, N.J.	61	-.868	+.907	-.945	-.103	+.810	.824
Camden, N.J.	33	-.825	+.821	-.934	-.455	+.396	.701
Hudson, N.J.	12	-.624	+.331	-.572	-.647	-.040	.391
Passiac, N.J.	16	-.513	+.483	-.648	-.346	+.258	.302
Four N.J. Counties	122	-.665	+.766	-.801	-.146	+.649	.594
Metro Counties, Pa.	19	+.114	-.060	-.766	+.164	+.065	.015

The regression equations are:

County	Y _c =
Bergen, N.J.	0.501 - 0.021 X ₁ + 0.163 X ₂
Camden, N.J.	11.346 - 0.214 X ₁ + 0.166 X ₂
Hudson, N.J.	18.790 - 0.523 X ₁ - 0.029 X ₂
Passiac, N.J.	7.247 - 0.119 X ₁ + 0.106 X ₂
Four N.J. Counties	-0.143 - 0.059 X ₁ + 0.253 X ₂
19 Metro Counties	4.348 + 0.086 X ₁ + 0.032 X ₂

county subunit with 30% or even less; and tend to be equivalent to that of a Delaware

²⁸ The Wallace vote in these metropolitan counties ranges from 3.1%, 4.1%, 4.2%, and 4.8% in Lackawanna, Lehigh, Northampton and Luzerne counties, respectively, to 9.8%, 10.6%, 10.7% and 11.2% in Beaver, Washington, Bucks and Allegheny counties, respectively.

Thus, while it is clear that a positive relationship exists between the magnitude of the Wallace vote and the percentage of blue-collar workers in New Jersey minor-civil-divisions, there is considerable variability in this relationship between the divisions in one county and another. The amount of variance in the Wallace vote which is accounted for by these two variables ranges from less than one-third to more than four-fifths.

striking divergence—for example, the durability and strength of ethnic and religious polarizations within this anthracite county, its geographical remoteness from conurbations despite its intense urbanization, and the absence of more than a trace of blacks in the population. Whatever the relative weighting which may be given to these and other possible hypotheses, the key point for our purposes is that both the intercept and the direction of the slope of the regression are utterly different as between Luzerne and Delaware counties. It is thus evident that the hypothesis of heterogeneity in the Wallace vote has validity even in the metropolitan areas of the state; the heterogeneity becomes more marked, of course, when nonmetropolitan and nonurban sources of Wallace support are added and patterns are studied for the state as a whole at the county level. Thus, while it may be the case that the low correlation of the Wallace vote with our predictor variables at the county level may involve a levels-of-analysis problem to some extent, clearly something more substantive is also present. This impression is merely reinforced by contemplation of such outcomes elsewhere as the 25.7% of the vote won by Wallace in Payette county, Idaho; his 20.8% in Alaska's 10th Election District; his 27.5% in Esmeralda county, Nevada; or, on the other hand, his failure to achieve even 5% of the vote in such Massachusetts proletarian centers as Fall River, Lawrence, New Bedford, Revere or Somerville.³⁰

Secondly, the Wallace vote of 1968 provides the only convincing evidence in our series of the presence of interactive effects along the lines suggested by Soares and Hamblin. These effects, not surprisingly, are concentrated inversely between the ethnic and racial variables. It is very clear, of course, that the improvement in explanatory power by shifting from additive to multiplicative form of correlation is considerably less in absolute value than was found in the 1952 Chilean case. Even so, a result which produces a threefold increase in the explanatory power of our variables is not to be derided. That it exists at all in American conditions—far removed indeed from the world of the “radical left” in a relatively underdeveloped country—is significant enough. That it represents the only contempo-

rary evidence of interactivity or interdependence among the predisposing variables which we have for American voting behavior is still more so. That the interactions can be traced to two variables which could intuitively be expected to interact under current conditions of escalating racial tension is gratifying—though, of course, only from an analytic point of view.

V. SUMMARY AND CONCLUSIONS

(1) *The structure and implications of the findings.*

The analysis performed here appears to cast significant light upon several major aspects of aggregate voting behavior. In the first place, we have discovered evidences of all three forms of relationships suggested in Table 1 in recent American voting behavior. The “normal case” appears to be one in which the predictor variables are more or less independent of one another. In contemporary major-party voting—at least in Pennsylvania—multiple correlations based on simple additive models appear to explain more of the variance than can be explained with a multiplicative power function model. This appears to be confirmation on the aggregate level of the proposition advanced by the authors of the Simulmatics study that predispositional factors at the individual level summate rather than multiply in the normal American case. Secondly, when we attempted to construct completely random, arbitrary “environments” composed of groups of individuals in the 1964 SRC sample, the result was a set of correlations consistent with the independence of environmental factors. Thirdly, the Wallace vote of 1968 stands out as a phenomenon which is quantitatively unique in this series, and which more closely resembles the 1952 vote of the “radical left” in Chile—and possibly the 1962 “radical right” in Quebec—than it does the apparent American norm. Finally, there are two methodological points which are worth considering: first, it is clear on both logical and empirical grounds that there is no across-the-board “black magic” in logarithmic transformation; and second, there may be a significant ambiguity which cannot be resolved on *a priori* grounds between the relative explanatory power of the contributing variables in additive and multiplicative forms, even when the multiple correlations are approximately the same.

Let us turn to the substantive implications of these findings, beginning first with the “normal case.” It seems reasonable to suppose that the rather clear superiority of the additive to the multiplicative form of regression model as applied to voting for American major parties is related to some of their salient traditional char-

³⁰ The Wallace percentages in these cities were: Fall River, 2.9%; Lawrence, 3.9%; New Bedford, 4.1%; Revere, 4.8%; Somerville, 4.3%. Impressively, it appears that the same general pattern of relatively greater Wallace penetration in blue-collar areas than in middle-class areas obtains in Massachusetts as in Pennsylvania and New Jersey. But both the intercepts and the slopes probably vary considerably from those for either Delaware or Luzerne counties.

acteristics. The first of these is that the major-party formations in the United States have normally been grounded on political oppositions which in most other societies would be described as marginal. These parties have both contributed actively to the maintenance of a massive national value consensus which emphasizes the primacy of the private over the public, the individual over the collective. This value system is probably the closest approximation to eighteenth-century Whiggish liberalism now in existence. It is hardly too much to say that the American political system as a whole, with its extraordinary diffusion of political power, makes sense only as a structural precipitate of this pervasive liberal *Weltanschauung*.³¹ Not surprisingly, the coalitional structure of the established political parties in a two-party system in this primordially liberal society is not specific to class, confessional or other polarizations. Of course such polarizations exist and are reflected in the structure of mass party identification and voting behavior; but they exist in a party system which has aptly been classified on comparative criteria as *heterogeneous*. This heterogeneity implies that there is a protean, labile quality to American voting coalitions that is rather unusually marked in western systems of electoral politics, and, in policy terms, ties in nicely with Theodore J. Lowi's observations that "... American parties represent outcomes *in general*; parties seldom shape or represent outcomes *in particular*."³² In short, their coalitional structure no less than their organization, presupposes the normal absence of "hard oppositions" of the sort found in European politics; and it precludes any very effective coalescence of voting groups in a mass-based effort to capture the apparatus of state for positive social-transformation purposes. This too is reflective of a liberal political system one of whose most fundamental characteristics is the denial, both in theory and in operational terms, of internal or domestic political sovereignty.

Such an interpretation of American politics carries with it some clear implications for its electoral-politics subsystem. There is no question that the threshold-of-representation features of the American electoral system—in particular the indivisible but immensely important office of the Presidency—have been enormously influential in maintaining and reinforcing a two-

party norm in the United States.³³ But, important as they are, they do not absolutely determine the dominance of two and only two parties in the United States, much less the long-term trend over the past century for third parties to disappear, or the extent to which—both in political rhetoric and in the electoral laws of certain states such as Ohio and Nebraska—the two-party norm itself has increasingly become part of an "American celebration" in this century.

The persistence of this two-party norm, and most other of the salient peculiarities of American major-party politics for this matter, may perhaps best be explained by the thesis that questions of party or electoral politics in this country have not for the most part been questions of power. Putting the matter another way, electoral politics and voting are very rarely widely perceived here as vehicles for attacks upon any basic aspect of the social order. On only a very few occasions in our history have internal social tensions escalated to the point where serious efforts have been made to use electoral politics as a means for achieving sweeping redistribution of policy outcomes. These, of course, have been indissolubly associated with critical realignments.

The American two-party system, in short, is formed of two structural elements which share a common and most important political characteristic: the continuing supremacy of the traditional liberal middle-class value-system as it becomes concretized in terms of political demand, and the phasing out, non-recognition of morselization of potentially disruptive political demand. Such a structure and the value-system which it reflects do not preclude the existence of high levels of tension and violence in American society, but they do normally rule out the expression of active or aggressive political alienation through major electoral-politics instrumentalities.

In such a context, Theodore J. Lowi's argument that American parties are constituent rather than policy-making is reinforced.³⁴ What that constituent function is may perhaps be restated here: it is to contribute to the maintenance of a high wall of separation between society and polity in the interest of maximizing private, *i.e.*, middle-class, decision-making in the former. It follows from this, first, that under normal circumstances major-party electoral politics becomes something of an end in itself rather than a politically directed transformation in society which the majority coalition may think desirable; and, second, that this

³¹ For fuller elaboration of this argument, see Walter Dean Burnham, *Critical Elections and the Future of American Politics*, *op. cit.*, Chapter 7.

³² Theodore J. Lowi, "Party, Policy and Constitution," in William N. Chambers and Walter Dean Burnham (eds.), *The American Party Systems* (New York: Oxford, 1967), p. 263.

³³ S. M. Lipset and S. Rokkan, *Party Systems and Voter Alignments* (New York: The Free Press, 1967), pp. 1-64.

³⁴ Lowi, *op. cit.*

would be reflected in aggregate terms: that, for example, correlations based upon additive models would explain more of the variance in "normal" American electoral politics at the mass base than would correlations which reflected strong interactions among predisposing social variables.

It may be here, by the way, that a possible explanation may eventually be found for the kind of semi-autonomous, extraordinarily durable and socially heterogeneous structure of party identification or aggregate party alignment which is found in the United States, and which our data has also suggested. For if the structure of traditional party identification has much to do with marginal differentials in policy outcomes and major differentials in ethnocultural prestige and recognition, it would be entirely to be expected that once set in motion, such identifications and alignments would have tremendous endurance over time and little clear relationship to policy outcomes.

(2) *Alienation and Multiplicative Power Functions: Wallace and 1968.*

The durability and marginality of American major-party operations bears with it a remarkable political stability. This stability has its price, however. It is becoming rather clear that there is a recurrent dynamic in American electoral politics; in particular an apparent oscillation, punctuated by third-party protest movements, between long-term stable phases and short but intense patterns of realignment. Very probably this peculiar pattern is a direct outgrowth of the interaction between the static, nondevelopmental or nonadaptive behavior of major-party elites, followers and structures on the one hand and a rapidly changing, politically largely unfettered socio-economic system on the other. Emergent political demand arising from these incessant social transformations tends in this political system not to be aggregated by the practitioners of a fairly closed producer-oriented, end-in-itself

kind of electoral politics, until the demand has had time to reach explosive proportions. The eventual results scarcely conform to what might be expected from the equilibrium models which have often been used to analyze American politics.

That 1968 was not a year marked by profound nationwide realignment at the mass base is fairly obvious—our Pennsylvania major-party data indicate as much. But it was an election year which would rank close to the top of any imaginable scale which might measure the intensity of intergroup tensions, discontent, and aggressive hostility directed by significant elements of the public against existing institutions and leaders. Electoral politics had to compete directly through the year with the politics of direct action and confrontation up to the well-barricaded gates of the Democratic national convention itself. Insurrection within the Democratic coalition against the Johnson Administration took on such major proportions that a Republican presidential candidate could win a mere four years after one of the worst defeats in his party's history. Finally, of course, a third-party coalition of *ressentiment*, based on racial hostility and on the hostility of the periphery toward the center, won 13.6% of the three-party vote. This, it should be noted, was the second-best showing in American political history for any third-party movement which was not clearly associated with formal ruptures in the organizational structure and mass following of one of the major parties. It represents an exceptional, if regionally-concentrated, "act of aggressive hostility" against the leaders, parties and policies associated with the existing political order.³⁵

³⁵ Partitioning of the country between the "Greater South" (the eleven ex-Confederate states plus Oklahoma and Kentucky) and the remaining parts of the country reveals the following patterns in major third-party years since 1892:

Year	Greater South			Non-South		
	% D	% R	% Oth	% D	% R	% Oth
1892	37.9	27.3	14.8 Pop.	44.4	48.4	7.2 Pop.
1912	61.3	17.7	16.1 Prog. 4.9 Soc.	39.1	24.7	29.9 Prog. 6.3 Soc.
1924	60.0	34.2	5.8 Prog.	24.2	57.3	18.5 Prog.
1948	52.3	29.7	17.5 S.R. 0.5 Prog.	49.4	47.9	0.0 S.R. 2.7 Prog.
1968	31.5	36.0	32.6 Wall.	46.3	45.8	7.9 Wall.

It is probably appropriate to view the Southern wing of the Wallace movement as the latest, if one of the greatest, in a series of periphery-oriented revolts against a cosmopolitan center—revolts which have deeply involved, although they have been far from coextensive with, responses to efforts from the center to define citizenship in the American polity uniformly as between the races and as between one region and another. In this respect, the Wallace movement can be seen as an authentic continuation of an old regional tradition, a tradition in which colonial resentment against a dominant metropole or resistance to the periphery against the center's efforts at coordination is inextricably bound up with issues involving race relations. Thus, we find that in Oklahoma the Wallace vote is visible and positively correlated with the Socialist vote in the 1914 election, and particularly with the mean Democratic percentage of the total vote between 1932 and 1948.³⁶ It is also worth noting, however, that here the Wallace vote also reflects a pattern similar to that found in Pennsylvania: its variance is less than half of the 1914 Socialist variance, and one-third as large as that of the 1932-1948 mean percentage Democratic.

If it is the case that even border-South states

Not only does the Wallace movement represent the largest Southern third-party insurrection since 1860; it is surpassed in the *non-Southern* states since that date only by the 1912 and 1924 Progressives.

³⁶ The partial correlation of % Wallace with % Socialist in 1914 is +.316, while it is +.618 between % Wallace and mean % Democratic, 1932-1948. The latter two correlate at +.531. The relative significance of the former in correlations with the Wallace vote is clearly very small compared with the latter: $b_1 = -.017$, while $b_2 = +.627$. R^2 for both predictors = .382. Neither the partials nor the R^2 are quite as large as might have been supposed *a priori*. This corresponds to the fact that the Wallace vote was much more uniformly distributed across the state's 77 counties than were either the 1914 Socialist vote or the 1932-1948 Democratic vote. Thus, the variance for the Wallace vote was 43.52 and the standard deviation 6.60; for the 1914 Socialist vote (with a mean almost identical with the Wallace mean in 1968) the variance was 97.73 and the standard deviation 9.89; and for the 1932-1948 mean Democratic percentage the two figures were 119.69 and 10.94 respectively. The data for the latter measure were taken from Oliver Benson *et al.*, *Oklahoma Votes* (Norman, Oklahoma: Bureau of Government Research, University of Oklahoma, 1964), p. 18.

such as Oklahoma yielded substantial shares of its vote to the 1968 insurrection against the established political order, it seems clear that the Northern wing of the movement was less "respectable" than the Southern. It seems reasonable enough to suppose that the Wallace vote in the North was composed essentially of a hard-core residue of voters who were strongly alienated from, and actively hostile to, the candidates of both major parties. The larger regional sub-cultural context in which they lived was not very supportive to their commitment to Wallace. Thus it appears quite reasonable to view the non-Southern Wallace vote as essentially a "radical" vote, indicating a very high intensity of political dissatisfaction by American standards.

Recapitulating our findings for Pennsylvania, we have suggested, first, that the Wallace vote correlated very weakly with all of our variables in the additive form, and that it alone revealed persuasive evidence of interaction among the "independent" variables. Such findings are entirely consistent with two hypotheses. (1) Viewed at least on the aggregate level of the county, this cutting across most or all traditionally significant group-related variables is probably indicative of a mass base which has an abnormally large component of idiosyncratic, negative, or "alienated-voter" elements. (2) The interactivity disclosed in the multiplicative model and involving two of our set of variables suggests the possibility that a "multiplicative power function" exists for this vote, and is associated with nonwhite and foreign-stock population elements. Is it possible that this is in turn linked in some way to the existence of some sort of abnormal involuntary-response phenomenon among these voters but not, it would seem, among voters for the major, "non-radical" parties?

The emergence of the Wallace movement as a mass-based phenomenon would probably be enough, taken alone, to indicate the presence of an abnormal, if perhaps transitional, stress on the American political system as a whole. If there is any one characteristic of that system which stands out above any others, it is probably its enormous inertial stability as an institutional and behavioral structure. Such stability in turn probably dependent upon at least two conjunctures for its survival. The first of these is that our historical privatizing consensus, with its encouragement of disaggregation or "incrementalization" of policy outputs, continues to dominate the political culture. The price which this middle-class individualist consensus has exacted has been very high, particularly among the disadvantaged at the bottom of the social structure.

who have been largely virtually excluded from political participation in any form from the turn of the century until very recently.³⁷ But this consensus has worked admirably over the years to inhibit the rise of seriously dissonant political demand by inhibiting awareness of political man as a member of some collective sub-national entity rather than as an atomized individual acting in a political, economic, and social marketplace.

The second conjuncture which seems required is a negative one: that developments in society itself not be such as to raise overt or widespread doubts about the relevance or universality of this value consensus. Our great political upheavals of the past have apparently involved interactions between a dynamically transforming socio-economic system and a highly stable, if not static, political system. Such interactions have brought in their wake glaring and growing discrepancies between parts of the then-current American political formula and the exigencies of emergent political demand. Such also seems to be the case at the present time. But it may well be that the now well-known transformations which have occurred over the past generation in the demographic, social and economic structure of the United States have produced conditions in which the core values of this traditional individualist belief system are themselves brought into question. The major problems confronting the American polity at the present time—racial consciousness and racial antagonism, the galloping decay of the central cities, pollution of the human environment and so on—seem to arise directly from either or both of two sources: the rapidly growing dysfunctions of private-decision supremacy in the socio-economic system on the one hand, and the tendency among decision-makers to deal with collectivity problems—particularly, but not exclusively, those involving race—in morselized, individualist-liberal terms on the other. If so, then resolution of these problems may well require, among other things, some form of massively expanded central political control over and channeling of private decisions in the society and economy. Such expansion seems incompatible with the core premise of the traditional American political formula—the separation of political and social life, the dominance of private decisions in the latter sector, and the dispersion of internal sovereign power—and hence with the deeply-established behav-

ioral and institutional structure and routines of American politics.

In Chalmers Johnson's terms, the dissynchronization which develops between political values and behavior on one hand and social transformation on the other has produced a condition of "power deflation" in the United States.³⁸ This is reflected in overt challenges to the legitimacy of hitherto-accepted political institutions and routines by growing segments of the public; in a widespread and increasingly self-conscious—hence aggressively hostile—political alienation which is scattered among the public and concentrated among newly politically mobilized minorities; and in perceptible increases in the magnitude and intensity of anomic behavior of an antisocial, though not necessarily political, type. It is in such periods, periods like the present, that patterns of voting can be found which diverge sharply from the "norm" identified by the voting studies of the 1950's, as well as other kinds of politically relevant behavior for which there are scarcely any domestic references at all from the literature of the 1950's. It would hardly be surprising if such patterns involved widespread responses to political stimuli of the sort which Soares and Hamblin found in a very different political and social system. In the case of the Wallace vote in Pennsylvania, they apparently do. It is, unfortunately, more than likely that the near future will reveal other instances of "acts of aggressive hostility" for scholars to examine.

(3) *Implications for further research*

Our findings, particularly when taken in tandem with the Soares-Hamblin study, suggest with some clarity that multiple correlation analysis based on interactive theoretical models is highly useful and might well be employed in a wide range of comparative studies of aggregate voting behavior. There are a number of questions regarding such use which remain unanswered.

One of these might be called the question of the "institutionalization" of a definably radical vote. Allende, for example, made his first of several bids for the presidency of Chile in 1952, winning 5.5% of the vote. By 1958 his vote had risen to 28.9%. It would be useful to ascertain whether, as the base of Allende's coalition expanded, the multiplicatively written variables retained the clear superiority of explanatory power in 1958 which they had over their additive form in 1962. It would be similarly desirable to learn whether the radical vote in other

countries with a tradition of electoral support for the far Left which is both stable and substantial—France and Italy, for instance—manifest similar evidence of multiplicative relationships.

A second area of uncertainty which might profitably be studied is the possibility that the vote for stable clientele parties in multi-party systems might generally fit into the "interactive" end of our paradigm, while the vote for more broadly-based "portmanteau" parties of a majority bent might display non-interactive characteristics similar to those associated with American major-party voting. One very recent discussion of German electoral politics has developed a finding which is particularly intriguing in this context: that the absolute magnitude of the vote for the CDU is strongly and inversely related over time with the absolute number of non-voters—in other words, that it has the same sawtooth characteristics as between "general" and "off-year" elections in the 1949-65 period as does American major-party voting—while the SPD vote in the same period describes an almost completely smooth linear increase.³⁹ Does this phenomenon indicate the kinds of differences in mass electoral support which can be captured by multiple-correlation analysis based on interactive models?

Finally, let us return to the American case. The discovery that the multiplicative model has greater explanatory power for the 1968 Wallace vote than does the additive raises a number of significant questions. Transitional stages marked by major third-party efforts and by rapid escalations in ideology and politically-related violence are not unique to the 1960's, but seem to have periodically recurred throughout American electoral history. Duncan MacRae, among others, has noted that major third-party movements seem to be integrally related to the processes of realigning change in the system, and serve as halfway houses for large numbers of voters who are en route from one major-party commitment to another.⁴⁰ While generalization is a tricky business, it may be suggested that, on the whole, such third-party movements have in the past tended to occur during the earlier stages of realignment.

If an appropriate model of American electoral politics over time is that of dynamic transformation, with interactions between long-term sta-

ble phases of party alignment and short-lived but massive bursts of realignment, it would be reasonable to hypothesize that predispositional factors entering into aggregate voting behavior would undergo sweeping changes associated with the realignments. In conjunction with this, certain questions can be asked.

(1) Is the superiority of the additive to the multiplicative theoretical form in explaining American major-party voting a constant or universal phenomenon? Or, on the other hand, might there be systematic differences in the relative explanatory power of the two forms dependent upon the existence or the absence of political realignment in the period being examined?

(2) Granted the development of an unidirectional set of changes in American voting behavior during the period 1904-1920, was the nineteenth-century major-party vote as clearly non-interactive as it is at present, or were the relationships between the explanatory capacity of the additive and multiplicative forms significantly different even during "stable phases" from the present?

(3) Does voting for other and earlier third party protests reveal a superiority of multiplicative to additive models similar to that of the Wallace vote in Pennsylvania or not?

Assuming that the theoretical argument developed by Soares and Hamblin is at least oriented in the right direction, assuming further that there is no as yet undetected factor which would serve to cast doubt upon the validity of the technique used, and assuming finally that the propositions presented here about American electoral politics are generally valid, it is easy enough to construct the following set of hypotheses. (1) Electoral alignments under "stable-phase" conditions will probably best be explained by an additive model, since American major parties are essentially "constituent" rather than policy-oriented, and are loose, majority-bent coalitions of horizontally linked elements. (2) Major third-party movements arise out of the failures, which tend to be cumulative, of the old party leadership to aggregate emergent political demand. It may be supposed (a) that where such third-party movements can be identified as organizational fractures of one of the two older party organizations, as with the Democrats in 1860 and the Republicans in 1912, the vote for these third parties will be approximately as strongly additive as the vote for the parent party in the same or contiguous elections; and (b) that where such insurgent movements arise as "grass-roots phenomena" outside the leadership-organizational structure of the two old parties, as in 1892, 1924, or 1968, multiplicative relationships may prove of greater

⁴⁰ Duncan MacRae, Jr., and James A. Meldrum, "Critical Elections in Illinois: 1888-1958," this REVIEW, LIV (1960), 669-683.

explanatory power than additive ones. (3) Since ideological polarization seems to be a manifest characteristic or realigning elections at the level of elites, and since such elections produce abnormally large shifts in the mass base of support for the two major parties, it is plausible to suppose at the very least that the superiority of the explanatory power of additive correlations over multiplicative ones is drastically and systematically reduced in such periods. It may even be

the case that significant evidence of interaction among predisposing variables will be found for one or more of the major parties' votes in such elections.

Such hypotheses can, of course, only be tested by further research. As of now, however, the prospects seem good that the techniques discussed in this article will prove useful in increasing our understanding of the process involved.

APPENDIX

The two tables below report more completely the data for footnote 17.

TABLE A1

Pennsylvania: Measures of Central Tendency and Dispersion based on Counties, 1940-1968

Year and Party	Variance	Standard Deviation	County Mean	State %	Difference
1940 Democratic*	90.11	9.49	46.6	53.5	-6.9
1944 Democratic	94.05	9.70	43.2	51.4	-8.2
1948 Democratic	103.42	10.17	41.5	48.0	-6.5
1952 Democratic	103.32	10.16	38.6	47.0	-8.4
1956 Democratic	72.69	8.53	36.4	43.4	-7.0
1960 Democratic	104.49	10.22	40.9	51.2	-10.3
1964 Democratic	59.51	7.71	60.3	65.2	-4.9
1968 Democratic (3-party)	96.57	9.83	39.7	47.8	-8.1
1968 Democratic (2-party)	111.31	10.55	42.8	51.9	-9.1
1968 Wallace	4.58	2.14	7.3	8.0	-0.7

* Percentages and the measures based on them are Democratic of the two-party vote, except in 1968.

FORMS OF REPRESENTATION: PARTICIPATION OF THE POOR IN THE COMMUNITY ACTION PROGRAM

PAUL E. PETERSON
The University of Chicago

Debate over representation has been a continuing part of the Western political tradition at least since the writings of Hobbes. Recently, Hanna Pitkin, using the tools of linguistic analysis, has clarified, if not resolved, the debate by examining the disparate uses of the term in both political and non-political discourse.¹ In order to elucidate the issues, she discussed such different forms of representation as formal representation, descriptive representation, substantive representation and interest representation. In this paper I will utilize the distinctions she has developed as a framework for analyzing the process of representation within the community action program of the Office of Economic Opportunity (OEO) during its initial formative period (1964-1966) in the cities of Chicago, Philadelphia and New York City.²

¹ Hanna Pitkin, *The Concept of Representation* (Berkeley: University of California Press, 1967).

² The field research for this paper was conducted between June, 1965 and August, 1966. All statements refer only to community action program developments prior to August, 1966. Semi-structured interviews with over 175 political actors in the three cities and in Washington, D.C. were held during the course of the research. Respondents included representatives of the poor, public officials, heads of public and private welfare agencies, civil rights leaders and newspaper reporters. In addition, the research involved detailed inspection of newspaper coverage, review of minutes of community action agency committee meetings, attendance at neighborhood and citywide poverty meetings, and examination of public and private documents. Statements in the text are thus based on the close familiarity with the program in the three communities that is achieved through discussion with a wide range of political actors. In all cases, reports of the behavior of actors is based either on written evidence or on oral evidence from several actors speaking from various perspectives. A more detailed description and analysis of the community action program in these three cities can be found in Paul E. Peterson, "City Politics and Community Action: The Implementation of the Community Action Program in Three American Cities" (Unpublished Ph.D. Dissertation, University of Chicago, 1967).

I wish to express my appreciation to the Russell

I will argue that 1) the manner of selecting representatives of the poor (formal representation) was a function of the political resources of competing interests in the city; 2) the orientations (interest representativeness) of the formal representatives affected their influence (actual representation); 3) the influence (actual representation) of the formal representatives affected the level of intra-neighborhood conflict, which in turn affected the representatives' orientations (interest representation); 4) the character of the actual and interest representation was affected by the type of formal representation; and 5) the social characteristics of the representatives (descriptive representation) influenced the character of actual and interest representation.

I. FORMS OF REPRESENTATION

The formalistic view of representation, as Pitkin described it, conceives of representation "in terms of formal arrangements which precede and initiate it."³ It was Hobbes who used *formal representation* as the lynch-pin to hold together his Leviathan, the state in which all members of the political community had authorized the sovereign to exercise for them their political rights. Representation was in no way related to the substance of the acts of the sovereign; representation inhered only in the formal arrangements which preceded these acts. Hobbes' view was altered but not fundamentally changed with the development of democratic theory; the new formula focused on elections "as a grant of authority by the voters to the elected officials."⁴ According to this view, anyone holding public office is a representative of the electorate who selected him. Formal representation, then, is representation dictated solely by the arrangements which establish the way in which the representative is selected.

Such a view enables one to specify rather easily *for whom* the individual is acting as representative. Whether or not an alderman takes a

Sage and Woodrow Wilson Foundations for assistance which made this research possible. I am indebted to J. David Greenstone, Theodore Lowi, Duncan MacRae, and Michael Lipsky for their helpful comments on earlier drafts of this paper.

³ Pitkin, *op. cit.*, p. 11.

⁴ *Ibid.*, p. 43.

narrow, parochial view or a broad, city-wide view of his responsibilities, he is still formally representative of the members of his ward, not of the city as a whole. Members of farmer advisory committees elected by farmers are formally representative of the farmers, not of the public as a whole. Individuals appointed to a labor relations board by the President formally represent the President, not the labor movement—even if they are all ex-union leaders themselves.

With such an understanding of representation it seems difficult to speak of an individual as being more or less formally representative, a difficulty which provides Pitkin with one of her reasons for rejecting as inadequate this definition of the term. This, however, is true only when speaking from the perspective of the representative. From the perspective of the constituency it is possible to say which of its representatives is formally the most representative. The criterion is the directness by which the population formally selects its representative. The more indirect the selection process, the less the formal representation. Thus, the change from electing United States Senators by the state legislature to electing them directly by the voters was a move toward greater formal representation of the voters by their Senators.

Formal representation, as the name implies, refers only to the arrangements by which the representative is selected; it in no way takes into account characteristics of the representative himself. For an interpretation of the concept that stresses the representative's characteristics, it is necessary to consider what Pitkin calls *descriptive representation*. Descriptive representation refers to the extent to which the representatives reflect accurately the characteristics of those whom they formally represent. Since no representative can reflect his constituents in all respects, it is necessary to state which characteristics determine representativeness. The representatives' social class, ethnic or racial background, age, and place of residence have all been considered by analysts and political actors as politically relevant social characteristics which affect descriptive representation. The social characteristics deemed politically relevant have no *a priori* standing, however, and in fact have changed considerably over time and from place to place. This provides Pitkin with one of her reasons for rejecting the socially descriptive definition of representation as inadequate.⁵

⁵ *Ibid.*, Ch. IV. Pitkin includes accurate reflection of political opinions as well as social characteristics within her definition of descriptive representation. Since we will confine our use of descriptive representation to considerations of social

Since neither the formal nor the socially descriptive understandings of representation refer to the substantive behaviour of the representative, additional interpretations of representation must be examined in order to develop a typology of *substantive representation*, i.e., representation which takes into account the "realm of action."⁶ Two aspects of the actions of representatives must be considered in order to assess the character of substantive representation—the representative's *influence* and his *orientation*. Ignoring momentarily the representative's orientation, it can be argued that the more influential the representative, the more effective his substantive representation. Thus, senior members of Congress argue that their position on influential committees makes them more effective representatives than their aspiring opponents would be. The degree of *actual representation* is thus a function of the representative's influence.⁷

However, influence alone cannot measure the quality of substantive representation; the extent to which the orientation of the representative is in accord with the interests of his constituents must also be assessed. But we encounter at this point a controversy of considerable complexity. Those who believe that interests of constituents cannot be known apart from their stated preferences have debated persistently for generations with those who believe that constituents have interests of which they may not be aware. Simply stated, the argument revolves around the question: Do people's *interests* include their needs as well as their wants? Although Pitkin's solution to this question is too complex to discuss adequately here, essentially she argues that

characteristics, we will call this *socially descriptive representation*.

⁶ *Ibid.*, p. 111.

⁷ Actual representation may be distinguished from symbolic representation. As Pitkin argues, "We distinguish practical activity rationally directed toward bringing about 'real' goals . . . from expressive, symbolic actions." *Ibid.*, p. 102. This latter form of representation, she says, "need have little or nothing to do with . . . enacting laws desired by the people." p. 106. Insofar as all formal representatives have the capacity to stimulate some favorable response among their constituents, symbolic representation is, to some extent, always present. Thus, where actual representation is almost nil, as it was in Chicago's community action program, it could be characterized by "only symbolic representation." In order to avoid introducing still another form of representation into the analysis, we have instead classified Chicago simply as "very low" on actual representation.

the representative must act in such a way that there is no conflict [between representative and represented], or if it occurs an explanation is called for. He must not be found persistently at odds with the wishes of the represented without good reason in terms of their interest, without a good explanation of why their wishes are not in accord with their interest.⁸

Such a position, though not unreasonable, raises considerable problems for the empirical social scientist. In trying to establish which of two representatives is substantively acting in the most representative fashion, it becomes necessary for the analyst to secure intersubjective agreement on the quality of the reasons the representative gives for his disagreement with his constituents.

This and other difficulties have led many social scientists to equate interests with preferences of individuals. The objection here, as Pitkin and others have stressed, is that such an equation departs drastically from ordinary usage of the word.⁹ One small example can illustrate this point. There is a tendency for preferences of individuals to change rapidly even when it is difficult to see any change in their interests. Such behavior is commonly referred to as changes in the individual's awareness of his interests rather than changes in the interests *per se*.

The concept of role provides a means by which this Gordian knot may be cut—at least for purposes of social analysis. A major reason for the difficulty in specifying a man's interests independent of his preferences is the complexity of factors which combine to make him a unique individual. The concept of role, however, selects out from the multitude of relationships that comprise the totality of an individual's social action and focuses on those patterns of behavior of interest to the analyst. The purpose of such a concept is to simplify for analytic purposes the subject for inquiry. Among other things, role analysis simplifies use of the concept of interest. Whereas determining the policies that are in the interest of, *i.e.*, are "good for," an individual is indeed difficult, it is a far easier task to specify policies that would enhance the desirability of performing a particular role. Policies which improve the life chances of incumbents of specific roles by increasing the wealth, power and/or prestige associated with the role serve their role interests, whether or not the role incumbents are in favor of these policies.¹⁰ Thus, the representa-

tive provides more or less interest representation for individuals performing certain roles according to the extent to which he favors policies improving the life chances of the role incumbents. In the following analysis, then, interest representation will refer only to role as distinct from personal interests.

As long as the representative's influence is so marginal that actual representation is virtually nil, his orientation is not significant for determining the form of substantive representation. When actual representation does occur, however, it is possible to specify at least three points along a continuum ranging from negative to positive interest representation. A representative whose actions are oriented against improving the role interests of his constituents may be said to

with the interests of institutions, Samuel Huntington presupposes an argument along the lines I have set forth. Huntington argues that "Institutional interests differ from the interests of individuals who are in the institutions. . . . Individual interests are necessarily short-run interests. Institutional interests, however, exist through time; the proponent of the institution has to look to its welfare through an indefinite future." "Political Development and Decay," *World Politics*, XVII (April, 1965), 412-413. But institutions are only complexes of role relations which individuals wish to sustain. In order to attribute interests to institutions, one must initially distinguish between personal and role interests. Speaking of the interests of institutions independent of the preferences of those with the authority to speak for the institution is thus perfectly parallel to speaking of role interests independent of the opinions of those occupying the social role.

Another solution to the problem of defining interests is to use the concept for heuristic purposes only. It can be argued, as does Ralf Dahrendorf, that it is analytically useful to postulate objective role interests in order to explain social conflict and social change. Ralf Dahrendorf, *Class and Class Conflict in Industrial Society* (Stanford, California: Stanford University Press, 1959), pp. 173-179. This solution rests on the explanatory power of making such an assumption about role interests. Although J. David Greenstone and I have adapted Dahrendorf's assumptions to the analysis of race conflict in our study of *Politics and Participation*, to be published by the Russell Sage Foundation, in this paper I am arguing that one can identify objective role interests on quite separate grounds. As Pitkin has pointed out, ordinary language usage justifies a definition of interest that is not simply dependent on the subjective feelings and desires of the individual.

⁸ *Ibid.*, pp. 209-210.

⁹ *Ibid.*, Ch. IX-X. Also, see Richard Flatham, *The Public Interest* (New York: John Wiley & Sons, 1966), *passim*.

¹⁰ In attempting to identify the public interest

provide *negative representation*. This category will be of no concern to us in this exercise.

Substantive action which seeks to improve the life chances of specific individuals among all those performing the designated social role may be called *particularistic interest representation*. Perhaps the best illustration of such representation is the machine politician who represented lower and working class immigrants.¹¹ In a style that accorded with particularistic norms familiar to the European villager, the friendly precinct captain could find "help" when a constituent needed emergency fuel, shoes for his children, or even a low-paying but badly needed job. Such actions, however, assist only particular individuals within a broad social classification.

Actions which seek to improve the life chance of all incumbents of the social role in question may be called *universalistic interest representation*. The welfare state, which has developed employment, housing, welfare, and health policies that have improved the life chances of the working classes, is the product of working class interest representation more universalistic in that it improves the conditions of nearly all those performing such a social role. Thus it may be said that universalistic interest representation provides *more* substantive representation than particularistic interest representation, which improves the life chances of only particular individuals within the role classification.

II. CONFLICT OVER FORMAL REPRESENTATION

The means of providing formal representation was one of the most hotly contested political issues during the formative period of the community action program.¹² Social engineers in the federal government sought to strengthen the political resources of low income and minority groups as part of the war against poverty.¹³ Relying on the requirement in the Economic Opportunity Act of 1964 that community action

programs be "developed, conducted and administered with the maximum feasible participation of residents of the areas and members of the groups served," federal officials within OEO issued regulations requesting that local communities specify the ways in which their programs would foster such participation.¹⁴ The details by which this could be achieved were difficult to specify. However, it was immediately apparent that direct mass participation in policy formulation by low income or any other residents of the city was impossible. As normative and empirical political scientists have recognized for centuries, the participation of any segment of society in decision-making can only occur indirectly through the actions of its representatives. Political conflict over formal representation developed as conflicting factions sought arrangements facilitating the selection of representatives who would act in a manner consistent with their interests. OEO's early administrative "rule of thumb," which was later written into law by Congress, required that at least one-third of the policy-making body for local community action programs consist of representatives of the poor, chosen "whenever feasible" in accord with "traditional democratic approaches and techniques."¹⁵ Even as the Congressional enactment requiring "maximum feasible participation was open to a variety of interpretations, so was this administrative guideline. Consequently, political action shifted from the national to the local arena, as local communities sought to develop a formula which both reflected power relations in the community and fell within OEO guidelines.

The mayors of New York, Chicago and Philadelphia all sought to control the appointments to the city poverty council. Robert Wagner of New York articulated the common mayoral reaction in testimony before a Congressional committee:

When I testified a year ago, I urged that the local governing bodies, through their chief executives or otherwise, should have the ultimate authority, as they have the ultimate responsibility, for . . . the conduct and operation of the anti-poverty program.¹⁶

¹¹ See, for example, descriptions of the machine in Richard Hofstadter, *The Age of Reform* (New York: Random House, 1955) and Martin Meyerson and Edward C. Banfield, *Politics, Planning and The Public Interest* (New York: Free Press of Glencoe, 1955).

¹² The analysis of the political determinants of the arrangements for formal representation, which we are only able to sketch here, can be found in J. David Greenstone and Paul E. Peterson, "Reformers, Machines and the War on Poverty," in James Wilson (ed.), *City Politics and Public Policy* (New York: John Wiley & Sons, 1968), pp. 267-292.

¹³ John C. Donovan, *The Politics of Poverty* (New York: Pegasus, 1967), pp. 41-43.

¹⁵ Office of Economic Opportunity, *Community Action Program Guide* (Washington, D.C., 1965), I, p. 18.

¹⁶ U.S. Congress, House Committee on Education and Labor, *Hearings, Examination of the War on Poverty Program*, 89th Cong., 1st Sess., 1965, p. 483.

An early unpublished document of the Richard Daley Administration in Chicago stated the mayor's position in more convoluted yet more revealing language:

Chicago believes the role of active and constructive citizenship cannot be imposed on the poor person by participation in an action committee which has ignored his personal development. That if development is postponed in order to involve the poor person immediately in committee action roles, his involvement may frequently lead to the negative involvement of protest.

Mayor James Tate echoed these sentiments in a letter to the *Philadelphia Bulletin*:

Knowledgable Philadelphians appreciate the fact that it was the city's responsibility [as distinct from that of a body including representatives selected by the poor] to . . . get the beginnings of a program underway. . . .¹⁷

While the mayors in the three cities agreed that the city poverty council should be appointed by the chief executive, neighborhood groups in low income and black communities argued for selection of representatives of the poor by community organizations. Coalitions of these community organizations in New York and Philadelphia sought to establish the principle that at least one-third of the members of the city poverty council as well as all of the members of neighborhood councils should be selected by neighborhood organizations. In Chicago no coordinated opposition to the mayor's plan for appointing representatives was ever mounted, but sporadic criticisms were levied against mayoral appointments by one or two of the better organized and more militant neighborhood groups. Significantly, at no time did neighborhood groups in any city call for direct election of the representatives to the city poverty council; in place of mayoral appointment, they preferred election at meetings of existing neighborhood organizations. Neighborhood groups, as did mayors, preferred a means of providing formal representation which they themselves could control.

Although the polarization of conflict in the three communities was similar, the eventual arrangements for providing for formal representation of the poor on the city poverty councils differed considerably. Philadelphia's process of selecting the policy-making committees for its community action program provided the most formal representation. It was decided that representatives would be elected by residents living in low income sectors of the city, which were

divided into twelve areas. The residents in each of these areas elected in May, 1965 twelve representatives who formed a neighborhood council.¹⁸ Each of these councils elected, in turn, one of their number to sit on the city poverty council.¹⁹ The neighborhood council was thus elected directly by low income area residents, and the citywide representatives were just one step removed from direct popular election.

In New York City there was less formal representation, because only organizational representatives could participate in the election of the neighborhood council. During the summer and fall of 1965, community conventions were held in twelve of the sixteen neighborhood areas into which the low income sectors of the city had been divided.²⁰ Organizations in the neighborhood were invited to send delegates to the convention, which elected representatives to the neighborhood council. The council then selected delegates to the city poverty council.

Chicago's selection process provided the least formal representation of the poor in the community action program. The neighborhood council was appointed by the director of the local neighborhood service center, who also selected the delegate from his neighborhood to the city poverty council.²¹ Since the director was chosen by the executive director of Chicago's poverty program, a political appointee of the mayor, the representatives were indirectly selected by the mayor.

These varying arrangements for formal representation of the poor reflected the balance of power between the mayor and the organized voices of the black community. The neighborhood groups were in the strongest bargaining

¹⁸The proper name for these councils varied from city to city. For purposes of simplicity and in order to emphasize inter-city comparisons, we shall refer to all of them as "neighborhood councils."

¹⁹Again, I am avoiding the use of proper titles.

²⁰Procedures in the other four areas were even less formally representative; community leaders came together, formed an organization, and were recognized by the City as the policy-makers for the community action program in the neighborhood.

²¹Toward the end of my research, in the spring of 1966, it seemed that at least one representative from each neighborhood to the city poverty council would soon be chosen by the council instead of the director.

We are substituting a more general descriptive name for the proper title of Chicago's service centers in order to emphasize inter-city comparability.

¹⁷Emphasis added. *Philadelphia Evening Bulletin*, February 8, 1965.

position in New York City, because the political leader supervising the poverty program was seeking vital political support from liberal and civil rights organizations in a closely contested mayoral election.²² In Chicago the lack of significant opposition to a mayor supported by a powerful political machine deprived community groups of essential allies; anticipating the strength of their opponent, they failed to mount a sustained drive for greater control over the selection of representatives.²³

Interestingly enough, Philadelphia's elections, which were given nationwide newspaper publicity, were a compromise that was the first preference of neither the mayor nor the neighborhood groups. A black political ally of the mayor advocated elections as a means of curtailing criticism of mayoral dominance without giving the protesting organizations control of the program. The proposal split the coalition of neighborhood groups, some of whom boycotted the elections, some of whom sought to elect their members to neighborhood councils. The compromise reflected the political support for the mayor, who was stronger than New York's but weaker than Chicago's.²⁴ He felt he must obviate sustained public criticism, but he did not believe it necessary to capitulate to demands for representation by the organized opposition.

III. SUBSTANTIVE REPRESENTATION: THE INFLUENCE AND ORIENTATIONS OF THE REPRESENTATIVE

These varying patterns of formal representa-

²² The declining political strength of the New York City mayor, who must contend with a virile reform movement, is described in a number of penetrating analyses of New York politics. See Wallace Sayre and Herbert Kaufman, *Governing New York City* (New York: W. W. Norton and Co., 1965); Theodore J. Levi, *At the Pleasure of the Mayor* (New York: Free Press of Glencoe, 1964); James Q. Wilson, *The Amateur Democrat* (Chicago: University of Chicago Press, 1966); and Edward N. Costikyan, *Behind Closed Doors* (New York: Harcourt, Brace and World, Inc., 1966). The relationship between the political strength of the mayor and the development of the community action program in all three cities is analyzed in Greenstone and Peterson, "Reformers, Machines . . .," *op. cit.*

²³ The power of the mayor in Chicago politics is well described in Edward Banfield, *Political Influence* (New York: Free Press of Glencoe, 1961).

²⁴ Although the style of politics has changed somewhat since this book was written, the best published introduction to Philadelphia's politics is James Reichley, *The Art of Government* (New York: Fund for the Republic, 1959).

tion in the three cities were associated with variations in the patterns of actual and interest representation. In this section we will first compare the community action programs on these two dimensions along which substantive representation varied and then show the way in which particularistic interest representation led to declining levels of actual representation. Representatives of the poor in Chicago provided almost no actual representation, the representatives in Philadelphia provided moderate amounts of actual representation, and in New York actual representation was considerable. The bases for making these assessments of the influence of the representatives were 1) the extent to which neighborhood councils controlled poverty resources, including the selection of staff, the allocation of funds, and the determination of local programs, and 2) the degree to which the funds allocated were distributed to independent neighborhood groups.

If formal representation was low in Chicago, substantive representation in the city was equally so, for the representatives scarcely had any influence over the operations of the community action program.²⁵ The neighborhood service centers carried on their activities with little or no direction by local neighborhood councils. Although the councils could "review" and "recommend" programs and policies, they had no authority over the operations of the center. They did not even have the authority to participate in the selection of the personnel for the neighborhood programs. It is true that the neighborhood council had the authority to spend a limited amount of money each year (somewhere between \$25,000 and \$50,000), provided that the money was administered by the service center personnel; but in practice the center staff decided the purpose for which these funds were spent, a decision which was then ratified by the neighborhood council. Moreover, as of January, 1966, small sums had been given only to four neighborhood groups in Chicago, amounting to but 2.2 percent of the total community action appropriation.

²⁵ This analysis is based on research in three of Chicago's seven neighborhood service centers, including a white and Puerto Rican community on the North Side, a better organized, more stable Negro community on the South Side, and a disorganized slum providing the first home for southern Negro migrants on the West Side. I wish to thank Isaac Balbus, Marguerite Barnett and Rennie Davis for granting me their permission to use material they have gathered on Chicago's community action program. More supporting evidence for the argument presented here can be found in Peterson, *op. cit.*, Ch. III.

Not only were Philadelphia's representatives elected directly by voters in poverty areas, but they initially had considerably more influence over the community action program than their Chicago counterparts. Nonetheless, throughout the first two years actual representation steadily declined.²⁶ In the beginning, the representatives of the poor had been able to revise substantially a planned parenthood proposal so that it would include services rather than be purely educational.²⁷ But this kind of contribution to policy-making declined rapidly after the first few months of the program. For a small but significant illustration, in the summer of 1965 the newly elected representatives turned down a staff request seeking permission to join a national association of community action agencies formed to lobby Congress and the OEO. In the following summer, however, the representatives of the poor unanimously agreed to join the association; by this time they seldom turned down the staff's recommendations. On the other hand, during the first two years of the program the city poverty council allocated 16 percent of the community action funds to neighborhood and minority groups, which was considerably higher than the comparable figure for Chicago. Moreover, the representatives obtained considerable influence over the hiring of "nonprofessional" employees. They appointed hundreds of employees hired both by public and private agencies operating community action programs and by their own neighborhood service centers. Thus, it was an especially dramatic instance of declining power when in the spring of 1966 the representatives relinquished their authoritative control over the director of the neighborhood service center in exchange for the possibility that they could be hired to work in the service center. The service center, which had been under the formal control of the neighborhood council, came under the direction of the central staff, much as was the case in Chicago.²⁸

²⁶ In addition to observation of citywide developments in Philadelphia, research was conducted in three randomly-selected neighborhood council areas. This research is reported in further detail in *ibid.*, Ch. IV.

²⁷ Arthur B. Shostak, "Containment, Co-option, or Co-determination?" *The American Child*, XLVII (November, 1965), 17.

²⁸ Since the representatives of the poor continued to have some influence over employment of "nonprofessionals," it is an exaggeration to say, as did one close observer of the program, that the "poor were rendered as powerless as ever." Arthur B. Shostak, "Urban Politics and Poverty," Paper presented at the annual meeting of the American Sociological Association, 1966, p. 2 (Mimeo-

graphed.) Yet the fact is that this same observer had earlier reported such a glowing picture of poor people participating in policy-making that the statement clearly discloses the declining representation of the poor in Philadelphia. See the article in footnote 27 for the earlier, optimistic analysis.

Even though representatives were selected by neighborhood organizations rather than directly by the voters, actual representation was nonetheless greater in New York City than in Philadelphia. First of all, more than 46 percent of the community action funds were allocated to neighborhood and minority groups.²⁹ Also, neighborhood councils won increasing influence over the development of the community action program. In two of the three communities studied, the locally selected leadership had the status of independent contractors with the city government and controlled their own funds once the contract had been signed. Even in the other community which did not have this status, the local neighborhood council was successful in maintaining a large measure of local control over the selection of personnel, the determination of local programs, and the expenditure of community action funds.

This variation in the level of actual representation among the three cities was directly correlated with the variation in the level of interest representation. In New York representatives articulated universalistic interests, in Philadelphia they were oriented towards particularistic interests, and in Chicago they lacked influence to provide either positive or negative interest representation. In order to reach these assessments concerning the level of universalistic representation, we examined the extent to which representatives fulfilled OEO expectations that they would use their position to strengthen the political resources of their communities. Data were collected on 1) the extent to which the resources at the disposal of the neighborhood councils were actually used to organize neighborhood residents, and 2) the extent to which representatives, neighborhood councils, and organizations under their supervision articulated demands

²⁹ Because of the need to examine operating programs in a city where the community action program was slow in being implemented, we selected for investigation the first three neighborhoods in which a community action program was operating. Thus, although data on citywide developments were collected, this report draws largely upon developments on the Lower West Side of Manhattan, in the Bedford-Stuyvesant area of Brooklyn, and in East Harlem. New York's community action program is discussed in greater detail in Peterson, *op. cit.*, Ch. V.

aimed at changing the quality of services to the poor.

Since the representatives in Chicago lacked influence, they were unable to provide universalistic interest representation. Instead, the community action program was operated in accord with the policy of the Daley Administration, which felt that political action in black neighborhoods was undesirable. As a leading local official pointed out to a federal observer: "[It] is through the public bureaucracies with their professional staff that mayors must now build their reputations with the poor and minority groups of the city." In accord with this emphasis, neighborhood service centers, which were the primary institutional expression of Chicago's poverty program, co-ordinated a wide variety of governmental services to the poor. The employees of the center were trained to provide personal services rather than to channel group demands; political activists were reprimanded and, in some instances, fired. The neighborhood service centers were efficient, highly bureaucratized institutions whose mission, as stated by personnel throughout the organization's structure, did not include strengthening the neighborhood's political resources. Nor did the representatives themselves make broad political demands for new policies that would improve the life chances of the members of their community. Neither the neighborhood councils nor the neighborhood service center employees encouraged voter registration drives or group efforts directed toward improving education, welfare, or housing facilities.

The representatives in Philadelphia had greater influence on the development of the community action program, but they were, for the most part, oriented towards securing particularistic benefits for themselves and their friends rather than towards promoting broad, universalistic changes in government policy. Thus, the two issues which dominated much of the discussion during the first two years of the program were 1) payment to the neighborhood council representatives for their services, and 2) neighborhood council influence over the hiring of poverty employees in their neighborhoods.

The great majority of neighborhood representatives felt that they should be paid. Monthly stipends for the representatives were proposed, grants to attend an in-house training institute received the backing of university professors, actual employment on the staff of the poverty agency was practiced, and, finally, generous expense allotments for the representatives were decided upon. Although the local poverty agency was receptive to these demands of the representatives of the poor, OEO refused to condone such use of limited poverty funds. Nonetheless,

throughout much of the first year, elected representatives did hold jobs with the poverty agency, and only after a major confrontation between the City and the federal government did such practices diminish.

The representatives' influence over personnel selection was exercised, in many cases, on behalf of close friends and relatives. A minority of representatives objected to this practice in terms such as the following:

"They get mothers, brothers, neighbors, and people they owe favors [for the available jobs]. I had my husband apply, because at least he's qualified."

"The trouble is that a few of them get all the jobs for their friends. I have recommended people, but they don't get jobs. You can't get a job unless you say the chairman recommended you or something."

A more satisfied representative stated that one of the reasons she enjoyed her position was:

"I know what's going on and this way I can help my family and friends."

In sum, much as the machine politician provided for the needs of particular members of the immigrant community, the Philadelphia council members sought particularistic benefits that would improve the life chances of specific members of the low income population.

The focus on particularistic benefits to the exclusion of broader policy questions contributed to the decline in actual representation in Philadelphia. Although the majority of respondents claimed that these centers had attempted some organizational activity, such as the formation of block clubs, identification of block leaders, and holding neighborhood meetings, only a few specific examples of the actual formation of new organizations could be given. Moreover, the representatives themselves rarely sought to make broad changes in the operations of other institutions serving the urban poor. The representatives did appeal to the state legislature in a well-coordinated effort to obtain revision of state welfare laws. But with the exception of one attempt to retard an urban renewal project, the representatives hesitated before criticizing local bureaucracies for fear that this would jeopardize staff support for the particularistic goals they sought. They also sacrificed authority over their neighborhood service centers for the possibility (which never materialized) of employment opportunity.

In New York, on the other hand, the representatives utilized their considerably greater influence to promote universalistic interests. Consistent with the autonomy of neighborhood

councils mentioned earlier, the extent of universalistic interest representation in New York differed considerably from neighborhood to neighborhood. But in all three neighborhoods investigated intensively, staff members were charged by the neighborhood councils with the responsibility of organizing tenant groups, block clubs and other community groups. In Bedford-Stuyvesant community action personnel had begun to generate community pressures in favor of major changes in the operations of the welfare department and the school system. But it was in East Harlem that poverty resources were most obviously used to strengthen the political resources of the community. Although two factions were in competition for control of poverty funds, both factions used the resources at their disposal to organize the local population on behalf of causes which had some promise of improving the life chances of the neighborhood population as a whole. These resources helped to maintain a cadre of community activists who continually demanded changes in welfare, housing and educational policies in the community. Indeed, the political activity in East Harlem generated citywide movements for drastic reorganization of the city's educational system.³⁰ Whatever the merits of the goals of East Harlem leaders, it is clear that representatives of the poor addressed themselves to questions of broad public policy.

Particularistic interest representation, in the sense that representatives sought payment and jobs for themselves and patronage for their friends, was certainly not absent in New York City. But in contrast to Philadelphia these concerns did not become so predominant as to handicap the capacity of the representatives to provide universalistic representation as well. This difference between New York and Philadelphia was due in part to the way in which actual representation, conflict, and interest representation were inter-related.

IV. SUBSTANTIVE REPRESENTATION AND CONFLICT

Higher levels of actual representation generated intra-neighborhood conflict, which in turn encouraged more universalistic interest representation. The greater the level of influence by community representatives over the program, the greater the level of conflict within the com-

munity—particularly in neighborhoods of ethnic and/or racial heterogeneity. As representatives of the poor gained more control over the allocation of poverty program resources, they found more at stake to divide them. But organized and extensive conflict reinforced tendencies towards universalistic interest representation. Competition for power within the community forced the competing leaderships to justify their appeal for community support by representing broad community interests.

The variation among the three cities in actual representation, conflict, and interest representation illustrates the relationship among these three variables. Given the low level of actual representation in Chicago, the major problem for the poverty staff in that city was to stimulate sufficient interest among council members so that a quorum necessary to conduct council business could be achieved. Conflict was sporadic, disorganized, and related to specific issues that occasionally arose. In Philadelphia, where the representatives had some influence over hiring policies, conflict revolved largely around the distribution of employment opportunities to claimants sponsored by different members of neighborhood councils. Conflict was the greatest in the community where racial factionalism was apparent, as black and white councilors opposed each other over the selection of council employees. The animosity was subdued, however, and did not reach the level of public discussion. Although the agreement tended to break down in the heat of the electoral campaign, the two sides had even formed an agreed slate for the second poverty election.

The relative serenity of community action politics in Chicago and Philadelphia contrasted sharply with the community action politics in New York City, where the much greater level of actual representation gave rise to organized and extensive conflicts worthy of more detailed attention. Conflict was organized in all three New York neighborhoods, as two factions competed for control of the neighborhood's community action program. These factions can be characterized as the traditional community leadership faction and the partisan-oriented faction. The traditional community leadership in the field of welfare was vested in settlement houses, YMCAs,³¹ and Catholic, Protestant and Jewish churches and welfare agencies. Even though these groups did not have a common view towards welfare policy, they buried their differences in order to obtain lucrative community action funds. On the Lower West Side of Manhattan memories of conflict between a prominent settlement house

³⁰ A detailed analysis of the attempts by representatives of the poor to change the structure and policies of East Harlem's educational system can be found in Paul E. Peterson, "The Politics of Educational Reform," in Frank Lutz (ed.), *Dynamics in Urban Education* (Columbus, Ohio: Charles Jones, 1970).

³¹ Young Men's Christian Associations.

and the Catholic Church strained relationships but did not prevent surprisingly close co-operation in the development of community action plans. In Bedford-Stuyvesant the community had a paucity of community leadership, for private welfare agencies had deserted the community as the neighborhood became black. Only the YMCA, supported by local Negro clergymen, doctors, lawyers, and other middle class professionals, remained to provide the traditional leadership. In East Harlem a settlement house and a combined church and welfare agency provided basic institutional strength for the traditional community leadership. Despite the diversity of the leadership grouping among these three neighborhoods, they bore in common the burden of being known as "the Establishment," which was the favorite epithet leveled against them by their opposition.

The opposing faction in each of the communities is more difficult to characterize, but inasmuch as they had more overt political ties than the "Establishment" faction, we shall call them the "partisans." We do not mean to imply that the "Establishment" had no political connections, but it is possible to say that these connections were secondary sources of strength, connections which were the result of (rather than the cause of) their basic institutional importance to the community. The "partisans," on the other hand, were more vulnerable to the charge of "playing politics," for their base of support appeared to be more narrowly political. On the Lower West Side the institutional base of support for this faction was the reform club movement, which is the predominant partisan political force in that part of New York City. In Bedford-Stuyvesant the general lack of any stable political force inhibited the development of a stable partisan faction. But the director of the neighborhood service center in the community, a politically astute and capable administrator, sought to develop an alternative, more political base of power in order to free herself from the constraints that the "Establishment" placed upon her. Within two years, the "Establishment," realising the dangerous possibility her attempts to mobilize a power base on a previously apathetic population would have for their own position, removed the director from her job and replaced her with a more traditional social worker. In East Harlem the partisan faction rested primarily on an ethnic base. Since the traditional community leadership came from and serviced the black population in this racially heterogeneous community, the partisans appealed to Puerto Rican pride in order to mobilize support from another wing of the community. Led by an attractive and personable Young

Puerto Rican social worker, they depended on close ties with Democratic leaders in the Robert Wagner Administration and in the United States Senate.

The extensive character of the conflict was evident both in its duration and in the range and significance of the issues. In East Harlem both factions had separate access to poverty funds, and each side attempted to secure control of all resources allocated to the community. On the Lower West Side the debate was over the method by which council representatives should be selected in the future and the kind of programs that should be operated by the neighborhood service center. In Bedford-Stuyvesant the debate was over relations with private welfare agencies and the balance of power between the council and its staff. In all three communities the conflict was detectable at least as early as the summer of 1964, and it continued into the summer of 1966 when this research was completed. During this period the conflict between Negroes and Puerto Ricans in the heterogeneous community of East Harlem became so intense that on more than one occasion physical force was threatened.

Organized and extensive conflict reinforced tendencies towards universalistic interest representation. In Chicago and Philadelphia the relatively amiable relationships among the representatives of the poor hindered community discussion of the representatives' obligations to their constituencies. In New York both factions, constantly competing for community support, sought to establish their credentials as vigorous defenders of the community's interests. Public officials in East Harlem frequently dismissed community agitation against their agency as simply the byproduct of organizational aggrandizement. Their observations, though an oversimplification, cannot be dismissed entirely, for the competition for power kept both organizations searching for means by which they could expand their support. In this way, community conflict functioned to generate the articulation of demands for broad changes in governmental services to the poor.

V. RELATIONSHIPS BETWEEN FORMAL AND SUBSTANTIVE REPRESENTATION

Table 1 sets forth the patterns of representation and conflict we have observed in the community action program in Chicago, Philadelphia and New York. The relationships among actual representation, conflict, and interest representation have already been noted. It remains for us to analyze the relationships between formal and substantive representation. It is apparent from Table 1 that differing arrangements for formal

TABLE 1. FORMAL REPRESENTATION, SUBSTANTIVE REPRESENTATION AND CONFLICT IN CHICAGO, PHILADELPHIA AND NEW YORK CITY

Patterns of Political Action	Cities		
	Chicago	Philadelphia	New York City
1. Formal Representation	Low (Indirect via mayor)	High (Direct elections)	Moderate (Indirect via neighborhood organizations)
2. Substantive Representation			
a. Actual Representation (Influence)	Very low	Moderate and declining	High
b. Interest Representation (Orientation)	—	Particularistic	Universalistic
3. Conflict	Low	Mild	Organized and extensive

representation of the poor are associated with differing patterns of substantive representation. Formal representation of the poor controlled by an elected city official (Chicago) was associated with such a low level of actual representation that the orientations of the representatives were insignificant. Formal representation controlled by neighborhood groups (New York) preceded relatively high levels of neighborhood control and universalistic interest representation. Direct election of the representatives of the poor (Philadelphia) was the precursor of moderate influence and particularistic orientations. Are these relationships causal or spurious? With only three cases to draw upon, a definite answer is obviously impossible. Yet a reasonable interpretation may emerge from analysis of the patterns that were observed.

Serious consideration must first be given to the possibility that the formal arrangements had no significant effect on the influence and orientations of the representatives of the poor. As was pointed out at the beginning of this analysis, the neighborhood groups in New York were the strongest and in Chicago they were the weakest. The settlement over formal representation may be understood simply as an initial statement of the power relations between the city government and the community organizations. It can be argued that the subsequent pattern of substantive representation may be due basically to this underlying power relationship rather than to the arrangements for formal representation, which

merely reflected this power relationship. Such an interpretation is persuasive, for it stresses informal, extra-governmental political relationships rather than the technical arrangements of governmental institutions.

However, it would be incorrect to dismiss the significance of formal governmental arrangements altogether. To do so would, in the first place, ignore the fact that political actors regarded these formal arrangements as critical and were in many cases willing to invest many resources in securing a process of selecting representatives which they could influence.³² Secondly, it is possible to identify a factor which helps to explain the empirical association between formal and substantive representation. The constituency for the representative, as shaped by the arrangements for formal representation, influenced the patterns of substantive representation.

Formal representation in Chicago provided a constituency for representatives of the poor that facilitated a low level of actual representation. The constituency of the representatives, as shaped by the selection process, was a powerful political institution whose interests were hostile to the mobilization of new political energy among low income groups. The constituency was the same center of power towards which demands that necessarily accompany universalistic interest representation must be directed. But the

³² *Supra*, p. 121.

representatives found their position too insecure and their independent base of political power too weak to attack those that appointed them.

The constituency of the representatives of the poor in Philadelphia encouraged substantive representation particularistic in character. The poverty elections were an extreme case of "friends and neighbors" politics. In *Southern Politics* Key informs us that friends and neighbors politics is likely to occur when there is an

absence of stable, well organized . . . factions of like-minded citizens formed to advocate measures of common concern. In its extreme form localism justifies a diagnosis of low voter-interest in public issues and a susceptibility to control by the irrelevant appeal to support the home-town boy. . . .³³

One indicator of the low voter interest in the poverty elections, which was widely broadcast by the news media at the time, was the less than 3 per cent of the eligible population participating in the balloting. Closer analysis of the election data suggests that those few who voted were influenced by localist considerations. Each of the twelve areas in which neighborhood council representatives were chosen was divided into four sections for polling purposes. In order to determine the relationship between the residence of candidates and voting behavior, each candidate was classified according to the polling section in which he lived. A voter was eligible to cast his ballot upon presentation of evidence that he resided within that section. Since votes were tallied by voting section, it was possible to determine localist influences on the voting behavior.

Localism influenced, first of all, the voter's decision as to whether he should vote at all. Among all forty-eight voting sections in the twelve neighborhood council areas, there was a strong correlation between the number of council candidates residing in that section and the number of voters on election day. Table 2 reveals the sharp increase in the number of voters as the number of candidates increased.³⁴ The

data suffer from our inability to state the voter turnout in percentage terms. But for those twelve voting sections (chosen at random) for which we did estimate the percentage turnout,³⁵ the relationship between the number of candi-

since many people did not fully utilize all twelve votes. The best, though far from satisfactory solution, we felt, was to assume that at each of the four polling places within a CAC area the voters used equal amounts of their total voting power. Such an assumption enabled us to formulate the following proportion:

$$\frac{S_v}{S_b} = \frac{A_v}{A_b}$$

where S_v equals the total number of voters in the voting section, S_b equals the total number of ballots cast for all candidates in the voting section, A_v equals the number of voters in the CAC area, and A_b equals the total number of ballots cast for all candidates in the CAC area. Since three of the four quantities were known, we were able to solve for the fourth, giving us an estimate of the number of voters in each voting section.

Where more candidates ran for office in a section, it is possible that voters used more amounts of their voting power in order to vote for several of their friends and neighbors on the ballot. If so, this would mean that our assumption that voters used equal amounts of their voting power in estimating the number of voters biases the findings in the direction of estimating more voters in sections that had more candidates. Some of the high correlation between number of candidates and voter turnout, therefore, may be attributable to the exercise of greater voting power by voters in those sections that had more candidates. Even if this were the case, however, it would in no way be contrary to our basic contention that voting behavior was affected by friends and neighbors politics.

³³The size and characteristics of the total population in the sample areas were estimated from data made available by Richard H. Uhlig of the Philadelphia Health and Welfare Council. Since areas (and sections within areas) did not correspond with census tracts in a number of cases, all calculations based on these data are subject to some error. In addition, our estimate of the population was based on all people eighteen years and older reported in the 1960 census data. Since voting was limited to those twenty-one years and older, our figures underestimate the percentage of those eligible that voted. However, unless the age distribution for the three years eighteen to twenty-one varies substantially from one neighborhood to another, it is unlikely that this affects inter-area comparisons.

³³ V. O. Key, *Southern Politics* (New York: Alfred Knopf, 1950), p. 37.

³⁴ While records were kept on the number of voters for each CAC area as a whole, the number of voters for each voting section within the areas could not be obtained directly. Although the number of votes cast for each candidate within each voting section was available, the sum of these votes could not be accepted as a direct measure of the number of voters because each person was permitted to vote for as many as twelve candidates. Neither was the solution to divide the total number of votes cast in an election by twelve,

TABLE 2. NUMBER OF CANDIDATES LIVING IN SECTION AND VOTER TURNOUT IN FORTY-EIGHT VOTING SECTIONS

Number of candidates living in section	Number voting in section
0-3 (9)	60.9
4-6 (14)	252.2
7-9 (13)	316.5
10-12 (12)	433.1

dates and voter turnout was even more dramatic. The rank order of the two variables for these twelve sections was nearly identical, and the product-moment coefficient of correlation attained a value of .86. The details are in Table 3. In an election having such a low turnout, people did not vote unless there was some particularly compelling reason for them to go. In this case the most powerful force inducing voters to participate was a friend or neighbor running for office; the more candidates in an area, the more people would do a friend a favor by showing up at the polls.

The pattern of support for each candidate within his neighborhood council area revealed that a voter tended to vote for candidates that lived within the same voting section that the voter did. An index of localism was developed in order to state the degree to which localist influences were revealed by the voting behavior. The rationale for this index is stated in the Appendix. In brief, the index of localism states numerically the proportion of votes received by a local candidate as compared to the average proportion received by all non-local candidates,

TABLE 3. NUMBER OF CANDIDATES LIVING IN VOTING SECTION AND VOTER TURNOUT IN TWELVE SAMPLE SECTIONS

Number of candidates living in section	Per cent voting in section
1	5.6%
12	5.7
10	2.2
8	1.4

TABLE 4. PROPORTION OF NON-WHITES IN COMMUNITY ACTION COUNCIL AREA AND AREA'S SCORE ON INDEX OF LOCALISM

Percent non-white in community action council area	Index of localism score
0%-15% ^a (2) (Predominantly White)	2.03
25%-45% ^a (6) (Racially Mixed)	2.00
65%-90% (4) (Predominantly Negro)	2.03

^a No CAC areas had 16 to 24, or 46 to 64 percent nonwhite populations.

holding constant the general popularity of each candidate. If the local candidate did proportionately no better than non-local candidates, the value of the index is 1.00. If his proportion is less than that of non-local candidates, the value is less than 1.00.

As measured by this index, localism pervaded Philadelphia's poverty election. Out of 348 candidates 93 percent ran proportionately better in their home section than did the average non-local candidate.³⁶ Only 6 percent did not do as well, while two candidates ran proportionately as well as did the average non-local candidates. The index of localism for the average candidate was 2.07. Thus, the average candidate did proportionately twice as well in his own section as did the average non-local candidate in that section. This pattern of voting behavior appears not to have been due simply to racial loyalties which would appear as localist influences because of segregated housing patterns. If such had been the case, one would have found a lower index of localism in those neighborhood council areas which consisted largely of one racial group. But, as can be seen in Table 4, the racial complexion of an area had little effect on the index of localism.

The tendency for the voter to favor the neighborhood candidate, together with the strong correlation between the number of candidates living in a section and voter turnout, suggests that personal acquaintance with one or more of the candidates crucially affected both the decisions to vote and for whom to vote. Indeed, friends and neighbors politics, in this context, takes on a literal meaning that could not have been quite the case in the southern states that Key analyzed. The neighborhood council areas were so small that non-local candidates often lived only

³⁶ Two candidates were excluded from the analysis, because it was impossible to ascertain in which voting section they lived.

a few blocks away. Finding localism in the voting within these supposedly compact council areas reveals an extreme instance of friends and neighbors politics. This friends and neighbors style of politics indicated the lack of issues disputed by organized competing factions, which usually stimulate citizens to vote. During the six weeks before the election no significant issues and no citywide organizations contesting the elections emerged. The Congress of Racial Equality and the National Association for the Advancement of Coloured People, realizing their own weaknesses, decided to let "the poor people choose their own representatives." The party organizations accepted the decision of community action program officials that party activists were not eligible to participate in this election. Such neighborhood slates as were formed were little more than hastily arranged agreements for temporary gain rather than a coalition of interests with a discernible perspective concerning the proper approach to ameliorating the plight of low income citizens.

Certain structural characteristics of poverty elections encouraged this issueless, friends and neighbors political style. The elections were held separately from other elections. They were electoral contests between politically unknown individuals for an obscure and relatively unimportant post with almost totally undefined responsibilities. The announcement that such an election would be held was made only six weeks prior to election day, an inordinately short period for the selection of candidates, the organization of campaigns and the development of issues.

The constituency formed by the arrangements for formal representation contributed to the representative's particularistic orientation. To the extent that the newly elected representatives had any constituency at all, it consisted of those few personal acquaintances who had been mobilized by the candidate to support him on election day. Since the representatives lacked a strong, organized constituency upon which they could depend for future political support, they sought to develop a small, personally loyal following by distributing particularistic benefits. The bureaucratic staff and the Tate Administration won the acquiescence of the representatives on larger policy questions by encouraging their interest in questions of patronage and financial remuneration. Friends and neighbors politics in Philadelphia, as in the South, extended the power of the dominant political force in the community, the City Administration. It is not surprising that in subsequent years, the City fought for continued election of the representatives of the poor—even after OEO had lost enthusiasm for this innovation.

The constituency for New York's representatives, as shaped by the processes of formal representation, encouraged substantive representation of a universalistic interest character, because the representative's constituency was organized through neighborhood groups. Since the concerns of the organizations in the community did not, for the most part, depart radically from the interests of the population, their very organization helped them to become effective links binding representatives to their constituents. Representatives thus spoke for and were accountable to an organized constituency which could be relied upon in moments of crisis. Whatever disagreements existed among community leaders, they drew together to protect the local community action program from the city's intervention. Representatives sought to protect the autonomy of their local organizations rather than simply to secure particularistic benefits for themselves. Although examples of combined community efforts to ensure autonomous local influence over the poverty program occurred in all three (and many other) neighborhoods, we shall illustrate the pattern by briefly describing events in Bedford-Stuyvesant.

The community action program in that community had been developed by a staff responsive to the interests of "the Establishment," but as prospects for funding by OEO improved, a new, more politically oriented director took the helm. The Wagner Administration, noticing the growing split within the Bedford-Stuyvesant community, seized this opportunity to bring the program under more central direction. The community responded to this threat with unexpectedly unified political action. Community meetings were held, telegrams and phone calls were sent to Congressmen (and even to the Vice-President), and a vigorous defense of the decentralized arrangements was made in personal discussions with city officials. Representatives from the community on the city poverty council were able to use their position to protect local control of the community action program. In the face of this opposition, city officials retreated from their attempt to centralize authority. It was the availability of the resources of an organized community that enabled New York's representatives of the poor to win the local control which was essential for the universalistic interest representation peculiar to that city.

This relationship between formal and substantive representation may be peculiarly characteristic of representatives of disadvantaged groups in society. The formal process by which corporations, labor unions, and professional associations are selected as representatives on official policy-making bodies probably has little effect on

their subsequent behavior. Analyses of group influence in policy-making throughout the federal system in the United States suggest that such groups are capable of providing quite effective interest representation under a variety of formal and informal relationships with policy-makers.³⁷ The multiplicity of access points—both formal and informal—available to higher status groups reduces the significance of any one channel of influence. If a particular representative does not provide effective interest representation, the high status group may be crippled temporarily in its relations with the government, but sooner or later it will find a more effective channel or representation. To guard against loss of position within their own group, representatives thus tend to be vigorous exponents of the group's interests.

Among low status groups the number of alternative channels through which the group can influence public policy is likely to be significantly less. Thus, the importance of any one channel of representation is thereby enhanced. The representative's bargaining position *vis a vis* the agency he is trying to influence is minimized and his bargaining position *vis a vis* the group he is representing is strengthened. Other factors being equal, he is more likely to make greater concessions merely to maintain his position as formal representative. Consequently, the formal selection process has particular significance for the substantive behavior of representatives of the poor.

VI. SOCIALLY DESCRIPTIVE REPRESENTATION

Socially descriptive representation was far less controversial in these three cities than were the arrangements for formal representation. Neighborhood groups were far less insistent that any income limit be placed upon those chosen to represent the residents of low income communities. Their reticence on this point may have been due to the tendency for organizations to recruit the more skilled, better educated, and more affluent members of the community; many of their leaders would be disqualified from participating if a strict income limit were placed on those who could serve as representatives of the poor. The extent to which socially descriptive representation was implemented must be attributed to OEO's dogged insistence that at least some of those representing the poor come from similar backgrounds themselves. In New York and Chicago no more than one-third of the representatives on the

neighborhood councils and an even smaller percentage on the citywide councils had incomes within the poverty zone.³⁸ In Philadelphia, on the other hand, election regulations required that *all* members of neighborhood councils have incomes of less than \$6000 annually (the limit for any individual council member varying with the size of his family).³⁹ Forty percent of the city poverty council consisted of representatives who also conformed to these income restrictions. Moreover, Negroes were also well represented among the elected council members. Although nonwhites (mostly Negroes) comprised only 44 percent of the population in designated poverty areas, 70 to 80 percent of the one hundred and forty-four elected representatives were nonwhite.⁴⁰

This difference between Philadelphia and the other two cities enables us to inquire as well into the effect that socially descriptive representation had on the patterns of actual and interest representation. In general, it seemed that lower income representatives were more interested in securing particularistic benefits, whereas more middle income representatives were interested in achieving both influence and universalistic changes in government services to the poor. As we noted earlier, Philadelphia's representatives focused on payment for themselves and positions in the agency for their family and friends as major goals which they wished to pursue. Similarly, on New York's Lower West Side, the partisan factions, who agitated for greater involvement of the poor, were repeatedly disappointed by the support which low income representatives gave to their opponents in exchange for particularistic

³⁸ Both the level of income which was the upper limit of the poverty zone and the percentage of poor on neighborhood and citywide councils fluctuated over time. In general Chicago's social representation increased somewhat from a very low level, whereas New York's decreased in 1966. More detailed information can be found in Peterson, "City Politics and Community Action," pp. 56-59, 133-153.

³⁹ There is some evidence that enforcement of this rule was not excessively rigid, but it was nevertheless apparent that the overwhelming majority of council members had incomes below the upper limit and the remainder were in only slightly better economic circumstances.

⁴⁰ In three randomly selected areas, the distribution was 72 percent Negro, 25 percent white and 3 percent Spanish-speaking. A close observer of the program estimated that in the city as a whole about 80 percent of elected representatives were nonwhite. Shostak, "Urban Politics and Poverty," p. 1.

³⁷ See, for example, Grant McConnell, *Private Power and American Democracy* (New York: Alfred Knopf, 1966), *passim*.

benefits.⁴¹ Thus, the particularistic character of interest representation in Philadelphia might not have been so pronounced had income restrictions on candidates been less severe. Certainly, the middle class organization leaders in New York in many cases were more concerned about strengthening their power and influence in the program than in gaining material benefits for themselves or their friends. Thus, whereas the Philadelphia representatives were slowly losing influence in the hope of securing material benefits, this trend was not apparent in New York City. In fact the victory of the Bedford-Stuyvesant community in its conflict with the mayor must be attributed in part to the skills and positions of influence which the middle class leaders of the neighborhood organization had at their disposal.

But it is too facile an explanation to say that Philadelphia and New York community action programs took different directions because lower income representatives seek material gain whereas middle income representatives sought influence for their organizations. Such an interpretation ignores the extent to which political power relations and the arrangements for formal representation strengthened the representatives of the poor in New York. Lower income representations in East Harlem and Bedford-Stuyvesant fought for greater neighborhood influence over the program with a vigor unknown in Philadelphia. It was the coincidence of disorganized politics *together with* restrictions on the income of representatives in the latter city that explains their particularistic interest representation.

This tendency of socially descriptive representatives to provide particularistic rather than universalistic representation may well be peculiar to representatives of disadvantaged groups in society. Lower status representatives, on the other hand, are more likely to have personal financial difficulties which can be eased by trading power and influence for monetary assistance. The greater dependence of his constituency upon him as a representative enables the representative to strike such a bargain with the agency he is trying to influence without losing his status

vis-à-vis his constituency. Moreover, perhaps because of the realities of power relations, this pattern of behavior does not depart from the norms of lower class culture. The machine politician was respected for his power, even though it was well known he used his power for personal gain. Since political power was one of the few avenues for social mobility, the culture condoned such a political style. The Philadelphia representatives provided but another illustration of this pattern of behavior.

VII. SUMMARY

The following hypotheses are supported by the data in this comparative case study:

1. Representation of universalistic interests of low status groups is associated with the occurrence of:

a) an organized relationship between the formal representatives and the low status group, provided that this organizational link is not controlled by interests antithetical to those of the low status group;

b) political competition and conflict among those seeking to be the formal representatives of the low status group;

c) formal representatives who are related to the low status group in an organized manner, but who are not socially descriptive of the low status group with respect to such status variables as occupation, education and income; and

d) substantial influence by formal representatives over the operations of the relevant governmental program.

2. Representation of particularistic interests of low status groups is associated with the occurrence of:

a) little organized competition for the position of formal representative together with selection of representatives more for their personal qualities than for their position on political issues;

b) few, if any, organizational mechanisms systematically linking formal representatives to their constituencies as a whole;

c) ample opportunities for the distribution to constituents of divisible, material benefits by the formal representatives;

d) moderate influence over the operations of the relevant governmental program by formal representatives; and

e) formal representatives who are socially descriptive of the low status group with respect to status variables.

3. Representation of scarcely any substantive interests—either particularistic or universalistic—of low status groups is associated with the occurrence of:

⁴¹Community action program officials in Oakland also eliminated middle class neighborhood leadership seeking to provide universalistic interest representation by requiring that representatives be socially descriptive of their constituency (i.e. having annual incomes of less than \$3000). Nicholas Masters *et al.*, *Politics, Poverty and Education: An Analysis of Decision-making Structures*, Report submitted to the Office of Economic Opportunity, Washington, February, 1968, p. 253.

a) a relationship between the formal representatives and the low status group which is organized by an interest contrary to those of the low status group; if this factor is present, other variables are unlikely to affect significantly the character of substantive representation.

APPENDIX¹

Any measure of friends and neighbors politics or localism must be based on votes cast for various candidates in various constituencies, which in this case were called sections. These data may be arranged in a matrix whose rows correspond to candidates and whose columns correspond to sections. Thus we define as an entry in the data matrix

v_{ij} = The number of votes cast for candidate i in section j .

Then, let

S_i = the sum of the votes cast for candidate i in all sections.

T_j = the total of the votes cast for all candidates in section j .

V = the sum of all votes cast for all candidates in all sections.

From this an index of over-representation R_{ij} for candidate i in section j can be calculated.² R_{ij} simply states the ratio of the actual proportion of candidate i 's total vote that he received in section j to his expected proportion, or:

$$R_{ij} = \frac{v_{ij} \text{ (actual)}}{v_{ij} \text{ (expected)}}. \quad (1)$$

The expected proportion is the proportion candidate i would have received in section j had his vote been distributed in equal proportions among all sections, or:

$$v_{ij} \text{ (expected)} = \frac{S_i T_j}{V} \quad (2)$$

Substituting the right-hand of equation (2) for v_{ij} (expected) in equation (1) and dropping the no longer necessary designation "actual" from the numerator in equation (1) yields:

¹ Duncan MacRae provided considerable assistance in the development of the index of localism.

² The index of over-representation has been used widely by political scientists and sociologists. See, for example, Donald R. Matthews, *U.S. Senators and Their World* (Chapel Hill, North Carolina: University of North Carolina Press, 1960), pp. 273-74.

$$R_{ij} = \frac{v_{ij}}{\frac{S_i T_j}{V}}. \quad (3)$$

which equals

$$R_{ij} = \frac{v_{ij} V}{S_i T_j}. \quad (4)$$

For purposes of measuring localism this index suffers from the overlap between the data upon which both the "expected" and actual proportions are derived. T_j is the column summation of all cases of v_{ij} , including the instance of v_{ij} which is the basis for determining the actual proportion of candidate's i 's total vote that he received in section j . As a result, the index of over-representation tended to measure not only localism but also the concentration of candidates among sections, a variable which conceptually has nothing to do with localism. This difficulty is eliminated by dividing the index of over-representation for local candidate l by the index of over-representation for non-local candidate m . This yields an index of localism L_l for local candidate l :

$$L_l = \frac{R_{lj}}{R_{mj}}. \quad (5)$$

Substituting from (4),

$$L_l = \frac{v_{lj} V / S_l T_j}{v_{mj} V / S_m T_j}, \quad (6)$$

which reduces to:

$$L_l = \frac{v_{lj} / S_l}{v_{mj} / S_m}. \quad (7)$$

In order to reduce the effect of random error, an average of all values v_m / S_m may be an improvement on the denominator of (7). Thus:

$$L_l = \frac{v_{lj} / S_l}{av(v_{mj} / S_m)}. \quad (8)$$

Thus, the index of localism as stated in (8) is simply the proportion of a local candidate's total vote that he receives in his own district divided by the average of the corresponding proportions for all non-local candidates. Note that this formula includes no T_j term, which frees the index from distortions resulting from an overlap between v_{ij} and T_j . However, the S_i term (visible in (8) as S_l and S_m) was not eliminated from the formula upon which the index of localism was based. Consequently, variations in the size of the vote among sections has affected the index to some extent. It is extremely unlikely, however, that any resulting imprecisions in the measurement of local influences in the Philadelphia elections were so great as to affect the substantive argument of the paper.

THE POLITICS OF REDISTRIBUTION*

BRIAN R. FRY

Stanford University

AND

RICHARD F. WINTERS

Dartmouth College

A comparatively new line of research in political science involves the systematic investigation of political, social, and economic factors important in the formation of public policy. So far, such research has yielded temptingly persuasive evidence that political variables exert little or no independent influence on policy outcomes; that policy outcomes are governed overwhelmingly by socio-economic factors. Stated more succinctly, these findings have raised the question: Does politics make a difference in the policy formation process?¹

We suggest in the following analysis that these prior findings have been the result of the examination of a measure of public policy in which the influence of the political system is likely to be negligible, that is *levels* of public revenues and expenditures. To examine this proposition empirically, our study shifts attention to the allocation of the burdens and benefits of state revenue and expenditure policies across income classes. In redirecting analysis to allocations rather than levels of state revenues and expenditures, we focus on a province we believe to be more predictably political.²

We have taken as our dependent variable the

* Some of the data used in this analysis were taken from information made available by Thomas R. Dye. Computation time was provided by Stanford Computation Center, Stanford University. Machine and secretarial assistance were provided by the Hoover Institution on War, Revolution and Peace, Stanford University, as well as by the Institute of Political Studies, Stanford University. Our thanks also go to Raymond E. Wolfinger, Heinz Eulau, Hubert Marshall, and William Paisley for their encouragement and criticism.

¹ This question is obviously a gross oversimplification of the problem. See Charles S. Cnudde and Donald J. McCrone, "Party Competition and Welfare Policies in the American States," this REVIEW, LXIII (September 1969), 858-866.

² Easton, of course, has defined politics as "the authoritative allocation of values." See David Easton, *A Systems Analysis of Political Life* (New York: John Wiley), p. 21.

net redistributive impact of revenues and expenditures as represented by the ratio of expenditure benefits to revenue burdens for the three lowest income classes in each state.³ The major hypothesis of our study is that, in regard to the allocation of the burdens and benefits of state government revenues and expenditures, political variables will have a stronger influence on policy outcomes than will socio-economic variables.

I. LITERATURE REVIEW

The literature of the systematic analysis of public policy was launched with the publication in 1952 of Solomon Fabricant's *The Trend of Government Activity in the United States since 1900*.⁴ As part of his analysis, Fabricant used a multiple regression statistical model to examine interstate variations in levels of per capita state and local expenditure in the United States in 1942. He found that more than 70% of the variance in these levels could be explained by the impact of differences in per capita income, urbanization, and population density. Both Fabricant's focus and his method have inspired subsequent research.

For example, a number of studies published in the *National Tax Journal* have elaborated on Fabricant's initial findings within the basic framework of the multiple regression approach and with continued reliance on socio-economic independent variables. These efforts were directed mainly at extending Fabricant's analysis over time and breaking down the dependent variable to determine the differential impact of his three independent variables on various components of expenditures. What the studies indicated was, briefly, that the explanatory power of

³ This measure is a direct statistical analogue of Lasswell's and Kaplan's indulgence-deprivation ratio. See Harold Lasswell and Abraham Kaplan, *Power and Society* (New Haven: Yale University Press, 1950), p. 61.

⁴ Solomon Fabricant, *The Trend of Government Activity in the United States Since 1900* (New York: National Bureau of Economic Research, 1952), ch. 6.

the independent variables has decreased since 1942, accounting for little more than half the variance in levels of state expenditures in 1957,⁵ and for only 18% of the *changes* in levels of state expenditures between 1957 and 1960.⁶ Further, these studies demonstrated that the effect of this set of independent variables varies with different facets of expenditures, having its least influence on welfare expenditures in the states.⁷ Probably the most impressive overall finding of these studies, however, is the consistently high explanatory power of the socio-economic variables employed relative to absolute levels of expenditures.

In 1963, Dawson and Robinson, through the explicit introduction of political variables, initiated an exploration of the political dimension of public policy outcomes.⁸ Drawing their inspiration from a V. O. Key hypothesis,⁹ they examined the relationship between interparty competition and welfare policies as evidenced by an amalgam of state tax and expenditure measures which they labeled "welfare orientation." They found that interparty competition is indeed fairly closely related to welfare orientation in the states, but this relationship disappears when controls for per capita income are introduced.

Subsequent research into the impact of political variables has tended to confirm Dawson's and Robinson's initial findings. For instance, Hofferbert followed Dawson's and Robinson's lead, but refined the definition of welfare orientation and added divided party control, malapportionment, and regional controls (South vs. non-South) to interparty competition as independent variables.¹⁰ He reported low zero-order correlations¹¹ for divided party control and malappor-

tionment, and no independent impact for any of the political variables considered.

Thomas Dye reported a veritable catalog of results in his book *Politics, Economics, and the Public: Policy Outcomes in the American States*.¹² He employed the multiple regression model to analyze the relationship between certain socio-economic variables (urbanization, industrialization, income, and education) and political variables (division of party control, interparty competition, voter participation, and malapportionment) on the one hand, and a wide variety of expenditure and tax measures on the other. Dye's findings were generally consistent with those of his predecessors: for forty-seven of fifty-four tax and expenditure measures, socio-economic variables had more influence on policy outcomes than did political variables. As Dye states:

... correlation analysis reveals that these [political] system characteristics have relatively little *independent* effect on policy outcomes in the states. Economic development shapes both the political systems and political outcomes, and most of the association that occurs between system characteristics and policy outcomes can be attributed to the influence of economic development. Differences in the policy choices of states with different types of political systems turn out to be largely a product of different socio-economic levels rather than a direct product of political variables.¹³

But a few more positive results have appeared in the literature. Lineberry and Fowler shifted

correlation coefficient is the simple, bivariate correlation coefficient. It is a *summary* measure of association. A *partial correlation coefficient* is a measure of association or the strength of a relationship between two variables—e.g., urbanization and redistribution—controlled for a third or more variables. Thus, it is a measure of the unique portion of the association after the common portion has been controlled. The *multiple-partial coefficient* is a summary measure of the "explanatory" power of a group of variables. It states the unique portion of the variance attributed to one set of variables—e.g., political variables—after another variable or set of variables—e.g., economic variables—has been controlled. The *coefficient of determination* associated with any of the three above measures is the square of the coefficient of correlation (simple or multiple) which is equal to the portion of variance explained by the measures.

the level of analysis to American cities to determine the impact of reformism (reformed cities are defined as those having city manager government with nonpartisan and at-large elections) on tax and expenditure policy.¹⁴ The authors ran separate multiple regression analyses in reformed and unreformed cities and found that socio-economic variables accounted for less of the variance in tax and expenditure levels in reformed cities. They saw the difference as an effect of reformism. Unfortunately, however, their methodology did not permit an assessment of the relative impact of political and socio-economic variables on policy outcomes. Grumm developed a new independent variable, an index of legislative professionalism, which he found to have an independent relationship with public welfare expenditures.¹⁵ Sharkansky and Hofferbert factor analyzed a number of variables and discovered that the "political" factor positively correlated with welfare-education policies after controlling for their socio-economic factor.¹⁶

Two authors have followed a different approach, alterations in the dependent variable, in arriving at their more positive results concerning political variables. Sharkansky proposed that a distinction be drawn between public policy (expenditures and other indicators of official concern) and policy outputs (the results of those policies).¹⁷ He examined the relative impact of environmental variables and policy variables on high school attendance and completion (output measures). Sharkansky found policy measures more closely related than environmental variables to levels of attendance and rate of graduation, though that relationship was reversed in regard to dropouts. Walker, on the other hand, devised a non-monetary measure of public policy: his innovation index measures the extent and rapidity of adoption of eighty-eight

policies among the states.¹⁸ Walker found that, although each of a number of political variables (party competition, party turnover, legislative apportionment, and legislative professionalism) correlated fairly closely with innovation, the relationship disappeared when socio-economic controls were introduced for all but the malapportionment-innovation correlation (a finding of no mean significance in itself).

This brief literature review highlights a number of findings relevant to the present analysis. First, socio-economic variables have relatively high explanatory value in terms of policy as it is measured by levels of taxes and expenditures in the states. Second, where political variables have been examined in relation to tax and expenditure levels their effect has usually been overshadowed by that of socio-economic variables, and often have shown no independent impact whatsoever. Third, the relationship between socio-economic variables and fiscal policies varies according to the specific components of these policies, and the relationship is particularly weak in reference to welfare policies.

The first two findings suggest that the political analyst may have to look beyond levels of taxes and expenditures to find politics having an independent or dominant influence on policy outcomes in the states. The third finding indicates that, as Key originally hypothesized, a fruitful area of search for such influence may be the redistributive policies of state governments.

Accordingly, as stated earlier, this analysis takes as its dependent variable the net redistributive impact of state revenues and expenditures. The political relevance of this variable has been suggested by Jacob and Lipsky in a review of research on public policies:

The distribution of benefits or sanctions is perhaps the most significant output dimension for political scientists, since much of the conflict preceding adoption of a program is not about whether it should be embarked upon but who will pay and who will benefit. Even programs that apparently benefit most of the population—such as education and highway construction—have a variable incidence of benefits.¹⁹

Implicit in this statement and in our analysis is a conception of politics as a bargaining pro-

cess in which trade-offs are made at the margins in deciding among alternative policies. The product of this process is embodied in the final configuration of penalties and rewards, which we are measuring in terms of the net redistributive impact of state revenues and expenditures. In sum, though one would expect that environmental conditions would largely determine at what level revenues and expenditures will be set, politics is likely to be pivotal in establishing the allocations of rewards and benefits at that level.²⁰

Our purposes in this study are twofold: (1) to develop a statistical model that has a fairly high degree of explanatory power in regard to the redistributive policies of American states, and (2) to examine the relative importance of political and socio-economic variables within that model. We shall use multiple regression analysis as an instrument for accomplishing those purposes.

II. DEPENDENT VARIABLE

The obvious first requirement of this analysis is to devise a satisfactory measure of the net redistributive impact of revenues and expenditures. We use as a basis for this derivation the Tax Foundation study, *Tax Burdens and Benefits of Government Expenditure by Income Class, 1961 and 1965*.²¹ This study, as the title implies, distributes revenue burdens and expenditure benefits across income classes. To do this, Foundation researchers selected a number of allocation bases which appeared to describe the incidence of revenue burdens and expenditure benefits by income class and applied these bases to revenue and expenditure totals. For instance, elementary and secondary education expenditure benefits were assumed to be distributed according to the number of children under 18 in families in each income class, so that if 20% of children under 18 were in families with an income of \$4,000 to \$4,999, 20% of expenditures on elementary and secondary education were assigned as benefits to that income class. Similarly on the revenue side, if 20% of total expenditures on al-

coholic beverages were made by families with an income of \$6,000 to \$7,499, it is assumed that 20% of the alcoholic beverage tax was paid by families in that income class. This process, with an appropriate allocation base for each revenue and expenditure category, was repeated for all federal government revenues and expenditures and for aggregate category totals of state and local government revenues and expenditures. Expenditure totals by level of government were taken from Department of Commerce, Office of Business Economics reports, and the allocation bases from Department of Labor data.

For our study we have calculated by revenue and expenditure category the percentage distributions of state revenue burdens and expenditure benefits from the Tax Foundation study. However, since Office of Business Economics expenditure and revenue figures, which are the basis for the Tax Foundation study, are not available on a state-by-state basis, we have used Census Bureau expenditure and revenue state totals as the base to which allocation factors are applied.²²

Our analysis is restricted to revenues and expenditures for state governments only, rather than a combination of state and local totals, for several reasons. First, it would appear that the state-local combination is more a statistical construct than a coherent governmental jurisdiction. As Sharkansky puts it:

... the fusion of state and local government activities confuses the efforts of politically-distinct units. The state-plus-local aggregate is artificial, and not the arena in which policy-makers decide about the size of their budgets or the allocation of funds.²³

Second, the state level has traditionally been a level at which redistribution has been sought both in an attempt to overcome regional dif-

²⁰ Dawson and Robinson attempted to get at the concept of redistribution in the article already cited, but their perspectives were restricted by the measure of welfare orientation they chose and a concentration on levels of taxes and expenditures. See Dawson and Robinson, *op. cit.* We propose a considerably more comprehensive measure addressed specifically to allocations of benefits and burdens.

²¹ Tax Foundation, Inc., *Tax Burdens and Benefits of Government Expenditure by Income Classes, 1961 and 1965* (New York: Tax Foundation, Inc., 1967).

²² This shift raises a procedural problem, since the Census Bureau and the Office of Business Economics define revenue and expenditure categories somewhat differently. To counter this difficulty, we have either grouped the Census Bureau figures into categories at least nominally equivalent to those set up by the Office of Business Economics or we have used allocation bases which appear to be appropriate to the Census Bureau categories. A number of technical differences prevent a direct comparison between the categories so derived and the Office of Business Economics data, but comparability is not a major consideration, since it is only necessary to assume that the allocation bases are appropriate for the revised categorization of the Census Bureau figures.

²³ Sharkansky, *op. cit.*, p. 4.

ferences in tax bases and expenditure policies and in the name of equity. Third, previous research has indicated that state and local levels are analytically distinct, responding in different ways to different influences.²⁴ Fourth, and in a more practical vein, there is a potential ecological problem in analyzing state-wide political, social, and economic indicators in relation to local output measures. Were local outputs to be included in the analysis, the prudent but difficult course to follow would be to collect data on the independent variables at the local level. The theoretical case for the state-local separation is not clear-cut, but we feel that the above considerations are sufficiently persuasive to justify that separation in this analysis.

A number of additional factors should be noted in our development of the dependent variable. First, we have included intergovernmental revenues and expenditures in state revenue and

²⁴ *Ibid.*

expenditure totals. This inclusion was made on the assumption that political and socio-economic conditions within a given state are related to both the level and nature of intergovernmental revenues and expenditures in that state. We have distributed intergovernmental expenditure benefits across income classes according to the distribution of each category of intergovernmental expenditures. We have distributed intergovernmental revenues in proportion to the distribution of the burden of all federal revenues. Second, we have treated unemployment compensation as a state program.²⁵ Finally, though the

²⁵ This classification is somewhat ambiguous since the federal government levies a tax on employers but allows a credit for state taxes up to 90% of the amount of the federal tax. Since most states have adopted a tax to take advantage of the credit, and in accordance with the Tax Foundation classification, we have considered unemployment compensation to be a state program.

TABLE 1. STATE GOVERNMENT EXPENDITURES (1961)

Category	Amount (millions)	Basis for Allocation
Direct Expenditures	\$24,578	
Education	3,792	
Elementary & Secondary	226	Number of Children under 18
Higher and Other	3,566	Higher Education Expenditures of Families
Highways	6,230	Half Auto Operation Expenditure and Half Total Current Consumption
Public Welfare	2,311	Income from Public Social Assistance and Private Relief
Agriculture ¹	435	Farm Money Income Before Taxes
Liquor Store	873	Alcoholic Beverage Expenditures
Insurance Trust ²	4,701	Public Unemployment & Soc. Security Benefits
Interest ³	584	Interest Income
Other—General	5,652	Half Family Money Income Before Taxes & Half Number of Families and Unrelated Individuals
Intergovernmental	10,114	
Education	5,963	Combined Allocation for all Education Expenditures
Highways	1,266	Same as Direct Highway Expenditures
Welfare	1,602	Same as Direct Welfare Expenditures
General	1,283	Same as Direct General Expenditures
Total Expenditures	\$34,693	

¹ Prorated share of nonseparable intergovernmental expenditures deducted.

² Unemployment compensation classified as a state program.

³ Interest paid.

Tax Foundation analyzed revenues and expenditures for 1965, we have used their revised data for 1961 because both their allocation bases and the information used in our independent variables are based on figures for the earlier period. Expenditure and revenue totals, and the allocation bases for each revenue and expenditure category, are shown in Tables 1 and 2. Tables 3 and 4 display the percentage distribution of revenue burdens and expenditure benefits by income class for each type of revenue and expenditure.

Given the revenue and expenditure totals and the allocation factors, the remaining steps in the calculation of the dependent variable are relatively simple:

- 1) Apply the allocation factors to the amounts collected and the amounts spent in

each revenue and expenditure category in each state. This computation yields the amounts paid in revenue and received in benefits by income class for each category of revenues and expenditures in each state.

- 2) Sum the benefits received and revenues paid for each income class. The sums are the total revenue burden and expenditure benefit for each income class in each state.
- 3) Calculate the ratio of expenditure benefits received to revenues paid for each income class in each state.

The summary measure of the net redistributive impact of revenues and expenditures in each state is simply the ratio derived in step 3 for the lowest three income classes in each state. This gives us a directional measure of redistrib-

bution (assuming, as is the case, that the ratios are higher in the lowest three income classes than in the remaining income classes), with higher summed ratios indicating more redistribution to the lowest income groups. Since it is commonly believed that the lowest income groups are denied access to the decision-making chambers of government, the limitation of our analysis to redistribution to the three lowest income groups poses a rigorous test for hypotheses involving political variables. The ratios for the lowest three income classes in each state are shown in Table 5.

There are a number of problems in this explanation of the net redistributive impact of revenues and expenditures which should be kept in mind in interpreting the results of this study. First, the Tax Foundation analysis was not done

for each state, but only for aggregate state and local revenues and expenditures, with nationwide allocation bases. In applying these allocation bases to state-by-state revenue and expenditure totals we have necessarily assumed that the allocation base distributions are constant in all the states. Thus, for instance, in apportioning the burden of the cigarette tax, we assume that cigarette expenditures in each state are distributed across income classes in the same manner as in the nation as a whole. This is clearly an unrealistic assumption, but one necessitated by restrictions on available data. To the extent that these distributions diverge among the states, of course, the data will be in error. Second, in the interest of simplification, the Tax Foundation study embodies a number of assumptions about the incidence of revenue burdens and expendi-

ture benefits in allocating burdens and benefits to income classes. Perhaps the most controversial are the assumptions concerning the incidence of the corporation income tax and general expenditures. In recognition of this problem, the Tax Foundation has offered alternatives in both of these areas. In the present study, in deference to arguments among economists concerning the incidence of the corporation income tax, we have adopted the alternative which assumes that half the corporate taxes and fees are borne by stockholders and half are shifted to the consumer. We have also followed a middle course concerning general expenditures, assuming that half of these benefits are distributed in proportion to family money income before taxes and half in proportion to the number of families and unrelated individuals in each income class. The relevant question, in terms of this analysis, is whether or not these assumptions accord with the perceptions of fiscal policy-makers. We feel that our assumptions do no great violence to those perceptions, but this, of course, is a matter for empirical investigation. Third, some of the allocation bases employed in the Tax Foundation study would appear to be more applicable to federal revenues and expenditures than to those of the states, particularly in regard to income taxes (allocated according to the federal income tax burden) and insurance trust revenues and

expenditures (both allocated in part according to the distribution of the burdens and benefits of social security taxes and expenditures). The practical effect of the choice of these allocation bases is probably to reduce our level of measurement from an interval to an ordinal scale. Here we assume that the *order* of the relative redistributive impact of the revenue and expenditure categories is preserved despite the fact that the relative *degree* of redistribution is probably distorted. For instance, we assume that state income taxes have a higher redistributive impact than most other state revenue sources although the relative degree of redistribution is probably overstated because of the Tax Foundation assumption that the distribution of the burden of state income taxes is the same as that of the federal income tax. Finally, in our consideration of only revenues and expenditures, the deficit of the states has been ignored; therefore revenue burdens are understated. To the extent that this omission has an equal impact in all the states, there will be no distortion in the regression analysis.

III. INDEPENDENT VARIABLES

Consonant with our first objective, developing a model with relatively high explanatory power, we have embarked on a frankly exploratory expedition in choosing independent variables. Hofferbert provided the general structure for this exploration when he suggested that independent variables be drawn from several dimensions: historic-geographic conditions, socio-economic composition, mass political behavior, governmental institutions, and elite behavior.²⁶ We have attempted to draw variables from all of these dimensions save that of historic-geographic conditions, though our classification is admittedly arbitrary.

The socio-economic variables used in this analysis are median family income,²⁷ industrialization,²⁸ urbanization,²⁹ education,³⁰ percent-

¹ Alaska and Hawaii have been excluded from the analysis because data for some of the independent variables were not available for the time period considered.

² The ratio of expenditure benefits to tax burdens for the three lowest income classes.

tage of families with less than \$3,000 annual income,³¹ and the Gini index of income inequality.³² The first four variables—income, industrialization, urbanization, and education—were chosen because of the high explanatory power they have exhibited in previous studies as correlates of levels of revenues and expenditures. We hypothesize that as a state develops economically and more completely fulfills basic service functions, a larger portion of its resources becomes available for other functions which tend to be more redistributive in character. The use of these variables also allows a direct comparison between the results of this and previous studies. The percentage of the population with income under \$3,000 and the Gini index were both added on the assumption that the greater the inequality of income in a state and/or the larger the proportion of low income families in that state, the greater the perceived need for redistribution through state revenue and expenditure policies.

Political participation,³³ Democratic vote,³⁴

partment of Commerce, Bureau of the Census, *U.S. Statistical Abstract, 1968* (Washington, D.C.: U.S. Government Printing Office, 1968), p. 367.

³⁰ Education is defined as the median school year completed by persons 25 years of age; drawn from *U.S. Census of the Population, 1960*, p. 1-248.

³¹ *U.S. Statistical Abstract, 1968*, p. 286.

³² The Gini index is a summary measure of the inequality of income in a given population. It is derived from a Lorenz curve on which the percentage of total income is arrayed along the y-axis and percentage of consumer units is arrayed along the x-axis. A line drawn at a 45-degree angle across the graph describes perfect equality, since a given percentage of the consumer units will claim an equal percentage of total income at points on this line (e.g., the lowest 10 percent of the consumer units have 10 percent of total income). The Gini index describes, roughly, the area between the 45-degree line and the line representing the actual distribution of income. The larger the area—the higher the Gini index—the more unequal the distribution of income in the population. The Gini index used in this study is from David Verway, "A Ranking of States by Inequality Using Census and Tax Data," *Review of Economics and Statistics*, XLVIII (1966), 314.

³³ The participation index is defined as the votes cast for the state's Governor as a percent of voting age population. See U.S. Department of Commerce, Bureau of the Census, *U.S. Statistical Abstract, 1963* (Washington, D.C.: U.S. Government Printing Office, 1963), p. 367.

³⁴ Measured in terms of average Democratic vote

interparty competition,³⁵ and legislative inducements to participation³⁶ are used as indicators of mass political behavior. First, we hypothesize that the participatory aspect of the political system will have a positive impact on state redistributive policies. Both overall measures of political participation and legislative inducements to participate are related to this hypothesis. Our decision to consider political participation, as measured by the average rate of voter participation in gubernatorial races between 1954 and 1962, was prompted by the well-established proposition that lower income groups are less likely to vote than higher income groups.³⁷ Thus we assume that the higher the voter participation, the more likely it is that voters in the lower income groups have participated in the election. With more electoral participation by the lower income groups, we further assume there will be increased pressure for measures favorable to those groups. Our use of the Milbrath index of legislative inducements to vote was based on much the same rationale. On the premise that legal barriers to participation have a differentially greater effect on lower income groups, we assume that removal of these barriers—or positive encouragement to vote—will have its greatest impact on the lowest income groups.

We are also concerned with the partisan component of mass political behavior: interparty competition and Democratic vote are employed to measure this dimension. The inclusion in our analysis of the Hofferbert index of interparty competition follows a hypothesis posed by V. O. Key in *Southern Politics*—that interparty competition promotes the distribution of benefits to lower income groups.³⁸ Key asserted that in-

for Governor as in *U.S. Statistical Abstract, 1968*, p. 367.

³⁵ The measure of interparty competition is a rank order measure integrating the state's competition in the presidential, senatorial and gubernatorial races. For more detail on the measure, see Richard I. Hofferbert, "Classification of American State Party Systems," *Journal of Politics*, XXVI (1964), 550-567.

³⁶ The legislative inducements to participation index is a summed measure noting the extent to which each state has legal measures facilitating participation, e.g., absence of literacy tests and residency requirements, permanent registration, etc. See Lester Milbrath, "Political Participation in the States," in Herbert Jacob and Kenneth Vines (eds.), *Politics in the American States* (Boston: Little, Brown, 1965), p. 46.

³⁷ Robert Lane, *Political Life* (New York: Free Press, 1959), p. 49.

³⁸ Key, *op. cit.*, pp. 298-311.

terparty competition leads to the organization and subsequent representation of lower income groups as the "outs" replace the "ins" and policies favorable to the new groups result. With the introduction of Democratic vote, we have taken the analysis of party behavior a step further. Here we attempted to probe the programmatic content of partisan behavior. We assume that the Democratic party propounds programs more favorable to lower income groups than does the Republican party. Hence we hypothesize, the greater the electoral support for the Democratic party in a given state, the more directionally redistributive will be the revenue and expenditure policies of that state. Democratic vote is measured by the average percentage of votes received by Democrats in gubernatorial elections between 1954 and 1964.

We have selected four variables to represent Hofferbert's next dimension, governmental institutions: legislative apportionment,³⁹ legislative party cohesion,⁴⁰ gubernatorial powers and gubernatorial tenure.⁴¹ Malapportionment has been a subject of considerable interest and analysis, and despite generally negative findings, the suspicion lingers that it has an important political impact. This suspicion is based on persuasive theoretical arguments which, in terms of redistribution, can be summed up rather simply: since malapportionment usually reflects underrepresentation of urban areas, and since the strongest demand for redistributive policies is likely to emanate from these urban areas, it is assumed that the degree of malapportionment will vary inversely with the extent of redistribution in a state.

Governor's tenure and power were included in

³⁹ Glendon Schubert and Charles Press, "Measuring Malapportionment," this REVIEW, LVIII (December 1964), pp. 969-70.

⁴⁰ The measures of party cohesion and interest-group strength were derived from a questionnaire "sent to two or more competent persons in each state, including political scientists . . . , director of . . . research, agencies or bureaus, legislative officers and politicians. At least one reply was received from each of the 48 states—in most cases two or three." See Belle Zeller, *American State Legislatures* (New York: Thomas Crowell, 1954), pp. 190-192.

⁴¹ The measure of gubernatorial tenure is an index combining the gubernatorial length of term and the legal possibilities for re-election. The gubernatorial power index combines evaluative indices of budget powers, appointive powers, and veto powers. See Joseph Schlesinger, "The Politics of the Executive," in Jacob and Vines, *op. cit.*, pp. 220, 222, 226-27, 229.

the analysis on the basis of two assumptions. First, we assume that governors are likely to press for redistributive measures in response to the varied pressures of the broad-based constituency required for their election. Second, we assume length of time in office, re-election possibilities, and structural sources of power will provide the governor with the tools necessary for the accomplishment of his purposes. Legislative party cohesion is used on much the same rationale. Here we assume that the accommodation of the varied interests necessary to produce party cohesion will lead to the enactment of redistributive measures.

The final dimension suggested by Hofferbert is elite behavior. The variables we have chosen to represent aspects of elite behavior are interest-group strength,⁴² percentage of state employees under civil service coverage,⁴³ Grumm's index of legislative professionalism,⁴⁴ and Walker's innovation index.⁴⁵ In regard to interest-group strength, we hypothesize that redistribution to the lowest income groups is *negatively* related to the strength of interest-groups in a state. This hypothesis is based on Schattschneider's contention that a society with many interest groups incorporates a bias against the lower income groups, which typically are not represented in the interest-group system.⁴⁶ We would expect that the stronger the interest-group system, the lower the probability of success for political strategies based on the mobilization of the lower income classes. The inclusion of the percentage of employees covered by the civil service system can be justified in two ways. The more conventional explanation, expounded by such authors as Herring and Key, is that as civil service ap-

⁴³ Council of State Governments, *Book of the States, 1962-63* (Chicago: Council of State Governments, 1962), pp. 178-81.

⁴⁴ Grumm, *op. cit.*, p. 25. The index combined four important qualities of legislative life: (a) compensation of legislators, (b) total length of sessions in 1963-64, (c) expenditures for legislative services and operations, (d) a "legislative services" score.

⁴⁵ Walker, *op. cit.*, pp. 882-883. The innovation index measures the rapidity and extent of adoption within the states of eighty-eight different programs. Such programs ranged from "the establishment of highway departments and the enactment of civil rights bills to the creation of state councils on the performing arts and the passage of sexual psychopath laws."

⁴⁶ E. E. Schattschneider, *The Semi-Sovereign People* (New York: Holt, Rinehart and Winston, 1960), pp. 30-33.

pointments replace political appointments, state services (in this case measured by revenue and expenditure policies) replace patronage as an inducement or a reward for party loyalty.⁴⁷ The allocation of these rewards or inducements is here assumed to be redistributive in character in response to the broad-based coalitions which form political parties. An alternative formulation links civil service coverage with the indexes of legislative professionalism and innovation as measures of what may be termed the "progressive" character of the state political system. Fenton contends that as civil service coverage expands in state offices, "job-oriented" employees are succeeded by "issue-oriented" employees who perceive rewards more in terms of service than in terms of employment security, and that redistribution results.⁴⁸ The high incidence of professionalism in the legislature and policy innovation in the states can be taken as indicators of the same type of emphasis on "equitable, efficient, issue-oriented politics" that is associated with the progressive tradition in American politics.

IV. HYPOTHESES

Our basic hypothesis in this study, as indicated earlier, is that political variables are more closely related to the net redistributive impact of state revenues and expenditures than are socio-economic variables. However, in our attempts to develop an explanatory model of redistribution in the states, we have suggested a number of subsidiary hypotheses which can be tested in this analysis. These subsidiary hypotheses are listed below.

I. Socio-Economic Variables

- A. Redistributive policies of the states vary directly with the level of economic development in the state.
 1. Redistribution varies directly with median family income in the states.
 2. Redistribution varies directly with the degree of industrialization in the states.
 3. Redistribution varies directly with the degree of urbanization in the states.
 4. Redistribution varies directly with the level of education in the states.

⁴⁷ See for example Pendleton Herring, *The Politics of Democracy* (New York: W. W. Norton, 1940), p. 362; and V. O. Key, *Politics, Parties and Pressure Groups* (5th ed.; New York: Thomas Crowell, 1964), pp. 696, 698.

⁴⁸ John Fenton, *People and Parties in Politics* (Glenview, Ill.: Scott, Foresman, 1966), pp. 46-49, 50-78.

- B. Redistributive policies of the states vary directly with the perceived need for such policies in the states.

1. Redistribution varies directly with the degree of income inequality in the states.
2. Redistribution varies directly with the proportion of families with less than \$3,000 annual income.

II. Mass Political Behavior Variables

- A. Redistributive policies of the states vary directly with the extent of participation of lower income classes in the electoral process.
 1. Redistribution varies directly with the overall rate of political participation.
 2. Redistribution varies directly with legislative inducements to political participation.
- B. Redistributive policies of the states vary directly with the nature of partisan activities in the states.
 1. Redistribution varies directly with interparty competition in the states.
 2. Redistribution varies directly with the extent of the support for the Democratic party in the states.

III. Governmental Institution Variables

- A. Redistributive policies of the states vary directly with the quality of apportionment in the states.
- B. Redistribution varies directly with the degree of the governor's power in the states.
- C. Redistribution varies directly with the extent of the governor's tenure in the states.
- D. Redistribution varies directly with legislative party cohesion in the states.

IV. Elite Behavior Variables

- A. Redistributive policies of the states vary inversely with the degree of interest-group strength in the states.
- B. Redistribution varies directly with the extent of the coverage of the civil service system in the states.
- C. Redistribution varies directly with the degree of legislative professionalism in the states.
- D. Redistribution varies directly with the degree of innovative tendencies in the states.

V. FINDINGS

To test the hypotheses, we have run separate multiple regression analyses in 48 states and for non-Southern states.⁴⁹ We will examine the

⁴⁹ For the purposes of this paper, the following

overall coefficients of multiple correlation and determination as indicators of the explanatory power of our model, zero-order and partial coefficients of correlation to test the relationship between each independent variable and redistribution in the states, and multiple-partial coefficients of determination to assess the relative importance of political and socio-economic variables in determining interstate variations in redistributive fiscal policies. Our statistical findings are summarized in Table 6.

As Table 6 indicates, we have achieved a measure of success in our efforts to develop a fairly powerful explanatory model. For all 48 states, the multiple coefficient of determination (R^2) is .55, indicating that the model "explains" 55% of the variance in interstate redistributive fiscal policies.⁵⁰ When separate regression analyses are run for the socio-economic and political variables included in this analysis, we find that socio-economic variables alone account for 17% of the variance in redistribution in the 48 states, and that political variables account for 38% of that variance.

The importance of the regional distinction (South separated from non-South) is indicated by the multiple coefficient of determination derived from a separate regression analysis performed for non-Southern states. For these states, the multiple coefficient of determination for all independent variables increases to .67, with both socio-economic variables ($R^2 = .28$) and political variables ($R^2 = .46$) accounting for more variance than in the 48 states as a whole.⁵¹

states were considered to be in the "South": Alabama, Arkansas, Florida, Georgia, Kentucky, Louisiana, Mississippi, North Carolina, South Carolina, Tennessee, Texas, and Virginia.

⁵⁰ We have not used tests of statistical significance in this analysis, since all 48 states have been included.

⁵¹ Analysis of the impact of political variables in the 12-state area of the South is proscribed by limitations on the degrees of freedom. However, regression analysis of the lesser number of socio-economic variables permits some speculation about the South-non-South differences: the multiple coefficient of determination for the socio-economic variables in the South is .74, higher than for either the 48 states as a whole or for the non-Southern states. Thus, in this analysis we have a situation in which the socio-economic variables account for more of the variance in each region examined than in the 48 states as a whole. Though a precise investigation of this anomaly is not possible within the statistical confines of the present study, we presume that the 48-state analysis contains a number of sup-

The subsidiary hypotheses generated with the introduction of the independent variables in the analysis will receive only perfunctory attention since they are of secondary importance in this study. Table 6 provides a listing of zero-order and partial coefficients of correlation for each independent variable with redistribution for both the 48 states and the non-Southern states. In general the independent variables selected bear the hypothesized relationships to redistribution in both the 48 states and the non-Southern states.

In terms of zero-order correlations in the 48 states, all relationships are as hypothesized with the exception of education, Democratic vote, interparty competition, the Gini index of income inequality, and the proportion of families with less than \$3,000 in annual income. As one would expect, Democratic vote is redeemed when Southern states are excluded from the analysis, with a positive correlation between Democratic vote and redistribution for non-Southern states. The same reversal occurs for the Gini index of income inequality.

Shifting our attention to partial coefficients of correlation, a measure of independent impact of each independent variable on redistribution, we find somewhat longer lists of contrary correlations. For the 48 states, the partials for median income, industrialization, interparty competition, proportion of families with less than \$3,000 annual income, and legislative party cohesion are

pressed relationships which become statistically apparent only in the regional breakdown. The fragmentary data available to us support this presumption. An examination of the zero-order correlations between the socio-economic variables and redistribution in the South reveals that median income, industrialization, urbanization, and education have a strong *negative* relationship with redistribution. On the other hand, both the Gini index and the percentage of families with less than \$3,000 in annual income have a strong positive relationship with redistribution. In short, redistribution varies inversely with what appear to be measures of ability to pay and directly with perceived need for redistribution. Since we would expect federal aid to vary in the same manner, with assistance provided to those states most in need and least able to pay, we assume that South-non-South differences in redistribution can be accounted for largely by differences in the impact of federal aid, and that this differential impact produces relationships obscured in the 48-state data. This conclusion can only be considered tentative and in need of more direct substantiation, but it suggests a fruitful area for future research.

all related to redistribution in a direction opposite to that hypothesized. For non-Southern states, all of the same reverse relationships persist and the index of governor's power is added.

Two of these variables—interparty competition, and proportion of families with less than

\$3,000 annual income—are related to redistribution in a direction opposite to that hypothesized for both zero-order *and* partial coefficients of correlation and regardless of regional breakdown. For these two variables, then, the statistical evidence is most convincing for rejecting the asser-

tion that they are correlated as hypothesized with the degree of redistribution in the states. For interparty competition, our data lead us to reject the venerable Key hypothesis that an increased level of interparty competition will increase the level of redistribution in the states. The negative relationship between the proportion of families with less than \$3,000 annual income and the extent of redistribution should be evaluated in light of the positive relationships between redistribution and both legislative inducements to participate and the overall rate of participation. If we are correct in assuming that the latter two measures indicate the extent of electoral participation by lower income groups, we can tentatively conclude that, as might be expected, redistribution to the lowest income classes is more a function of participation by these classes than of their size.

The most interesting and significant finding in this study, however, concerns the relative importance of political and socio-economic variables in determining redistributive fiscal policies in the states. As indicated in the introductory section, previous studies of policy outcomes in the states have been hard pressed to find an independent impact for the political variables considered, and where the relative impact of political and socio-economic variables has been examined the socio-economic variables have predominated. In the present analysis, these findings are reversed. Not only do the political variables have an independent impact on redistributive policies in the states; they also account for considerably more of the variance in redistribution than do socio-economic variables. The relative explanatory power of the political and socio-economic variables is indicated by the multiple-partial coefficients of determination displayed in Table 6. For the 48 states the multiple-partial for political variables controlled for the socio-economic variables is .46 while the multiple-partial for the socio-economic variables controlled for the political variables is only .27. For the non-Southern states, the results are similar. The multiple-partial for political variables controlled for economic variables in the non-South is .54 while the multiple-partial for the socio-economic variables controlled for political variables is only .39. In other words, in the 48 states and in the non-Southern states, the political variables included in our analysis are considerably more powerful than the socio-economic variables in explaining variance in state redistributive policies.

Two objections which can be raised about the above interpretation of the multiple-partial coefficients of determination are: (A) the finding

may be an artifact of the number of political variables used in the analysis (12) relative to the number of socio-economic variables employed (6); and (B) there may be variables not yet considered which could alter the observed relative impact of the political and socio-economic variables. The first objection is susceptible to a direct statistical confrontation. Taking only the five most powerful political variables (measured in terms of sums of square-reduction) versus the five most powerful socio-economic variables, the multiple-partial for the political variables controlled for the socio-economic variables is .42, while the multiple-partial for the socio-economic variables controlled for the political variables is .20 for the 48 states. Making the same comparison in the non-Southern states, we find the multiple-partial for political variables controlled for socio-economic variables is .47, while the multiple-partial for socio-economic variables controlled for political variables is .34. Thus, our finding concerning the relative impact of political and socio-economic variables is not simply the product of the number of each type of variable incorporated in this study. The second objection, the possibility that a variable not considered in this analysis could alter the observed relationships, cannot be answered definitively. We have attempted to minimize this possibility by developing a model with a high degree of explanatory power. Our findings, of course, are only tentative and subject to modification by future research.

VI. CONCLUSION

The foregoing analysis has been specifically addressed to an investigation of the determinants of variations in the net redistributive impact of revenues and expenditures in American states. In a broader sense, however, this study has been concerned with the more general question of whether or not the political system exercises an independent impact on public policy outcomes, and with the specification of an arena in which such an impact is likely to be found.

Previous analyses of policy outcomes have generally indicated that socio-economic variables have a dominant influence on those outcomes, with few reported instances of political variables exerting an independent impact. We have contended that these results have been the product of a continuing concentration on policy outcomes as measured by levels of taxes and expenditures. Accordingly, we have shifted the focus of our analysis to an examination of allocations of burdens and benefits in state systems of revenues and expenditures.

Our statistical results indicate that the shift

in focus has been fruitful. First, we have been able to develop a statistical model that accounts for more than half the variance in redistribution among the 48 states included in the analysis and more than two-thirds of the variance in non-Southern states. Second, and more significantly, we have found that the political variables employed in the model are considerably more powerful than the socio-economic variables in explaining interstate variations in redistributive patterns. Thus, our data not only support the assertion that politics makes a difference, they suggest that politics plays a dominant role in the allocation of the burdens and benefits of public policies.

It is obvious that this study represents only a preliminary exploration of the theoretical utility

of the concept of the net redistributive impact of revenues and expenditures as a dependent variable. The summary measure of redistribution employed in this analysis (the ratio of expenditure benefits to revenue burdens for the lowest three income groups) is only one of many possible measures with a variety of political implications. The complex interrelationships among the independent variables used in this analysis are susceptible to more systematic treatment. Longitudinal analysis could avoid the dangers inherent in the present research design of drawing dynamic inferences from a cross-sectional model of analysis. Our effort is meant to be but a first step in an intensive analysis of a dependent variable whose value we feel has been demonstrated.

THE SALIENCE OF AMERICAN STATE POLITICS*

AND

HARMON ZEIGLER

University of Oregon

Research emphasizing the correlates of state policy outputs and the performance of particular institutions has overshadowed the role of the citizenry in the drama of state politics. One question of basic concern is the relevance of state government and politics for the inhabitants of a state. At the level of public policy and institutional performance the answer to this is factual and straightforward. The nature, amount, distribution, and to some extent the quality of a state's services and policies can be specified. Since states perform most of the traditional functions of governmental units and since these functions affect the fortunes of the citizens, state politics has an obvious, tangible, objective relevance for a state's inhabitants.¹ At another

level, however, the answer is not so clear-cut. Here we are dealing with the idea of what is subjectively relevant. Large numbers of people apparently pass their lives being touched by political institutions in a variety of ways without becoming particularly interested in or involved with these institutions. Other people become intensely, purposively related to these same institutions. Still others fall along a continuum between these two poles. If substantial variations exist in the general salience of politics, there is little reason to doubt that the same conditions may be found in particular subsets of political matters. In the case at hand this subset consists of the cluster of institutions, actors, and processes known as state political systems.

* This is a revised version of a paper originally presented at the 1968 annual meeting of the American Political Science Association, Washington, D.C. The direct and indirect financial support of The Danforth Foundation and the National Science Foundation is gratefully acknowledged. We also wish to thank Bruce Campbell and Paul Beck for their assistance at various stages.

¹ The literature on the correlates of state policy outputs is becoming voluminous. Thomas Dye's *Politics, Economics, and the Public: Policy Outcomes in the American States* (Chicago: Rand McNally, 1966) perhaps represents the zenith of this approach. Other questions are also receiving attention, however. See, for example, some essays in Herbert Jacob and Kenneth Vines (eds.), *Politics in the American States* (Boston: Little Brown, 1965); Samuel C. Patterson, "The Political Cultures of the American States," *Journal of Politics*, 30 (February, 1968), 187-209; Norman C. Thomas, "The Electorate and State Constitutional Reform: An Analysis of Four Michigan Referenda," *Midwest Journal of Political Science*, 12 (February, 1968), 115-129; and Wayne Francis, *Legislative Issues in the Fifty States: A Comparative Analysis* (Chicago: Rand McNally, 1967). Herbert Jacob and Michael Lipsky provide a sound and enlightened discussion of the field in their "Outputs, Structures, and Power: An Assessment of Changes in the Study of State and Local Politics," *Journal of Politics*, 30 (May, 1968), 510-538.

I. THE CONCEPT OF SALIENCE MAPS

It may be assumed that for every individual at a given point in time some aspects of politics are more salient than are others. These varying degrees of salience result in cognitive maps yielding surfaces with divergent contours and topographies. Analytically, at least two kinds of mapping operations can be visualized. One is laid out according to issue domains. For some people civil rights issues are most salient, for others tax and fiscal issues, for still others questions of foreign affairs predominate, while education may be the prominent part for yet another cluster of people. Some individuals may place equal stress—ranging from high to low—on a host of disparate issues, but given the opportunity costs involved it seems likely that at any point in time the mapping operations result in an ordering of issue salience.

More germane for present purposes is a salience map arranged according to geopolitical units. A variety of investigations have suggested that people do, in fact, develop such maps.² Per-

² For an example and references to the literature see M. Kent Jennings, "Pre-Adult Orientations to Multiple Systems of Government," *Midwest Journal of Political Science*, 11 (August, 1967), 291-317. An historical perspective with a different focus is found in Samuel P. Hays, "Political Parties and the Community-Society Continuum," in William Nisbet Chambers and Walter Dean Burnham

haps the most noted shorthand expression of this differentiation is the local-cosmopolitan dimension. Important ramifications for political systems stem from differentiated salience maps. One has only to think of the stresses and strains in the emergent countries or the separatist enclaves in established polities to grasp these possibilities. The difficulties encountered by national governments as a partial consequence of sub-national loyalties are impressive. Proclivities toward independence in the Canadian province of Quebec, the Nigeria-Biafra confrontation, the uneasy federalism of India, and the failure of the American South to be incorporated fully into the mainstream of American politics testify to the magnitude of these difficulties.

As with salience maps oriented around issues, the maps dealing with levels of government could in fact attach equal relevance to the component parts. That is, a person could be equally interested (or uninterested) in international, national, state, and local public affairs and politics. Yet this would seem to be an inefficient mode of operation if nothing else, and as we shall see momentarily it is a deviant pattern.

Upon what basis would a person distinguish among these four levels of politics? Assuming that he had equal information about all of them, or at least access to equal information, two dimensions can be suggested. First, he may arrange them according to his interest in the policy outcomes involved. Whereas some find local outcomes about services and amenities of greatest subjective relevance, others are more intrigued by the results of military encounters and diplomatic skirmishes at the international level. A second dimension rests not so much with outcomes as with the demands and conversion processes at work within a given system. Here the interest comes from watching how the game is played rather than in what the final scores are. Charismatic political leaders, factional fights, and broader societal cleavages are kinds of forces which can lead to differential salience along this dimension. Attention to outcomes and conversions may operate simultaneously and feed upon each other. Interest generated by a strong, personable governor might be combined with concern over a state tax program to produce a heightened salience for state politics. Should such convergences occur, the two types of salience maps begin to merge. That is, the overlay of the issue salience map on the system salience map begins to produce a single topography. Although the question of overlap between issue

and system maps is an important one, our major concern is with the system map arrangement.

II. THE PLACE OF THE STATES VERSUS OTHER LEVELS

For a variety of reasons one could predict that the states generate but a modicum of interest amongst their residents. Many of these reasons are either explicit or implicit in a statement by Dahl, made in the context of a discussion about optimum units for popular democratic government:

Yet in the perspective I am suggesting the states do not stand out as important institutions of democratic self-government. They are too big to allow for much in the way of civic participation—think of California and New York, each about as large in population as Canada or Yugoslavia and each larger than 80 percent of the countries of the world. Yet an American state is infinitely less important to citizens of that state than any democratic nation-state to its citizens. Consequently the average American is bound to be much less concerned about the affairs of his state than of his city or country. Too remote to stimulate much participation by their citizens, and too big to make extensive participation possible anyway, these units intermediate between city and nation are probably destined for a kind of limbo of quasi-democracy. . . . It cannot even be said that the states, on the whole, can tap any strong sentiments of loyalty or likemindedness among their citizens.³

In a sense the states are caught between the immediacy of the local system and the glamour and importance of the national and international systems. Without wishing to become embroiled in the question of the appropriate units for a democratic polity, we can nevertheless introduce some material which will clarify the location of the states in the salience maps of Americans.

Our data are drawn primarily from the University of Michigan Survey Research Center's 1966 election study, which utilized a national probability sample of the adult population. In order to obtain the interest accorded various levels of politics a series of questions was put to the respondents, beginning with an initial question designed to filter out those people (17 percent) who barely attend to matters of the body politic.⁴ The remainder rank-ordered which

³ Robert A. Dahl, "The City in the Future of Democracy," this REVIEW, 61 (December, 1967), p. 968.

⁴ This question ran: "Some people seem to follow what's going on in government and public affairs most of the time, whether there's an election going on or not. Others aren't that interested.

TABLE 1. RANK ORDER DISTRIBUTIONS FOR SALIENCE OF GOVERNMENTAL AFFAIRS AT FOUR LEVELS

Level of Governmental Affairs	Rank of How Closely Followed				Total ^a	N
	First	Second	Third	Fourth		
International	20%	16%	22%	42%	100	983
National	32	31	26	10	99	983
State	17	33	27	22	99	983
Local	30	20	25	25	100	983
	99%	100%	100%	99%		
	N = 983	983	983	983		

^a Total percentages do not equal 100% due to rounding. Cases involving tied ranks or missing data have been deleted in this table. Their inclusion in any rows or columns would have a maximum effect of but 1 percent on any cell value. The total number of cases for analysis will be 1,008.

kinds of public affairs they follow most closely—international, national, state, and local.⁵

One immediate result of the ranking operations is that it reveals the readiness of Americans to distinguish among the four levels. All but 6 percent of the sample (excluding the inattentive) gave complete orderings. The ease with which the rankings were obtained as well as the meager proportions declining to give complete orderings indicates that people at least believe they have salience maps characterized by a rugged terrain rather than a smooth plain.

It is apparent that, while some respondents place state affairs above all other levels, the majority share of first rank attention is devoted to national and local affairs, such as Dahl predicted (Table 1). If one wants to consider international affairs a mental extension of America's role in world affairs (which some respondents undoubtedly did), then state affairs is even more clearly in last place. Taking only the leading rankings demonstrates that the attentive public for state politics is not particularly large.

The danger in closing the argument on the basis of first ranks is nicely demonstrated in two

ways. Looking at fourth ranks, for example, reveals that state affairs has next to the lowest proportions in this category. More compelling evidence is provided by moving to the second ranks. State affairs has strong second-place strength, being in fact the level selected most often at that rank. The contrast with the fate of international affairs is the most striking, since it too (compared with national and local affairs) had abundant opportunity to pick up second place strength. The result of combining first and second ranks finds one-half of the sample placing state matters either first or second, thereby moving it to an equal footing with local affairs, well ahead of international affairs, but still to the rear of national affairs. While the states may not be uppermost in the political thoughts of their residents, they do occupy a secure niche.⁶

What are the risks in using the respondents' rank orderings of interest in the four levels of politics as a way of deriving their interest in state politics alone? Three immediate justifications for the measure can be offered. First, it should be reemphasized that these orderings reflect those of the national sample *minus* an apolitical stratum, the 17% who avowed they paid no attention to public affairs and politics. Thus we have eliminated at least a substantial proportion of those people who might have contributed idiosyncratic, error-prone estimates of the differential salience of various levels of politics. Second, these kinds of rank-orders have been

Would you say that you follow what's going on in government and public affairs most of the time, some of the time, only now and then, or hardly at all?" Those selecting one of the first three alternatives are considered to be members of the attentive public.

⁵ After handing the respondent a card showing the four levels of public affairs, he was asked to rank them in this fashion: "Which one of these kinds of public affairs do you follow most closely?" "Which one do you follow most closely?" "Which one do you follow least closely?" With first, second, and fourth ranks thus determined the residual level automatically occupied the third rank.

⁶ It should be recognized that we are not merely playing with numbers in order to make a case for the saliency of state politics. There is no logical necessity, given the nature of the questions used, that state affairs attract any second rankings. All respondents after making their first choice could have ranked state affairs third or even last had they been so inclined.

TABLE 2. RELATIVE VERSUS ABSOLUTE LEVELS OF INTEREST IN STATE POLITICS^a

Rank of How Closely State Politics Followed	Attention Paid to State Politics			Row Totals	Marginal Totals	N
	Great Deal	Some	Not Much			
First	58%	39%	04%	101%	15%	(166)
Second	44	50	06	100	38	(407)
Third	27	55	18	100	28	(307)
Fourth	22	56	22	100	19	(204)
Marginal Totals	37	51	12		100%	(1084)

^a Data are drawn from the Survey Research Center's 1968 national election study.

subjected to a spatial scaling technique which indicates the prominence of at least one major dimension running through the rank orders, *viz.*, that of the geo-political domain encompassed by given governmental levels.⁷ Essentially, this means that the ranking of state politics nestles reasonably well within an overall, multi-level salience framework.

A third argument is perhaps the most persuasive. It could be charged that the *relative* salience of state politics bears but little correspondence to its *absolute* salience. Illustratively, a politically passive person ranking state politics first might actually pay less attention to it than a political activist ranking it third or fourth. While the plentiful presence of such inconsistencies could be overlooked on the grounds that one is primarily interested in the workings of individual preference orders regardless of intensities, our concept of salience maps will acquire an extra dimension if it can be shown that this is not the common pattern. The 1966 election study did not ascertain absolute levels of interest in politics at multiple levels, but the 1968 election study did this as well as obtaining the rank orderings of interest.⁸ A moderately satisfying result would take the form of little association between relative and absolute salience. This would

at least allow for the play of relative salience across a spectrum of people having about the same absolute interest in state politics. A much more gratifying result, of course, would be a clear positive relationship between the two dimensions.

The cross-tabulation of the two measures (Table 2) is unequivocal in demonstrating a moderate correspondence between absolute and relative salience, in terms of self-reports. We can say with some confidence that, on the average, those who attend relatively more often to state affairs also tend to pay more absolute attention. By the same token (if the table is percentaged vertically) it is clear that the attentive public in absolute terms comes disproportionately from the ranks of those for whom the state is relatively more salient. There is little reason to suspect that different results would have been obtained from the 1966 respondents, had they been asked the additional questions. One indirect piece of evidence, for example, is that the marginals for the rank-ordered interest in state politics are remarkably similar across the two samples.⁹

⁹ Since we have both relative and absolute measures for the 1968 sample, it might be asked why we do not utilize that sample rather than the earlier one. The reasons are two-fold: 1) in order to capture a "purer" reflection of the salience of American state politics it seems desirable to base the analysis on data gathered during a period relatively uncontaminated by the forces of a national election, for much the same reasons that studies of state voting turnout, division of the vote, and party strength often separate the off-year from presidential year statistics; 2) a number of questions of direct relevance for state politics were asked in the 1966 study, but not in 1968. On the other hand, subsequent work in this general area might well utilize both absolute and relative measures of salience in order to arrange people in a multi-dimensional mode.

⁷ See Jennings, *op. cit.*, for an application of the Coombsian unfolding technique to data of this type from a national adolescent sample. Separate analysis with the sample at hand yields similar results.

⁸ In the 1968 study the respondents were, as in 1966, first put through a screening question which eliminated the apoliticals. They then replied to questions about their attention to the four levels of politics. For state politics the question read: "And how about affairs here in (STATE WHERE R LIVES); do you pay a great deal, some, or not much attention to state affairs?" Rank orders of relative interest were obtained after these questions.

Given previous work with the local-cosmopolitan dimension, a positive association between rank orderings for state and local affairs would be hypothesized. Rank order interrelationships can be demonstrated in a fairly straightforward way without the added refinement of spatial or scaling techniques. The respondents' rankings of state politics were crossed against their rankings of each of the other three levels of politics. From these matrices were extracted the sum of respondents who allocated either a first or second rank to each of the other three levels. These proportions are as follows:

First or Second Rank Given to:	State Affairs Ranked:			
	First	Second	Third	Fourth
International	5	9	30	40
National	43	38	42	37
Local	52	52	28	23
	100%	99%	100%	100%

Without doubt, the higher the salience of state affairs the higher is that of local matters and, on the other hand, the lower is that of international affairs.

An easy transition between and intermixing of state and local politics creates a sizable cluster of people who are state and locally oriented. Another way of viewing these rankings is to think of people living in the same geographical area, but focussing their attention upon different political objects. There is a state public—overlapping in great part with the local—and a more cosmopolitan public. Both cosmopolitan and state-local political processes operate simultaneously within a given area; but the “separate” publics of each level probably filter out to varying degrees the information about processes less relevant for them.

Having set forth the concept of salience maps and the place of the states in such maps, we can now turn to two major sets of questions. First, we are interested in the attitudinal and behavioral corollaries or consequences of differential state salience. Other things being equal, the various psychological theories of balance, congruence, and consonance would suggest a probable linkage between high state salience and the favorable evaluation of objects associated with states, and a negative evaluation of objects foreign to the states. Similarly, high salience should be associated with greater behavioral activity in the domain of state politics.

Second, we are concerned with the determinants of distinctive state salience maps. These may be presumed to flow from two sources, one

social and the other political. A variety of social experiences are ordinarily associated with narrower, more provincial perspectives. These lead us to predict that state salience will vary with the nature of these experiential histories. The strictly political factors to be considered are state-specific. Although theoretical underpinnings are less apparent here, we will take as a point of departure the progressive, “good government” model of politics. This model would suggest that the more the state political system conforms to the tenets of progressive democracy, the more interested will be the citizenry in the state as a political institution. That is, salience maps will vary with (good) systemic properties, *ceteris paribus*.

In the analysis to follow we have collapsed the four rankings of state politics into two by combining ranks one and two into “high,” and three and four into “low.”

III. SALIENCE, ATTITUDES, AND BEHAVIOR

While one can argue that determining the distribution of differential salience maps is important in and of itself, the subject will be more compelling if it can be shown that certain attitudes and behaviors accompany the different configurations. For instance, it can be demonstrated that there is a connection between salience levels and affective orientations. Those following state affairs could, in fact, be responding to negative impressions about the state's institutions and leaders. Given the need for consonance rather than dissonance in the human psyche, it seems more likely that there would be a “strain toward congruity.”¹⁰ Attention and favorable dispositions do, indeed, occur together. One example is that those who pay more attention to state politics accord higher prestige to the occupation of governor than do those paying less attention ($\gamma = .32$).¹¹ That is, there is greater

¹⁰ For experimental evidence see, *inter alia*, Milton J. Rosenberg, et al., *Attitude Organization and Change* (New Haven: Yale University Press, 1960).

¹¹ The question read: “Now we're interested in learning what kinds of work Americans respect most highly. Which of these occupations do you respect the most?” Three choices were made. The list included, in this order: “U.S. Senator, Bishop or other church official, general or admiral, famous doctor, justice of the U.S. Supreme Court, atomic scientist, professor at a large university, President of the U.S., well-known athlete, president of a large corporation like General Motors, governor of your state.” Altogether governor was the fourth-most choice, being tabbed by 29% of the sample. The correlation in the text is based on first choices.

identification with a symbol (role) connected with the more salient level of government.

By drawing upon data from the 1968 election study it is possible to show more precisely the connection between salience and affect. Respondents rank ordered their faith and confidence in the three levels of the American federal system—national, state, and local.¹² Comparing salience and confidence levels reveals that as the salience of a state's politics rises so does the evaluation of that government's performance. Just as people tend to pay more attention to candidates they like, and vice versa, so too they seem to operate in a selective fashion with respect to political units such as the states. Again, there is no particular reason to suppose that this pattern would not hold for the 1966 sample with which we have been dealing.

Inferentially, the relatively more attentive public for state politics would seem to provide sources of political support for the ongoing performance of state officials.¹³ While the overlap of attention and support is a pleasing state of affairs for state officials, it also raises the possibility of a tacit exchange between these officials and the supportive public. The convergence between support and favorable perception suggests that the values of the attentive public are echoed and legitimized by the state's elites. In any event, if people for whom state politics is highly salient have socio-political views differing from those of the less attentive public, and if there is meaningful interaction between and among elites and attentive publics, then it should follow that the state's political life would vary according to the mix of people more closely attuned to state affairs. It becomes relevant,

¹²The questions ran: "We also find that people differ in how much faith and confidence they have in various levels of government in this country. In your case, do you have more faith and confidence in the national government, the government of this state, or in the local government around here?" "Which level do you have the least faith and confidence in—the (——) or the (——)?"

¹³Any further exploration of the linkage between salience maps and support structures needs to take into account such support dimensions as delineated by David Easton, namely, specific-diffuse; overt-covert; and direct-indirect. See his *A System Analysis of Political Life* (New York: Wiley, 1965), pp. 153-340. For an investigation of support processes at the state level see G. R. Boynton, Samuel C. Peterson, and Ronald D. Hedlund, "The Structure of Support for Legislative Institutions," *Midwest Journal of Political Science*, 12 (May, 1968), 163-180.

then, to assess the political values of this attentive public.

We may begin by noticing that people who pay more attention to state politics are basically less trusting of the world about them. They are more likely than others to say that one can't be too careful when dealing with other people rather than affirming that most people can be trusted ($\gamma = .31$). They are also more inclined to think that their fellow man is primarily looking out for himself rather than trying to be helpful to others ($\gamma = .19$). By ranking state politics higher than national and international affairs an individual has given a hint that he may be suspicious of larger, more remote environments. His more distrustful orientation toward other people rests comfortably in this outlook.

Attitudes more manifestly political give some glimpse into the way state-oriented individuals view national government and its role in their own lives. Those inclined toward state affairs avow more often that what Washington does makes less of a difference in their personal lives ($\gamma = .30$). In one sense this is a confirmation of our earlier speculation that a system-level salience map reflects in part an issue salience map, since state-oriented citizens see less subjectively important outcomes at the highest level of the federal structure.

Given the subjectively lesser importance of Washington decisions, it would be anticipated that the special public of the states is concerned about the increasing erosion of state decision-making by the federal government. Such concern is present, though not as visible as might be expected. Those attuned to state matters more often say that the federal government is playing too powerful a role in society ($\gamma = .16$). By the same token they more often oppose Washington's taking a strong role in integrating the nation's schools ($\gamma = .21$). The lack of stronger relationships may proceed from the fact that such people may simply not feel threatened by an actor (Washington) which is of lesser importance to them in general.

It should be noted, incidentally, that the prominent political orientation of party identification bears almost no overall relationship to state salience: ($\gamma = .08$), using the S.R.C. seven-point party identification measure which runs from strong Democrat to strong Republican. This is so despite the fact that, nationally, the Republican party is often linked with a states' rights position. Actually the only region in which party identification has an observable connection with state salience is the South, where Democrats more often rank state affairs higher ($\gamma = .21$). For the other regions the relationship is nil.

Although virtually all the above relationships persist within each category of the control variables employed,¹⁴ they are more marked among some strata. The prime example is not socio-economic or spatial; rather, it is by political strata. Non-voters in the 1966 general election (and to a lesser extent non-voters in the 1966 primary contests) exaggerate the original correlations. Thus the relationships are heightened for non-voters versus voters when salience is related to a disavowal of Washington's impact (.54 vs .15); belief that the federal government is too powerful (.30 vs .11); and being against federal intervention in school integration (.28 vs .17).¹⁵

Identification with the state is as much or more symbolic than active for the non-voters. Denying the relevance of a disliked national government, they interpose the state as a symbolic barrier between the national government and themselves. These and other variations denote a multiplicative effect, whereby salience maps are especially linked to views about the federal government among citizens with certain characteristics. Consequently, the practical, political effects of varying proportions of state-oriented residents in the state depend upon other traits of these residents.

Perhaps the most acute test of the impact of differential attention toward state politics comes in examining overt behaviors. If the concept of diverse salience maps is to have viability, some behavioral manifestations are in order. Should these be found, it would suggest that the fabric of a state's politics is further mediated by or informed by the distribution of interest orderings.

It may be stated at the outset that close followers of state politics are, in many respects, slightly less participative than are those less devoted to state politics. For example, they report following public affairs and politics often ($\gamma = -.20$), they vote less often in presidential elections ($\gamma = -.16$), they had less interest in the 1966 congressional campaign ($\gamma = -.13$), knew a little less about the candidates ($\gamma = -.10$), and were just a shade less likely to vote in the congressional election ($\gamma = -.08$). These relationships seem at first glance to cast doubt on our earlier demonstration (with the 1968 sample) that relative interest in state politics was linked to absolute interest. However, the declining magnitude of these correlations as one moves

from a general interest in politics on through to activities reflecting participation in congressional races contains a hint that the closer the activity is to state and local matters the more likely will this pattern be erased or even possibly reversed.

Such proves to be the case. There is absolutely no difference in turnout for the gubernatorial election in those states where that office was at stake. Furthermore, those most interested in state politics more often reported voting in the 1966 primaries ($\gamma = .15$). Finally, an indirect indicator of a linkage between state-level salience and forms of participation is that the more attention paid to state matters the greater is the likelihood of voting a straight party ticket in the 1966 state and local elections ($\gamma = .17$).¹⁶ The general drift of these admittedly modest correlations over a range of behavioral phenomena suggests that a higher focus on state affairs may depress participation within nationally oriented politics but enhance it at state and local levels. Thus the concept of attentive publics is given a behavioral as well as attitudinal dimension.

These overall relationships disguise some fascinating interplay between state level salience and other factors associated with political participation. It is well-known, for example, that education is positively related to both spectator and participatory levels of politicization. Since—as shall presently be demonstrated—education is inversely related to the attention paid state politics, it might be assumed that the generally negative relationships between state level salience and political participation are a function of education. If this were so, it would not account for the absence of a relationship with turnout in the gubernatorial election and the presence of a positive association with turnout in the primary balloting. Nevertheless, it is true that at least some portion of the meager relationships are a function of the confounding influence of educational attainment. What is much more intriguing, though, is that education and the attention directed toward state affairs interact with each other to produce strikingly divergent patterns of political behavior.

This process is best illustrated with three measures: interest in the 1966 congressional campaign, voting in the 1966 general election, and voting in the 1966 primary. It will be recalled that the bivariate correlations between interest in state politics and affirmative responses to these three items were either slightly negative (for the first two) or positive (for the latter). By noting the correlations at each of four educa-

¹⁴ Controls included region, urbanization, education, subjective social class, interest in public affairs, voting regularity, and party identification.

¹⁵ The results obtained when controlling for voting participation are not artifactual of differential turnout rates by region or urbanization.

¹⁶ This holds true among Democrats and Independents, but not for Republicans.

FIG. 1. Relationship Between Salience of State Politics and State-Level Participation, by Education.

tional levels it is possible to see the profound interaction effects between education and state interest. There is considerable deviation around the aggregate bivariate correlations. This is shown in Figure 1, which contains plottings by educational level for each of the three measures. Among the less educated, following state politics is marked by less interest and voting. As education rises these negative relationships either decline or move to the positive side. Finally, among the well-educated being attuned to state politics exerts a very positive effect. A similar pattern holds among the subsample located in states with a gubernatorial contest in 1966.

These changing relationships are not easily accounted for. One line of explanation is that the salience of state politics for the poorly educated and the well educated attentive publics rests upon different bases of psycho-political orientations. For the poorly educated, who have much less factual knowledge about state politics, the attachment is primarily affective, a buffer against a fearsome intruder. For the better educated, high interest in state politics takes a more instrumental form, whereby participation becomes more meaningful. If, indeed, the better educated transform their attention levels into more participation via an instrumental orientation, then it should follow that the participation levels in state (and local) elections would be higher for those paying more attention to state

politics. As we observed, this is precisely the case.

It is more difficult to say why the attention level is inversely related to participation among the poorly educated. Perhaps their more affective orientation, when combined with a higher interest in state politics, results in a perspective that voting accomplishes relatively little. High affective symbolic orientations may reduce the need for participation. Inner gratification flows from withdrawal and non-participation.

IV. INDIVIDUAL AND DEMOGRAPHIC BASES OF STATE-LEVEL SALIENCE

The place of state politics in an individual's attention frame will be a function of formative experiences—summed up in the term political socialization—as well as more contemporary factors denoting the type of life space occupied by the individual. Here we concentrate on the various "static" characteristics rather than on those reflecting dynamic elements.¹⁷

Where a person was reared says something, in gross terms, about his family of orientation, the life style around him, and the nature of the surrounding political culture. It is apparent that the more urban a person's upbringing the less likely he is to pay attention to state politics (panel 1, Table 3). A similar pattern may be discerned in terms of contemporary residence. For convenience, we have categorized locations in terms of the twelve largest standard metropolitan statistical areas (SMSA), other SMSA's, and non-SMSA areas. The more urban or metropolitan the area the less compelling are state affairs (panel 2, Table 3).

A third locational factor is that of region. As with the other spatial variables, region is a summary construct. That is, it often captures (imperfectly to be sure) a set of historical experiences, socialization patterns, life styles, and political culture differences which are relevant to certain political phenomena. Two recent illustrations of "regionalism" are the findings that the adoption of policy innovations and the patterns of state expenditures have distinct, independent regional components.¹⁸ It can also be argued

¹⁷ An attempt to look at the nuances of state level salience over the life cycle will be found in an extended version of this article to be published in Edward C. Dreyer and Walter A. Rosenbaum (eds.), *Political Opinion and Electoral Behavior* (rev. edition, Belmont, Calif.: Wadsworth, forthcoming).

that, even if region as a term simply disguises the "real" underlying dimension at work, this still does not alter the fact that the distribution of opinion and behavior within a region—hence the states in that region—is different, and that

mic Development, Regionalism, and State Political Systems," *Midwest Journal of Political Science*, 12 (February, 1968), 41-59. See also Samuel Stouffer, *Communism, Conformity and Civil Liberties* (New York: Doubleday, 1955); Norval D. Glenn and J. L. Simmons, "Are Regional Cultural Values Diminishing?" *Public Opinion Quarterly*, 31 (Summer, 1967), 176-193; and M. Kent Jennings and Harmon Zeigler, "Political Expressivism Among High School Teachers: The Intersection of Community and Occupational Values," in Roberta S. Sigel (ed.), *Learning About Politics: Studies in Political Socialization* (New York: Random House, 1970).

these differences may either reflect or produce different political processes. In the case at hand it turns out that the salience of state politics does vary among the regions, with Southerners being most attuned to state matters, Westerners next, and Midwesterners and Northeasterns least (panel 3, Table 3).¹⁹ Similar proportions emerge by taking the individual's region of birth instead of current region.

A slight diversion is necessary here to comment on the possible historical and contemporary reasons for these regional divergencies. In one cluster are the Southern states, bound by the pains, memories, and dislocations of an historical trauma. To say that the states have a unique place in past and present Southern politics is to repeat a commonplace. At the other extreme is the cluster of Northeastern and Midwestern states, those states generally considered most cosmopolitan in outlook, the major repositories of the great economic, cultural, social, and political institutions of the nation. Between these two clusters are those states which may be characterized as Western and hybrid in nature. Settled in large part by immigrants from other states, carved in part out of the former federal territories, ushered into statehood at a time when the trend was toward stronger state government,²⁰ and physically remote from the centers of national power, these states have neither the high cosmopolitanism of the Northeastern-Midwestern tier, nor the scars and ethnocentrism of the South. It remains to be seen whether these regional patterns persist in the light of various controls which shall subsequently be applied.

To the locational factors may be added those characteristics reflecting a person's social status and life style. The higher a person's formal education and subjective social class the less interest he evinces in state politics (panels 4 and 5, Table 3). This pattern echoes the well-known propensity of the better off and better educated to be more concerned than lower status people with broader environments. In view of this it is

¹⁹ Regional groupings follow Census Bureau classifications: Northeast = New England and Middle Atlantic states; Midwest = East North Central and West North Central states; South = South Atlantic, East South Central, and West South Central states; and West = Mountain and Pacific states. Other regional combinations were employed, but with less rewarding outcomes.

²⁰ Daniel Elazar discusses the historical tendencies toward state centralism versus localism in *American Federalism: A View from the States* (New York: Crowell, 1966), pp. 186-193.

not surprising that those from the working class and lower educational strata are more likely to form a portion of the attentive public for state politics.

While the demographic and social strata components supply a substantial amount of differentiation, there are also temporal factors at work. One of these is simply the individual's length of residence in his state. The common-sense hypothesis that the longer a person resides in a state the higher the salience of that state's politics for him is borne out by the data (panel 6, Table 3). At this aggregate level the differences are not marked, but are clearly in the hypothesized direction.

We now know that the amount of attention devoted to state affairs differs according to several social and spatial characteristics. Of additional importance is whether the observed patterns hold under a variety of control conditions and whether there are cumulative effects at work. The answer to the first query is unequivocal. With only one exception²¹ the original bivariate associations are maintained when controls are exerted for each of several other variables. For example, the basic negative relationship between SMSA size and state level salience persists regardless of rearing site, region, education, social class, and length of state residence. With some confidence one can say that the social and locational factors cited above have an independent impact on the probable occurrence of divergent salience maps.

Although the staying power of the various characteristics constitutes an important aspect of the analysis, it is significant that there are also cumulative processes at work. Two examples will depict what is, for the most part, a common form of behavior when two of the predisposing factors are combined and then related to state politics salience. One instance of this process comes by combining educational attainment and the site where the individual was reared. It was established previously that the higher one's education and the more urban the rearing site environment the less salient is state politics. Now if these two factors operate in an additive fashion when combined it should mean, for example, that the highly educated from urban areas would be especially prone to rank state affairs low. Without doubt this is the case. Only 28 percent of the college educated per-

sons reared in a city placed state politics high. On the other hand, 74 percent of the elementary educated respondents who were reared on farms gave high prominence to state affairs. Percentages between these two poles tended to reflect very faithfully the operation of additivity principles.

A second example of the cumulative processes at work merges education and region. In addition to knowing that education is negatively related to following state affairs and that pronounced regional variations exist, we also know that educational differences persist within each of the four regions (α : South = $-.32$; West = $-.34$; Midwest = $-.34$; Northeast = $-.23$). Under such conditions it should come as no surprise to find that by categorizing people in terms of both education and region the range of high interest in state affairs is elongated. Furthermore, the elongation conforms remarkably well to the predicted values, assuming additivity.

Figure 2 contains two lines, one showing the predicted order of values under an additivity model, and the other showing the actual values attached to those predicted for each region-education combination. While the lines do not follow the same precise path, the actual proportions adhere rather nicely to the predicted ones.²² That is, given four overall regional means, the effects of education are roughly similar across each region. Conversely, given different educational strata means, the effects of region are approximately the same across each educational strata.

Because we are dealing with a national sample, none of the foregoing results would apply with certainty to particular states. Yet to the extent that the nationally-based findings provide state-specific clues it is clear that salience maps possess quite different configurations according to some well-defined individual and demographic properties. Short of dramatic events, the states thus seem destined to be populated by unequal proportions of state-attentive publics.²³ How

²¹ The deviant case is that of length of residence controlled by region. Interest in state affairs does not increase with length of residence in the West ($-.05$), a finding no doubt occasioned by the continued Westward migration of the populace. Correlations for the other three regions are South = $.39$; Northeast = $.26$; Midwest = $.16$.

²² The monotonic ordering and predicted values for given combinations were constructed by taking the marginal values from the appropriate column and row intersected by the cell (combination), and adding these row and column effects to the grand mean. The intercorrelation problem was handled by utilizing Multiple Classification Analysis, a program which helps remove the intercorrelation effects. Nearly identical results were obtained by using James Coleman's partitioning formulas. See his *Introduction to Mathematical Sociology* (New York: The Free Press of Glencoe, 1964), Ch. 6.

²³ The sheer rates of interstate mobility impose a strong restraint on change. Contrary to popular impressions Americans do not change state of

Salience for Region-Education Combinations

^aGrades 0-8, 9-11 have been combined because of small N's.

much and in what ways these inequalities affect the state's political life cannot be answered here, nor are they easily solved questions. Their solution, however, should enrich our comprehension not only of intra-state politics but also that of the linkages among the various levels of politics in the federal union.

V. SYSTEMIC BASES OF STATE-LEVEL SALIENCE

Each state comprises a set of distinctive social and political phenomena. Assuming individual-system interaction, the question is whether the individual's salience map will vary with the particular kind of political system in which he finds himself. To some extent, of course, the summary

residence with great frequency. For the present sample 63% had lived their entire lives in one state and another 24% had spent at least 20 years there.

variable "region" freights a political element; but here we wish to treat specific political indicators. In particular we will introduce a number of systemic properties which should be positively linked to state-level salience according to the good government, healthy competition, active citizenry view of politics.

One of the more significant and obvious aspects of a state's political life is the level of mal-apportionment in the state legislature. It might be thought that the better the apportionment, the more interested would people be in state politics: such is the "good government" view of the political world. That it is a false view is demonstrated by the negative relationship (−.27) between following state affairs and the fairness of apportionment—using the 1960 David-Eisenberg Index.²⁴ This association shows

²⁴From Paul T. David and Ralph Eisenberg, *Devaluation of the Urban and Suburban Vote*,

a remarkable persistence under a variety of control conditions. Region is an especially critical control to impose here since the South, which is relatively malapportioned, is also the area containing the largest number of state-oriented respondents. Nevertheless, with Southerners removed from the sample, the negative association persists ($-.21$); and in no region does a positive trend emerge.

Much the same conclusion can be reached about the degree of inter-party competition. Let contests for the governorship and Hofferbert's omnibus inter-party competition index serve as indicators of state-level competition.²⁵ While it might be expected that the more spirited the competition between the parties the more salient would be the politics of the state, the opposite is true. Regardless of which measure is used the relationships are negative, even though not strong ($-.24$ and $-.22$ for the governorship and Hofferbert's index, respectively). Again the pattern tends to persist under a variety of control conditions, including region.

Another common variable used to characterize the state's political culture is that of election turnout. In general it is argued that the higher the turnout the more vigorous the level of politics. Turnout for gubernatorial and U.S. senatorial contests will be used as a safe guide to the state-specific forces activating differential turn-

out. The common-sense hypothesis is that the higher the voting participation the higher the salience of state politics for the state's inhabitants. Such is not the case, however. There is, in fact, a small tendency ($-.12$) for salience levels to decline as turnout rises. Whatever forces are acting to develop a high following for state matters, they are not very well described by the differential participation of the electorate.

It has become apparent that for many people the affairs of government are wrapped up in what a few of the very visible political officeholders do. Accordingly, it might be advanced that the stronger the office the more salient would be the institutions, activities, and processes surrounding that office. While it is obviously true that a personable, aggressive governor can capture a substantial amount of attention regardless of the statutory limitations on his power, it seems reasonable to suppose that the same sort of governor with an arsenal of legal powers could do even more to make himself and the state government topics of conversation. As it turns out people living in states with powerful governors²⁶ are no more likely to follow state affairs than are people living in a state with weak chief executives. What correspondence exists is actually on the negative rather than the positive side ($-.12$).

As noted earlier, many of the recent investigations about state politics have treated the determinants of public policy outputs. Because the great share of operational measures so far developed for assessing state policy outcomes are based on expenditure items, we are restricted in examining the connection between salience and state performance. The "good government" advocate would argue that the more active the state government, the more salient it would be for its residents. There is but meager support for that proposition. Trivial, positive relationships (ranging from $.02$ to $.14$) exist between high salience and the number of state government employees per one thousand population, state expenditures per \$1,000 income, and state expenditures per capita. Slight negative associations are found between salience and state aid to cities and recent (1950-1960) changes in general state expenditures. These are all single indicators. Employing a ranking of the states based on Crittenden's "Scope of Government" factor²⁷—which has very high loadings on tax level per capita, tax level per income unit,

Vol. I (Charlottesville, Virginia: Bureau of Public Administration, University of Virginia, 1961). Although widespread reapportionment has occurred since the *Baker v. Carr* decision of 1962, most occurred after 1964. Indeed the latest reapportionment of both legislative houses occurred as late as 1965-66 for thirty states and 1967-69 for eight states. Given the time lag between legal changes of this sort and their imprint on the mass public, it seems advisable to use the 1960 malapportionment figures for our 1966 sample. To utilize this measure and the ones to follow the respondents have been allocated into roughly equal quartiles or quintiles according to the scores of the state in which they resided. It can be shown that the distribution of the sample across groups of states with varying score ranges approaches the distribution for the universe.

²⁵ The gubernatorial measure is based on contests from 1946-62, and is taken from Dennis Riley and Jack Walker, "Problems of Measurement and Inference in the Study of the American States," (unpublished paper, University of Michigan, 1968). Hofferbert's index is reported in Richard I. Hofferbert, "Classification of American State Party Systems," *Journal of Politics*, 26 (August, 1964), esp. pp. 562-563. More recent single elections were also used in our analysis; these produced results similar to those for the above two measures.

²⁶ The rankings come from Joseph Schlesinger, "The Politics of the Executive," in Jacob and Vines, *op. cit.*, Chap. 6.

²⁷ John Crittenden, "Dimensions of Modernization in the American States," this REVIEW, 61 (December, 1967), 989-1001.

spending level per capita, and governmental employment—again produces an extremely modest positive correlation (.08). Regional controls reveal the association to be slightly higher in the Midwest and West.

Walker, among others, has argued that it is essential that non-expenditure policies be included in any attempt to explicate the articulation between state performance and socio-economic and political characteristics. In response to his own admonition he developed a set of policy innovation scores for the several states, stretching from the late nineteenth century to mid-twentieth century.²⁸ The "good government" position is that the innovative states would command more interest from their residents than would the laggardly ones. This is hardly the case, however, for the association is but slightly above zero. Unfortunately, few other reliable indicators of state performance are at hand. If we are to judge by the innovative pattern, non-expenditure performance measures are no more likely to affect salience maps of state residents than are those based on expenditures.

Most of the associations involving the foregoing political characteristics exhibit an exaggerated mode among non-voters. For better or worse, the less participative citizens react to the political culture in a more severe fashion than the more participative. That is, if a system manifestation such as malapportionment accompanies greater interest in state affairs, it is especially prone to do so among the less participative. One can picture them as less autonomous and self-assured than their more participative fellows. Environmental forces thus come to have more impact on them. There would seem to be a certain perversity about this, but apparently the less active citizens are, in effect, bolstered by these aberrations from what the reformers and democratic theorists see as progressive democracy.

CONCLUDING REMARKS

The concept of salience maps has been used to explore the relationship of the citizenry to their state governments as a particular set of institutions in the American political system. People do organize their cognitive views of the political world such that some system levels assume more prominence than others. There are indications that cognitive and affective dimensions of state salience are inter-locked. Attitudinal and behavioral corollaries of differentiated salience maps

depend in part upon one's social and political status. One of the most emphatic though somewhat puzzling findings is the degree to which these corollaries are exaggerated among less participative citizens. Correspondingly, the salience of state politics among these less active people varies more according to environmental forces than is true for the more active.

Broadly speaking, the forces which contribute to following state politics can be grouped into two categories. On the one hand, there are those factors which are essentially "given" or uncontrollable. On the other hand, there are other factors which are more subject to elite manipulation and political change. Place of residence, education, social class, and the like are—to a greater or lesser extent—set for the individual. To a similar extent, the states have limited control over these aspects of a person's life.

Asserting that these factors are given is not to adopt a crudely deterministic stance. Rather, it is to hold them in contrast to another set of variables that are substantially more malleable. State outputs, such as program expenditures or policy innovations, are more amenable to the short-run persuasive efforts of elites and the occasional demands of masses. These are the areas of a state's political life that attract a good deal of attention from political scientists and specialized publics, but have precious little positive impact upon the salience maps of individuals. The contours of such maps are determined largely by the individual's life experiences and the characteristics of his immediate life space.

We have suggested (though not demonstrated) that a state's policies are partially determined by the attitudes and behaviors of its attentive public. However, the obverse of this proposition is not necessarily correct: the attitudes and behaviors of the attentive state public reflect dimly, at best, the quality of a state's public policy. Arguments that a vigorous, strong, and innovative state government produces an interested public are open to question. So, too, are the emphases placed on such touchstones of liberal democracy as inter-party competition, equal representation, and enthusiastic electoral participation.

Whatever the correlates of state-level salience, it is apparent that the states still loom large in the perspectives of the American public. Any attempted juggling of political units involving the states would probably confront a reservoir of mass attachments to the states as political entities. Coupled with the historic traditions, legal preserves, and political utility of the states, this salience helps assure the continued prominence of the several states within the federal system.

THE "MOOD THEORY": A STUDY OF PUBLIC OPINION AND FOREIGN POLICY*

WILLIAM R. CASPARY

Washington University, St. Louis

This paper is concerned with assessing the stability of the American public's attention to foreign affairs, and the relationship of this to public support of international programs and commitments. In particular, the paper presents an empirical investigation of the evidence for the "mood theory" proposed by Gabriel Almond as one element of his classic study, *The American People and Foreign Policy*.

The mood theory contends, first of all, that attention to or interest in foreign policy is generally low and subject to major fluctuations in times of crisis.

The characteristic response to questions of foreign policy is one of indifference. A foreign policy crisis, short of the immediate threat of war may transform indifference to vague apprehension, to fatalism, to anger; but the reaction is still a mood.¹

* This research is a segment of a larger project on public reaction to international events (see also, William R. Caspary, "United States Public Opinion During the Onset of the Cold War," *Peace Research Society (International), Papers*, IX (1968), 25-46; and "Dimensions of Attitudes on International Conflict," *Peace Research Society (International), Papers* XIII (1970, forthcoming). This research has been partially supported by grants from Northwestern University and Washington University. Survey data of the National Opinion Research Center (NORC), and the American Institute of Public Opinion (AIPO), was obtained from the Roper Public Opinion Research Center. Supplementary survey data was provided by the library of NORC. The author gratefully acknowledges the help he received from these sources and from individuals associated with these institutions.

It may interest the reader that, during the more than four years that have elapsed since this article was first written in substantially the present form, my own interests have shifted considerably. If one is passionately concerned as I am with the injustice of the U.S. globalist—or, if you will, imperialist—foreign policy, research of the sort presented here seems a rather sterile exercise. My current work is devoted to a study of the economic, ideological, and bureaucratic sources of American interventionism in the undeveloped world.

¹ Gabriel A. Almond, *The American People and Foreign Policy* (New York: Praeger, 1960), p. 53.

On the basis of this premise about attention, Almond predicts that the *public* will not provide stable support for international commitments undertaken by the U.S. Government.

Because of the superficial character of American attitudes toward world politics . . . a temporary Russian tactical withdrawal may produce strong tendencies toward demobilization and the reassertion of the primacy of private and domestic values.²

The acceptance of this view by scholars is evidenced by its presentation in important textbooks and treatises.³ As far as I have been able to determine it has not been challenged.

The empirical investigation in this paper considers evidence on both of these variables—attention=interest, and support for foreign policy commitments.

It should be remembered that Almond warned against over-reaction to the Soviet threat as well as the tendency to demobilize. Discussion in this paper of popular support for American foreign policy should not be taken as indicating the author's support for the "globalism," the "Pax Americana" strategy that characterizes that policy today.

I. STABILITY OF POPULAR SUPPORT FOR OVERSEAS INVOLVEMENT

In marked contrast to the mood theory is a result we have obtained from national public opinion poll data gathered by the National Opinion Research Center (NORC). This result is the remarkable stability of strong popular support for an active U.S. role in world affairs. Trend data on the item: "Do you think it will be best for the future of the country if we take an active part in world affairs, or if we stay out of world affairs?" are shown in Figure 1. The

FIG. 1. Percent supporting an active part in world affairs for the U.S., over time.

average percentage favoring an active part is 71%. The standard deviation of the points from the average is only 1.8%, less than the expected sampling error. This remarkable stability occurred over a time of violent change in world affairs from war to peace and demobilization, through the onset of the cold war and the shock of the Korean struggle. The popular commitment to an active U.S. role, however, did not appear to waver.

Some of these data were available when Almond wrote. His evaluation of this item on an active part in world affairs, however, stressed that it is an "emotionally loaded question" which evokes responses which misrepresents the amount of concern Americans have for foreign affairs. Nevertheless, I find that the respondent's answers to this question is an excellent predictor to his response on a wide range of policy questions involving international commitments. The tests of this relationship are shown in Table 1. Across 47 different tests, the average value of gamma is .50.

In the light of the strong association between the stable internationalism indicator and specific policies, it is not surprising to find that support for individual policies is also fairly stable (see Figure 2). Support for military aid to Europe was followed in NORC polls over an eight

year period. The support which fluctuated around 50% of the sample during the late forties gave way to slightly higher, but equally stable support after the Korean war. Though data were collected for shorter periods, the results for Marshall plan aid, military aid to Europe, support for NATO, and willingness to intervene militarily against a Communist attack also show impressive stability.

To a certain extent, Almond's interpretation allows for these findings. He formulates the concept of "permissive mood" to characterize the passive acceptance by the public of internationalist policies formulated and urged by its official leaders.⁴ He sees this permissive mood as a particular characteristic of the Cold War situation in which the threat of the Soviet Union at least temporarily forces Americans to accept international commitments. Almond repeatedly warns, however, that this is a mood response and not an intellectually structured one. The mood may change if the international environment does. "The undertow of withdrawal is still powerful."⁵

The question is whether Almond would have anticipated the amount of stability that our data indicate. Suppose we give a more precise

	Keep occupation troops in Japan	.68
	Keep occupation troops in Korea	.65

formulation of Almond's analysis as follows: the percentage of people supporting international commitments will vary directly with the percentage perceiving a given level of threat from the Soviet Union. To test this, we will use as an indicator of perceived threat, the expectation of war. This indicator has several things to recommend it. It correlates strongly with various other items on expectations of Russian behavior, and trend data is available which is sensitive to changes in Soviet behavior and pronouncements.

Comparison between the trends in expectation of war and in support for an active U.S. role is shown in Figure 3. As we have already seen, support for an active role scarcely fluctuates. Expectation of war, on the other hand, shows fluctuations up to 50%. Clearly a direct ratio between the two variables does not hold.

A weaker formulation that is also consistent with Almond's analysis is that support for an active role should remain steady at some high level as long as perceived threat is above some threshold value. In this formulation, support for an active part would decline sharply if perceived threat fell below the threshold. From 1947 through 1953, the period covered by our data,

FIG. 2. Percent supporting internationalist policies, over time.

FIG. 3. Internationalism and perceived threat, over time.

more than 47% of the population expected war within ten years. But in November 1946, when NORC first asked about expectation of war, only 28% thought it likely within ten years. If the question had been asked in the immediate post-war lull, the figure would probably have been even lower. Nonetheless, support for an active part remained steady around 70% at these times.

In any event, the threshold formulation has weaknesses on theoretical grounds. The aggregate results with which we are dealing come from summing over individuals who are likely to exhibit different thresholds and to perceive different amounts of threat at a given time. A slight easing in Soviet pressures would probably mean that all individuals would perceive slightly less threat. If Almond is correct that the commitment is only a response to threat, some individuals would cross their personal thresholds and no longer feel compelled to support an active U.S. role.

II. MENTION OF INTERNATIONAL PROBLEMS AS AN INDICATOR OF "ATTENTION" OR "INTEREST"

Almond's pessimistic expectation of unstable commitments is based on his belief that the characteristic response of Americans to foreign policy issues is indifference. His data lead him to see "(1) the extreme dependence of public interest in foreign affairs on dramatic and overtly threatening events; (2) the extraordinary pull of domestic and private affairs even in periods of international crisis."⁶ This conclusion is based upon trend data on one questionnaire item.

One of the most interesting accumulations of evidence on this general question of the focus of public attention is a series of Gallup polls which has been conducted since 1935. On more than twenty occasions during the fifteen year period the American Institute of Public Opinion has asked a sample of the public: "What do you regard as the most important problem before the American people today? . . . The form of this question has the advantage of registering spontaneous responses. In the multiple choice or 'yes-no' type of question one can never be sure that the respondent draws a clear distinction between what really is on his mind and what he thinks ought to be on his mind. The undirected response is a more reliable indication of the real degree and extent of spontaneous interest in foreign policy problems."

This question was coded for whether the respondent mentioned an international problem or a domestic one. The percentage of the sample

mentioning international problems over the years, as reported by Almond, is shown in figure 4.⁸ If this item is indeed an indicator of attention to or interest in foreign affairs, then it is plain that there have been dramatic fluctuations in interest and/or attention. It is also clear, as Almond elaborates in his book, that the peaks of the trend line come at times of international crisis such as the Communist coup in Czechoslovakia and the Italian elections of 1948. Similarly the troughs of the curve show preoccupation with domestic concerns such as economic reconversion in the wake of World War II.

But is the mention of an international problem really an indicator of interest or attention? It would seem on the face of it that this is so, but surprisingly enough this response shows rather weak association with the respondent's judgment of how interested he is in China ($\gamma = .157$), the United Nations ($\gamma = .141$), and England's financial crisis ($\gamma = .146$). It may be that, as Almond says, the open-ended question is a more trustworthy indicator since it does not structure the replies or favor a particular alternative. On the other hand, one would expect a somewhat stronger association between the two.

To test this further, let us look at another indicator of attention—whether the respondent says he has heard or read of a particular foreign policy issue or international event. This item was frequently used and we have a total of 12 tests of association between it and mention of an international problem. These are shown in Table 2. Although the association is quite weak (γ less than .13) for five of these, the rest show stronger association. In all but one of these cases it turns out that the attention items cut the population into a large group aware of some important event and a small group that is unaware. It appears that only the people at the bottom of the attention scale differ significantly from the rest in their tendency to mention international problems. I shall discuss the significance of this finding in Section III.

The question about hearing or reading of an event, like the one about interest, may tempt the respondent to give a false report in order to gain the interviewer's approval. The respondent cannot, however, falsify replies to requests for factual information. Five such questions have appeared on surveys along with the item on the most important problem facing the country. The results of tests of association between these two variables are shown in Table 3. Three of the tests show very weak association (γ less than .09). Of the other two, one uses an indic-

⁶ *Ibid.*, p. 72.

⁷ *Ibid.*, p. 71.

⁸ *Ibid.*, p. 73.

FIG. 4. Percent mentioning international problems as most important, over time.

ator that discriminates a small group at the bottom of the attention scale. Finally, some additional miscellaneous indicators of attention were used. The results are shown in Table 3. All the associations were weak (gamma less than .14).

The result of these tests (with two minor exceptions) appears to be that for all but the very least attentive respondents an increase in mention of international problems is not likely to be associated with an increase in attentiveness. Though there might have been reason to doubt this negative result on the basis of any one of these indicators, the consistent findings across all of them strengthen that interpretation.

As a further check on the validity of the various attention indicators we constructed a matrix of intercorrelations among them as shown in Table 4. Some of the cells of the matrix are fuller than others because on many surveys not all of the various kinds of indices occurred together. We see in this matrix that all but three of the tests of association show gamma greater than .30 and that most of them are quite strong (gamma greater than .50). This suggests that there is a single dimension of attention which is tapped more or less by all of these items. Structured and unstructured questions, reports of interest and factual knowledge, and actual behav-

ior such as membership in organizations where foreign affairs are discussed all seem to be loaded on this dimension. Does trend data exist on these other attention indicators that compares in frequency with the most-important-problem data. The best that is available is four occurrences of the item, "How much interest do you take in the United Nations Organization?" A comparison between this item and the mention of international problems as most important is shown in Figure 5. It is fortunate that the National Opinion Research Center Poll which showed no change in interest in the U.N. at the end of 1958 was taken within a few days of the Gallup poll which registered a striking decline of mention of international problems. This indicates stability of attention to international affairs at a time when domestic events appear to have been exerting a great pull on people's attention. Thus we have not only cast doubt on the evidence from which Almond inferred instability, we have found evidence to the contrary.

III. RATE OF MENTION OF INTERNATIONAL PROBLEMS BY THE MOST ATTENTIVE RESPONDENTS

We have seen that the mention of international problems does not seem to be associated

TABLE 2. ASSOCIATION BETWEEN MENTION OF INTERNATIONAL PROBLEMS, AND AWARENESS OF ISSUES

	Berlin Dispute	.39	11

with this attention dimension, except to the extent that those very low on attention mention international problems somewhat less. Almond, on the contrary, singles out the *most* attentive group as the one that should be different! He expects that stable attention will be characteristic of only those individuals whose attitudes show "intellectual structure" and factual content.⁹ To meet this criterion, an individual must "have explicit evaluations of the relative costs and efficiency of alternative means of maximizing the value position of [his] country."¹⁰

Have we actually shown that this top attention group is not more likely to mention international problems? That would be demonstrated only if the attention tests we have used are finely enough calibrated to discriminate between this group and the others. Almond does not give a clear operational procedure for isolating this "attentive public," but Rosenau estimates on the basis of circulation figures for quality media that the attentive public is "no larger than ten percent of the population and possibly much smaller."¹¹ Roper gives a similar estimate.¹²

A few of the attention indicators we have used

discriminate a top group on the order of ten percent of the population or less, but show weak association with mention of international problems. To check this result, scales were constructed by taking the sum of the scores on two or three separate items. In no case is the top attention group sharply distinguishable from the neighboring ones in frequency of mention of international problems.

If the attentive public indeed has a stronger and more stable tendency to mention international events this difference should show up most at times when the overall percentage of people mentioning international events is low. At times of relative international calm, or at times when domestic events preempt attention, only the attentive public would continue to have its eye focused on international problems and mention them to the interviewer. The lowest level reached in mention of international problems was 28% (AIPO Survey No. 596, March 1958).¹³ The degree of association between men-

tion of international problems and one indicator of attention (heard or read of foreign aid bill) was still quite low ($\gamma = .07$, see Table 2). For all other surveys on which attention measures were available the percent mentioning international problems was 37% or over, and for all but three it was greater than 50%.

marginals from AIPO Survey No. 596, item 2, has appeared in an article by Deutsch and Merriitt. See appendix for details.

IV. INTERPRETATION OF THE WEAKNESS OF MENTION OF INTERNATIONAL PROBLEMS AS AN INDICATOR OF ATTENTION

It would appear, then, that a strong case has been made against using the mention of international problems as most important as an indicator of attention. The reader may wonder why such a major effort was mounted in this paper on behalf of the negative result of contesting the validity of a single indicator. There are several reasons: (a) the indicator has been widely used:

FIG. 5. Interest in the U.N. and mention of international problems, over time.

in addition to Almond's work and the many citations of it, Smith, and Deutsch and Merritt have made important empirical studies which rely upon this indicator;¹⁴ (b) a major proposi-

¹⁴ Paul A. Smith, "Opinions, Publics, and World Affairs in the United States," *Western Political Quarterly*, 14 (1961), 698-714; Karl W. Deutsch

tion about the instability of American foreign policy attitudes based on this indicator may now

and Richard L. Merritt, "Effects of Events on National and International Images," in Herbert C. Kelman (ed.), *International Behavior* (New York: Holt, Rinehart and Winston, 1965).

be called into question; (c) we may be at a stage in the development of this area of inquiry at which it is appropriate to turn from sweeping and imaginative theory construction to the more mundane task of rigorous testing of individual indicators and propositions; (d) we have striven by using a variety of indicators and techniques to make the most of a data pool not designed to produce answers to this particular question. What would be desired, of course, would be an elite sample as well as a general population sample, and a battery of interest and attention measures. Given such data we conceivably could still find that the "most-important-problem" indicator proved to discriminate between the general public and a much smaller elite group on the order of less than 1% of the population. Even for such an elite, however, there are reasons to suspect that this measure will not be a valid measure of attentiveness.

(a) This indicator is a measure of primacy of attention, not of strength of attention. An individual who is inattentive to both international and domestic problems might be slightly less inattentive to international ones and mention one of these as most important. Conversely an individual strongly interested in politics may be slightly more interested in domestic than international issues and mention a domestic one to the interviewer.

(b) The use of the word "today" (or "now" in some variants) may do a great deal of structure the responses by focusing upon immediate problems and crises rather than broad, long term issues. The crisis dominated aspect of public responses which Almond found¹⁵ may be purely an artifact of this wording. Though this interpretation cannot be tested with available data, it is not hard to see how it would be tested in the future. One could simply substitute the phrase, "over the next ten years" for "today."

(c) Mention of international problems as most important is also uncorrelated with indicators of isolationism. Thus there must be substantial numbers of people whose responses were

coded as international who are of isolationist persuasion. When they mention international problems it may be with the thought of how best to withdraw from them. If the isolationists tend to be less attentive than the rest of the population, then their presence would lower the attention score for the group that mentions international problems. Evidence that this does happen is shown in Table 5. The variation within the four major cells of the table is greater than the variation between them.

V. CONCLUSION

The Mood Theory was summarized at the start of this paper as having a premise—generally low and unstable attention to foreign affairs—and a conclusion—unstable support for foreign policy commitments. Empirical evidence has been presented in these pages to show that both the premise and the conclusion are false.

On the basis of these findings I suggest the following alternative interpretation: that American Public Opinion is characterized by a *strong* and *stable* "permissive mood" toward international involvements. Although I have not included any data analysis on current opinion it is tempting to speculate that the support by the long-suffering American public of 10 years of fighting—and 4 years of heavy combat—in Vietnam is an indication of the existence of a permissive mood. It also indicates that such a mood provides a blank check for foreign policy adventures, not just a responsible support for international organization, genuine foreign assistance, and basic defense measures. Almond by no means ignored this line of thought—indeed the notion of permissive mood is his own and he stressed its dangers. There is no indication, however, that he anticipated the strength or stability of commitment to American foreign policy that our data suggests. He appears to have been heavily influenced (as have a number of other commentators) by evidence which we have demonstrated on closer examination to be of dubious validity. Finally it should be noted that we have dealt here with only one element of the rich array of theory and findings in Almond's classic work.

¹⁵ Almond, *op. cit.*, p. 72 (see quote, above, p. 5, footnote 6).

THE RURAL AFRICAN PARTY: POLITICAL PARTICIPATION IN TANZANIA*

NORMAN N. MILLER
Michigan State University

I. INTRODUCTION

Because the codes, rules and ideology of mass, single-party systems reach the village areas more slowly than do the tangible personalizations of party authority, a situation of potential misuse of power exists where rural party organizations operate. Peasants are aware of face-to-face confrontations by a familiar figure who has gained a party position; they are unaware of the precepts and regulations that the national party has laid down for the village level functionaries. Consequently, political victimization is most pronounced at the very grass-root level that national leaders are attempting to integrate politically. Moreover, by its nature the rural party is a multi-faceted organization that is acceptable to the peasants because its leaders provide services that in more structured societies are carried out by specific agencies and contracts. Functions such as family arbitration, police investigation and criminal adjudication are mixed with the more classical party activities of representation and the dispensing of patronage.

Taken together, the above two characteristics of a rural party—potential abuse, and the multi-faceted nature—significantly influence the extent and form of political participation in the areas they serve. This article attempts to analyze these characteristics in Tanzania, and thereafter to assess rural party participation, and more broadly to suggest the theoretical dimensions of political participation in a new nation.

Participation, it may be argued, is the problem *par excellence* for leaders of the new nations. The building of a state, both in terms of economic development and in the creation of a national consciousness, depends upon some type of

participation by the citizens. If the citizen population is dispersed throughout the state in remote homesteads and hamlets, as many African populations are, then the problem becomes one of linkage between the government and the remote populace. To gain participation, new political structures must be built at the rural level, and old institutions must be changed to fit into national goals. Rebellious attitudes by the people must be neutralized and consensus, or at least some support of the national goals, must be gained. It is necessary that rural people be brought into the government's plan, that they accept the government's general viewpoint, and that they provide the will and the manpower to change the status quo. In essence, peasant energy must be expended, muscles used, and attitudes altered if government goals are to be met.

The concept of mass participation presupposes a population shift from a disinterested mass to a participating citizenry. People must accept ideas of individual worth, loyal opposition, and electoral equality. In many new states stimulus for such participation comes from the ruling elite who see participation as a means to insure political stability. In essence, political participation, a degree of political integration, and some economic growth are the price the ruling elite must pay to gain the political stability in heterogeneous societies that will insure their own survival.

Participation, to be meaningful, must be within institutions that have channels of redress to the national level, and, simultaneously, have the capability of bringing about grass-root improvement. In one respect the process is essentially the building of new institutions at the grass-roots level. Mundane changes such as the development of agriculture, the encouragement of land reform, the creation of welfare and extension services, and the building of rural schools, roads, and clinics are necessary for orderly political growth. Participation in rural institutions such as the political party, the local administration, the local councils, the marketing cooperatives, and the local voluntary associations may be either voluntary or coercive. The essential fact is that participation, that is involvement, occurs.¹

*I am indebted to the Inter-University Research Program in Institution Building (Ford), for field support in 1967-68, and to the African Studies Center, Michigan State University for research funds. Some data used in this article was collected during 1964-66 under a grant from the International Development Research Center (Carnegie), of Indiana University. Additional field work was done in 1969 while I was on leave with the American Universities Field Staff. Professors Paul R. Abramson, Henry Bienen, Walter W. Bowring, John Collins, and Carl Rosenberg, Jr. generously offered comment and advice.

¹For further discussion of the concept of participation and its importance in political science,

In summary, the argument is this: two overriding characteristics of rural parties are potential political abuse and a multi-faceted nature. These are in essence countervailing forces. Multi-faceted activities promote individual party participation. Abusive party authority tends to cause the individual to withdraw from party participation. When this occurs, political participation in the broader sense is also nullified; this is because the rural party is one of the few institutions that have communication links between the various upper levels of government and the people. Under these countervailing pressures, the individual pursues one of three courses of action: (1) participation in party activity, (2) non-participation, (3) active resistance to party activity. The continuance in one of these three patterns depends on the satisfaction the individual receives on a wide range of issues of direct interest to him. Intervening factors, such as the individual's expectations, personal links with party leaders in decision-making positions, the actual process by which a conflict situation is resolved, and the time needed to reconcile an issue, will all effect the process of issue satisfaction. They will in turn effect the individual's party participation. Constant pressures exist for the individual to participate. Pressures are exercised directly by local party officials, or indirectly by the propagandizing national leaders. How these processes work may be seen with an analysis of a particular rural party situation.

II. CASE FOR ANALYSIS: TANZANIA

The Rural Party

One of the most impressive efforts to create a party structure that would avoid the local abuse of authority phenomena while integrating the nation politically and mobilizing the people economically has been led by Julius Nyerere of Tanzania. The Tanganyika African National Union (TANU),² the legal single party, has

been particularly successful in penetrating the village areas and establishing viable rural branches in some 7,200 locales. Compared to other African states this is an important accomplishment. In most nations rural parties are election-year phenomena; they become viable organizations only to serve the campaign, nomination, and election functions. TANU's rural organizations operate throughout the year, engaging in many official and semi-official activities which are often geared to aiding the government's local development schemes. The party's rural component is doubly impressive when the obstacles are known. Tanzania is an economically poor nation, generally devoid of mineral wealth, and divided into 120 different ethnic groups.

TANU was founded July 7, 1954, as a nationalist independence movement, evolving in part from the earlier Tanganyika African Association. Although at the outset several of the founders of TANU, including Julius Nyerere, wished to keep the party a compact, elite organization for more concerted action, it gradually took on the dimensions of a mass movement. Since independence in 1961, the party has had the quality of an all-encompassing union, open to any citizen and extending to all sections of the society. At the present time TANU is the single legal party in Tanzania.

Although reorganization and experimentation is constantly going on, the party is basically organized into four tiers below the national headquarters: the regional, district, rural (or local), and cell levels. General policy is set through the National Executive Committee in the capital, interpreted by the regional offices and implemented through the district and rural branches. The district branch is generally coterminous with the 61 administrative districts in Tanzania, and will have within it anywhere from 20 to 300 rural party branches, depending on district size and population. The rural branch usually serves an area designated for local government tax pur-

see Lester W. Milbrath, *Political Participation* (Chicago: Rand McNally, 1965); and Aristide R. Zolberg, *Creating Political Order* (Chicago: Rand McNally, 1966).

² Since the union of Tanganyika and Zanzibar in April, 1964, the United Republic of Tanzania has kept two autonomous political parties, the Afro-Shirazi Party on Zanzibar and TANU on the mainland. For the most important literature on TANU see Henry Bienen, *Tanzania: Party Transformation and Economic Development*, (Princeton: Princeton University Press, 1967). See also George Bennett, "An Outline History of TANU," *Makerere Journal* (No. 7, 1963), 15-

32; and Harvey Glickman, "One Party System in Tanganyika," *The Annals*, 358 (March, 1965), 136-149. For party activity on Zanzibar see Michael F. Lofchie, "Zanzibar," in James S. Coleman and Carl Rosberg, Jr. (eds.), *Political Parties and National Integration in Tropical Africa*, (Berkeley: University of California Press, 1964), 482-511. For literature on the administration and its relation to the party, see William Tordoff, *Government and Politics in Tanzania* (Nairobi: East Africa Publishing House, 1967); and Stanley Dryden, *Local Administration in Tanzania* (Nairobi: East African Publishing House, 1968).

poses as a village.³ Incorporated within each rural branch are the TANU Youth League (TYL), the women's organization (UWT), and in many areas, the TANU elders.⁴ Each of these affiliates has an administrative counterpart at the national, regional, and district levels. The party cell structure is organized below the rural party branch. Cells are made up of 10 homesteads; each family head has specific duties, such as chairman, vice chairman, or the officer in charge of education, agricultural, medical, security, roads and paths, and forests. The cells are organized for education and economic mobilization, but in many areas they carry out security and police functions.⁵

³ In Tanzania, the term village generally means a wide area of dispersed homesteads. There are few concentrated villages as those found in the West.

⁴ The TANU Youth League is usually the most important of the rural affiliates because it serves as a village police force. In most areas members have the right of arrest. They also serve as messengers, official escorts, and general party functionaries. Most TYL are between ages 18-35 and as a group may carry on commercial ventures such as operating a local bar or sponsoring sport or ceremonial activities. In some areas the youth groups have been subject to criticism from party leaders for becoming overzealous, taking the law into their own hands, holding illegal trials and occasionally forcing younger boys to drill with imitation rifles. Changes since the Arusha Declaration (1967) have included other, more politically oriented youth movements such as the Green Guards.

⁵ The administrative organization of the party is more complex than this brief statement suggests. For example, in some districts there are interim branch offices between the district and local branches. In other areas the village development committee (VDC), which ostensibly is a part of the local government apparatus, is often one and the same as the rural party branch. The officers, by government decree, are the same. In the early months of 1970 some village branches were reportedly to be consolidated into new TANU local branch offices which would be coterminous with district council wards. A new TANU constitution in 1965 reorganized the party structure in terms of the working and executive committees, and the annual conference of delegates at each level. Party leaders were empowered to summon witnesses, take evidence, and call for documents. A commission of inquiry was also established which gave citizens a means of airing their grievances against wielders of party and government authority. The commission received some 1627 complaints in 1966-67, some 439 were rejected as out of its jurisdiction,

Rural party organizations have several intrinsic characteristics. They are institutional nerve endings of the national party structure. They are the local institutions by which the people are brought into the national political system and through which the commands of the governing elite are channeled. At the rural level, the government and party functions are largely fused. TANU is the coordinating organization responsible for a wide range of nation-building activities.⁶ While keeping its identity, the party has extended its influence and personnel into most rural organizations, including the more important local administration and semi-governmental marketing cooperatives. The rural party is by nature an authoritative mechanism, operated by local influentials who are able to manage the allocation of scarce resources. In most areas the party is composed of poorly paid enthusiasts who hold other jobs as farmers, drivers, carpenters, and store keepers. Their political actions are only loosely controlled by the higher-level district offices.

Such rural party leaders are able to remain in power for at least three reasons. First, they offer the peasant, who may be in domestic or legal difficulty, the possibility of representing him at higher levels of authority. Second, the party leader is privy to information outside the village area by virtue of his contacts with the party organization. He can, therefore, provide the peasant with specific information, as well as an interpretation of new events. Third, the party leader often controls, or has influence over, the allocation of local jobs and other scarce resources. Such mundane matters as the dispens-

114 were investigated, 54 found justified, and 443 under consideration at the end of 1967. See: *Tanzania, Permanent Commissions on Inquiry: Annual Report, 1966-67* (Dar es Salaam: Government Printer, 1968). Also see a review article on this unique constitutional entity by Robert Martin, *Journal of Modern African Studies*, VII (April, 1969), 178-183.

⁶ With the Arusha Declaration, the party has been charged with implementing the teachings of African Socialism and self-reliance. The party was declared the supreme government institution in Tanzania during the 14th TANU Conference (June, 1969), with the government its instrument in implementing policies. (*East African Standard*, June 9, 1969). See *Tanzania, The Arusha Declaration* (Dar es Salaam: Government Printer, 1967). Also see Julius K. Nyerere, *Freedom and Socialism* (London: Oxford University Press, 1968), and *Ujamaa—Essays on Socialism* (London: Oxford University Press, 1968).

ing of medicines, free transportation, or honorific ceremonial duties, fall within the political arena dictated by a rural party leader.

A key organizational aim of the national party headquarters has been to gain mass involvement in political affairs. To this end a full ideological campaign has been in operation for amplification by the rural branches. From several points of view the results are impressive. Mass participation has occurred in voting, local government councils, marketing cooperatives, and self-held activities. There is general support for party rallies, party slogans, and local mobilization efforts, all of which are usually couched in terms of African socialism. As a coherent ideology, however, African socialism as yet has little meaning in the rural areas. The attending pronouncements on Pan-Africanism are poorly understood and the running anti-imperialism critique is reacted to more on a specific-issue basis than as a part of an on-going ideology. Within the ideology there has been an emphasis on national culture and on the historical uniqueness of Tanzania. African Socialism is referred to by national leaders as the rationale for governmental control of economic institutions. Such statements have meaning in the rural areas only in terms of job opportunities, salaries, and commodity prices. In sum, the parochial nature of the rural party precludes at the present time acceptance or understanding of a unifying national ideology. The ingredients of such parochialism can be seen graphically in the day-to-day activities of a rural party.

The Rural Party's Multi-faceted Activities

The types of activities carried out by rural party branches fall broadly into five classes. First, family and marital mediation is commonplace and includes giving assistance in divorce cases, arbitrating husband-wife disputes, fining wife deserters, and intervening when family heads cannot resolve a problem. Second, village administrative activities are carried out in the writing of reports on local projects, arranging self-help schemes, ordering building materials, and the like. Third, a welfare activity is exemplified in making public announcements, delivering public complaints, and aiding in specific problems such as sanitation or health. Fourth, a form of police activity is seen in protecting private property, warning troublemakers, investigating, and sending individuals to court. Fifth, the party serves as social critic in chastizing unpatriotic behavior, in condemning certain acts, or in encouraging compliance in such matters as school attendance and tax payment. Concrete examples of these activities are

seen in forty messages transmitted *to*, and received *from*, a typical rural party (Table 1).

The party activities reflected in the messages are varied and far-reaching. They tell us a good deal about TANU and allow for several points of analysis. First, it is obvious that TANU leaders perform nearly all authoritative acts that can be initiated within the limits of the rural political system. The party itself becomes a catch-all organization, its leaders acting as counselors, guides, father-confessors, investigators, and judges. The leaders reprimand and chastise, cajole and announce. They become personally involved in the full range of personal problems. Love quarrels, family feuds, and house-burnings are within their domain. Moral issues and money issues are common concerns. In terms of conflict resolution, party leaders provide a "safety valve" for community tensions by allowing individuals to transfer problems and complaints to them. Direct personal confrontations in many cases are thereby avoided.

Second, there are few guidelines to the leaders' legitimate areas of operation. In reality the party operates in all sectors in which the local chairman or other leaders wish to become involved. Formal authority channels are not recognized, and a leader will delve into administrative or legal matters if he feels he has a sympathetic audience. Nor is there a clear-cut pattern of when an individual will take a problem to a party official in lieu of a former traditional headman, although customary law disputes usually begin with mediation by the traditional headman.⁷ Authority is constantly being tested as party leaders try to win support and either succeed or are rebuffed. Other village leaders in more traditional positions such as former chiefs or headmen hesitate to test their long-established authority for fear that new conditions may have undermined their authority. Instead, they spend a great deal of effort in simply negating the party leaders who are attempting to take initiative.

Third, the messages give an indication of the rural people's attitude to the party. TANU is viewed much like a parental authority. Individ-

⁷ Although traditional chiefs, sub-chiefs, and headmen were officially removed from power in 1963, many were able to retain influence by taking party or administrative jobs. Other traditional leaders relied on their religious-magical, ritual, and customary law functions to retain local influence. A headman usually presided over what is now designated as a village. See Norman N. Miller, "Political Survival of Traditional Leadership," *Journal of Modern African Studies*, VI (July, 1968), 183-201.

uals send greetings to the party, beg the party's forgiveness, and wish to stay on good terms with party leaders. There is little questioning of higher authority and usually there is compliance with a direct order. Such attitudes undoubtedly spring from fear of what the party leaders can do as public prosecutors, and as public informants. The authoritative nature of the tradi-

tional political system conditioned such attitudes.⁸ The backing the government now gives the

⁸Based mainly on the institution of chieftaincy, the traditional political system in its purest form would be equated with pre-European administration (Tanzania, 1890). Remnants from the traditional system persist into the present period. Both

TABLE 1. A RURAL PARTY'S COMMUNICATIONS*

<i>Content of Incoming Messages</i>	<i>Result**</i>
1. Old woman asks TANU's help in getting divorce certificate	Referred to local court
2. Bar owner reports quarrel and requests investigation	No action
3. Woman complains of husband's mistreatment	Letter sent to husband ordering him to improve his behavior
4. Farmer requests vote for local representative to district council be secret and that a box in a private room be used	Party promises to study the request
5. Old man confesses, after a hearing, that he failed to tend his sick wife, who has since recovered and left him	Party fines man 40 shillings and instructs him to pay his wife an additional 5 shillings; wife agrees to return home
6. Local government officer requests forms be completed which give composition of village development committee	Forms completed
7. Village medical officer complains of "great water shortage" at clinic and asks for help	Public water brigade formed
8. Young woman complains a man (named) has repeatedly accosted her in her hut	Party chairman warns man to improve his behavior
9. Farmer complains someone has set his hut on fire, and requests an investigation	Found to be caused by a field fire out of control
10. Teacher complains five children (named) are not attending primary school	Party chairman warns parents
11. Local government officer requests party chairman inspect an individual's house who is suspected of practicing witchcraft, and to look for specific medicines and poisons	Chairman investigates with three other party leaders; suspect banished, but order later rescinded
12. Shopkeeper asks party chairman to remind farmer of debt for kerosene and cloth	Farmer ordered to pay
13. Old woman writes to party chairman: "I am sending my bed on top of the bus and do not trust the bus driver. Please see the bed is put off at the house of Hamud Shams."	Problems given to TANU Youth League
14. Local government officer notes that all teachers are encouraged to stand for local election	Notice posted
15. Farmer writes: "This letter is just to say Salaam (Peace) . . . Salaam, that is all."	No action
16. Local government officer gives procedure for elections, and stresses need for peaceful voting	Announcement made
17. Divorced woman agrees to stop "misbehavior" in the maize fields, and begs party's forgiveness	No comment
18. Farmer informs TANU that his case against a named individual, and his dog, has been settled without trial. Farmer was bitten on ear while "resting" on beer-hall floor	10 shilling settlement

TABLE 1. (continued)

<i>Content of Incoming Messages</i>	<i>Result**</i>
19. Beer-making license requested for local farmer from local government official	Granted
20. Announcement of TANU parade to open new dispensary	Announcement posted
21. Woman is accused by TANU in theft of 89 shillings (12.70)	Referred to court
23. Gift to be given people when new dispensary is officially opened	Large clock presented by party official
24. Village beer sale hours are weekends 3-7 p.m. only	Posted
25. Legal action threatened those who failed to take part in self-help project to repair road	No action taken
26. Agenda announced for next party meeting to include local bus problems, building grass roof for school, and new clinic annex	Agenda sent to 20 party leaders
27. Man given receipt for his bicycle, confiscated when Youth League caught him riding without brakes	Claims he needs no brakes; action deferred
28. Two men charged in court for failing to work on community self-help scheme	Released by agreement with party leaders
29. Complaint sent to district headquarters that local bus runs infrequently, passes many who wish to ride, is too small, and is very dirty	No action
30. Youth League ordered to stop threatening violence	Request acknowledged
31. Chairman seeks job for villager in local government administration	No action
32. Announcement made that party leaders and Village Development Committee (VDC) members must have proof of paid-up tax	Circulated and posted
33. Public notice is made that the new TANU office is open.	Posted
34. Man who harvested and ate another man's crops is charged and sent for trial	Trial results not known
35. Divorced woman told 100 shilling bride-price must be returned to her former husband	Woman refers party leader to her father who received the money
36. Complaint to the cooperative union that crop prices are far too low	Complaint not acknowledged
37. Public collections for independence day celebrations will be one shilling per man	Announced
38. Citizens ordered to bring tools, rope, poles, and grass to build new clinic annex, or pay one shilling fine	Building completed
39. Man who used abusive language against TANU secretary is charged in local court	Paid 10 shillings fine
40. Letter to all citizens: "Warning, keep the peace during independence-day celebrations"	Circulated and posted

** Messages written by party chairman or secretary, on behalf of the party.

rural party allows the modern leader unlimited

German and British administrators relied on chiefs for indirect rule, and although chiefs were often appointed, in lieu of hereditary claimants, their local authority was considerable in terms of law, tax collections, and ritual. *Ibid.*, pp. 188-196.

possibilities to exercise influence. The leader's role is increasingly proliferated.

Fourth, the party performs general police functions such as investigations, arrests, formal court charges, trials, fines, confinements, and property confiscations. The opportunity for party activities of this nature exists because in

most rural areas there are no police or formal trial structures immediately available. Trails are held by the party because the approximately 600 primary, or local, courts are spread so thinly over Tanzania that it is a major undertaking to use them. The party fills the void as the most authoritative organization operating in immediate contact with the people. In dealing directly with the people, party leaders are occasionally coercive. The messages substantiate this, particularly if a dichotomy is drawn between messages which reflect voluntary behavior, and those reflecting that which has been forced by party leaders. From this point of view, nineteen of the forty messages may be considered coercive or enforcing. Another six cases are mildly enforcing. On the other hand, fifteen cases deal with situations where coercion is not involved.⁹ As the messages indicate, TANU Youth League members carry out most of the police functions, and much of the coercion comes through this organization.

Fifth, rural party activities are supportive of broader government modernization goals in the sense that they generally enhance village solidarity, help to settle disputes, promote cohesion, build consensus, and aid communications. Activities which would have the *opposite* effects could be argued to negate modernization programs. Assessed in these terms witchcraft allegations, unwarranted party threats, or unfair arrests which cause withdrawal from self-help schemes would be included. Only four of the messages fall into these categories, suggesting that the party is usually a positive modernizing agent.¹⁰

Potential Abuse of Party Authority

Misuse of party authority occurs because most peasants are not aware of the limits national party leaders have placed on local leaders. In part this is because such regulations have been in effect a relatively short time. In the traditional political system, and the colonial system, the general limits on the main authority—the local chief—were known because they had evolved over time. Historically, there was little chance of flagrant abuse of powers because checks on the chief existed in the form of withdrawal from the chieftdom, or if necessary, violent dethronement by armed attack or assassination. In the modern period, the only recourse for the individual who becomes disenchanted with

the local political process is to oppose the process or to withdraw from it. The latter is in essence non-participation. In a political sense it is usually caused by alienation from local party leaders who have committed some abuse of power which has directly affected the individual.

It is important to note that when a rural party leader abuses his powers, it is an abuse of the national party regulations set down and defined by national leaders. It is in the application of party policy at the district and village level that individual misconduct occurs and rights are abused.¹¹ The criticisms leveled at rural leaders by national officials are broadly of four types.

First, local party officers are chided for their treatment of Asian traders who control a large sector of commerce. Local party leaders argue that the Asian has traditionally exploited the people, that most do not have Tanzanian citizenship and are probably not going to remain in the country. It is further argued that the Asians have made great wealth at the expense of the Africans and should be expected to contribute funds and take an active part in party projects. Tensions are also increased by the Asians' exclusiveness, and rumors of some merchants leaving the country with great wealth made at the expense of the African. Asians feel that local party leaders maltreat them: credit is demanded, bills not paid, financial contributions requested, shops closed for endless ceremonies, and shop-owners forced to work on self-help schemes. The result is to entrench Asian entrepreneurs in the towns, and to make them economically inter-reliant.

Second, the local party is criticized for financial irresponsibility. This usually takes the form of petty theft by minor officials, misuse and loss of party funds, unpaid debts, or inefficient record keeping. Higher level party leaders point to the increased spot-check and audit procedures and realistically argue that it is impossible to keep tight control on the remote rural branches. Nevertheless, villagers often mistrust local leaders and refuse to contribute financial support.

A further criticism involves attempts to force participation in party activities. Peasant refusal to pay fees, attend meetings, or take problems to the party often leads to accusations of disloyalty to the nation, and to harsh collection campaigns. The contrast between the current lack of participation in some rural areas, with the strong involvement the same area exhibited in the pre-independence, nationalistic period, causes local

⁹ Those messages classified as indicating coercive pressure were 3, 5, 6, 8, 10, 11, 13, 18, 21, 22, 24, 25, 27, 28, 30, 34, 35, 38, 39; mildly coercive: 15, 17, 20, 32, 37, 40; non-coercive: all others.

¹⁰ Messages 11, 28, 30, 39.

¹¹ The Permanent Commission of Inquiry was established essentially to hear such abuses. *Tanzania, The Permanent Commission, op. cit.*

TABLE 2. INCIDENTS INVOLVING MISUSE OF PARTY AUTHORITY*

Incident	Result
1. Rural party leader intimidates local court magistrate by insisting he find an individual guilty who allegedly spoke against the party	Magistrate requests guidance from District court officials and incident is referred to higher authority
2. Man is either murdered or commits suicide (hanged). Rural party officials force family to bury body without inquest or police report	Rumor reaches police post, inquest ordered, rural leaders criticized
3. Rural branch holds "court" and fines individuals who do not cooperate with the party	Rural leaders reprimanded by district party officials
4. Rural chairman holds second job as bus driver. On several occasions he halts bus and collects license fees from passing bicyclists, but fails to turn in money to local government clerk	Police investigation requested
5. Leaders of Muslim welfare society claim party leaders used discriminatory tactics and abuse Islam followers in public meetings	Complaint sent to district party office; No action
6. Rural chairman controls rental of TANU-owned tractor. He charges exorbitant fees to some farmers, and allows his father, brother and father-in-law to use tractor without charge	Complaint to district party office causes tractor to be sent to another village
7. Agriculture extension worker threatened with beating for allegedly telling farmers not to join TANU or pay party fees	District party officer hears of threat, warns local branch, and complains to Agriculture department
8. Rural party chairman conducts membership campaign by forcing all farmers who wish to ride local buses or enter clinic to buy party membership card.	Chairman relieved of duties and incident referred to as an abuse of powers
9. Meeting at headman's house to resolve husband-wife dispute is broken up by party chairman. He dismisses husband and forces wife to return to his home where he allegedly accosts her	Chairman relieved of duties by district TANU officials and criticized for using party name as his authority; local court case brought by irate husband
10. Asian store owner complains of mistreatment by party leaders who demand contributions, impose store hours, and force road work	Complaint sent to regional party office; No action
11. Hospital staff complains of impromptu "investigation" by local party officials who threaten staff for being "inefficient, drunken, and mistreating patients"	District party officer promises to investigate problem
12. Prosperous bee-keeping cooperative accuses party of controlling their marketing procedures and of engaging in profiteering	After two-year delay regional office settles issue in favor of cooperative
13. Rural office demands and receives credit from local merchant for \$478; refuses to settle account	Merchant complains to regional party office; no action
14. Five village-level local government employees (ADEO's) forced out of jobs by the party and "TANU men" put in their places	Administration complains to regional party headquarters of unfair pressure which undermines efficiency; no corrective action taken
15. Audit of rural branch shows cash shortage, no control of membership cards, no cash box, and loss of President's picture	Rural chairman warned to discharge duties in accord with regulations

*Source: Survey of eight rural party organizations in Tabora District, Tanzania. Data based on interviews with party leaders, local government officers, district administrators, and a survey of administrative files of Tabora District Administration, 1964-66, 1968. The cases are not reflective of specific individuals or leadership positions.

leaders to intensify their campaigns. Their justification is that better participation in the past has been forthcoming. The result, however, is often only to elicit minimal tolerance of the party, lip-service to its aims, and little tangible support.

Fourth, the broadest form of criticism leveled at rural leaders involves their misconduct for personal gain, carried out in the name of the party. Financial gain, status rewards, or self-aggrandizement may be sought by using a party position in a coercive manner. Such situations are often characterized by a powerful, local individual exerting personal authority; the fact that he is a TANU leader is incidental to the fact that he has a strong personal base of authority.¹² The misuse of this authority may involve forced payment, illegal trials, threats of violence, temporary imprisonment, and outright extortion. When such incidents come to light, higher level party authorities are quick to counter them. The corrective action, however, in some cases taken by the Permanent Commissioner of Inquiry, does not nullify the incident's effect on the rural people. Withdrawal from any form of political participation is often the result.

Specific case-level examples of the misuse of rural party authority will illustrate the problems faced by national leaders in gaining local support for the party and participation in its activities. It should be emphasized that such incidents are precisely the basis upon which the national leadership criticizes rural officials.

Analysis of the incidents supports the initial departure point that party abuse occurs most often in rural areas where local branch leaders can use their party for a personal authority base, but where party rules are not yet operating. Party activities at the district level and above are usually rational and actions are usually taken for the best interest of the farmer. At the rural level, party activities are often the result of individual initiative and may be irrational. There are several reasons for such behavior by a rural leader. Rural leaders act as free agents a majority of the time, and there are no close checks on their activities by superiors. Rural leaders have little fear of loss of position because they are not paid well enough to make the positions highly prized. There are no clearcut ideas among rural people of what a party

leader's job is, or what the role involves. Such ambiguity allows the leader to reshape the job to his own ends. Viewed from the farmer's vantage point an abuse is individualistic. It is not so much TANU which is causing the difficulty, but a well-known individual who is incidentally the TANU leader; a man who, the farmer vaguely realizes, has gained some authority over him.

Policy ambiguity also exists. Much of all party business is a reaction to some event. Each level above the village has a corrective function; wrongs are set right by decree from higher party officials and usually on an *ad hoc* basis. There is little evidence that a formal policy is pursued or that a series of mistakes helps to establish a policy that is followed in the rural areas. More often rumor or gossip about an incident will set the guidelines of policy as a farmer understands them. The reported experience of a particular individual carries more weight than a formal statement, announcement, or circular.

III. FORMS OF PARTY PARTICIPATION

Findings on the behavior of individuals in rural party situations suggest that participation in the party takes one of three forms.

Active Participation: Under these conditions the individual is actively involved in the party process. He accepts most of the party rules as they are interpreted to him, helps enforce such rules, and generally does so on a voluntary basis. His compliance with the system indicates his general support of the political process, although he may differ on specific issues directly affecting him. His continued support of the party will depend on the satisfaction he gets from his party activities, and the decisions made on his behalf by party officials.

The extent of active participation, the reasons for taking part in party activities, and questions related to the process of active participation may be seen in survey data concerning rural party leaders and randomly selected farmers collected in three widely separated districts.¹³

Satisfaction with Party: Participation in the party may also be seen in terms of a *satisfaction expected*¹⁴ and *satisfaction received* ratio.¹⁵ The

¹³ For details of the sample survey, see the Appendix.

¹² The Arusha Declaration and subsequent pressures by Julius Nyerere have been aimed at keeping party and government officials from making personal gain by virtue of their positions. The efforts have been more successful on the national and regional levels, than with the isolated rural leadership.

¹⁴ Regarding satisfaction expected, an important parenthetical question is what is the rural party's ability to actually satisfy expectations. In most areas the local party leaders are increasingly able to control resources. The party has been declared the supreme governing body of the nation and the national party propaganda gives local leaders and cell chairmen continuous support and legitimacy.

responses to the question "What does the party do for the people?" indicate a general satisfaction with the party. Only 1.3% reported negative attitudes. The findings also support the general thesis that the party is a multi-faceted organization that engages in a wide range of activities.

TABLE 3. WHAT DOES THE PARTY DO FOR THE PEOPLE?

29%	Party leads economic development projects.
18	Party is the government; administers, maintains law and order, governs the people.
14	Party unifies the people, promotes cooperation, ends colonialism.
12	Party is the representative of the people, voice of the people, interpreter of government policy, voice of the government.
12	Party is an educator. Party teaches political ideas, agricultural methods, health and welfare improvements.
1	Party is a negative influence.
14	Other.
100%	
(N = 434)	

The question "whom do you go to when you have a political problem?" also gives an indication of the satisfaction with the party. Over 70% of the respondents stated they took their problems either to the chairman of the party cell (42%) or to the chairman of the village party branch (19%). Some 10% stated they would take their political problem to a local government officer. Less than 2% stated they would seek satisfaction on a political problem from a traditional leader (headman, subchief). About 22% failed to answer the question. The findings indicate an overall satisfaction with the party as an agent for settling disputes and problems. The figures, however, probably underestimate the importance of the family head and the traditional leader in the settlement of problems. My observations indicate that people go to the political party office with problems that have been already judged—perhaps unsatisfactorily—by

The result is party control over such basic resources as new jobs, local wages, access to some schooling, appointment to honorific positions, access to important meetings, free transportation, and the like.

¹⁵ Other approaches to analyzing participation such as formal-informal, and leader-follower typologies or the comparing of relative degrees of commitment to various roles, are considered less appropriate for an African rural party setting.

family heads. The same people may have gone to a traditional leader for interpretation and mediation. However, the only "proper" channels of settlement would be through the party, the government agents or the courts; traditional leaders are officially out of power. Our interviews indicate that peasants are aware of political realities, but the figures fail to reflect the *de facto* power of traditional authorities.¹⁶

Party Membership. Active party participation is indicated in questions concerning party membership. About 92% claim to be members of the party (at one time), and about 61% state they joined when first asked. Some 16% admitted to waiting for several months to join. Over a third of the respondents said they actively volunteered for party membership and another 25% said they joined because they were approached directly by a party official. Most members claim to have joined the party prior to independence (1961), and nearly 40% claim to have joined the party in the early years of its activity (1954-57).¹⁷

When asked why they joined the party, over half of the respondents said to "fight for independence" or to "get rid of the colonials." Some 10% joined because they saw the party as an organization to help build national unity and to develop the country economically. Some 8% reported they joined TANU under somewhat coercive conditions.

Other indicators of basic support and participation in the party activities are reflected in the nearly 50% of the respondents who knew the name of the leading political party leader in the district (Area Commissioner). Only slightly fewer knew the provincial political party leader (Regional Commissioner). In response to the opinion question: "Do you agree or disagree that political matters should be left to government officials and village people should not become involved," a total of 87% of the respondents disagreed. The finding indicates a strong feeling among farmers that they at least "should" be involved in local political affairs.

The extent of party activity is also seen in what the respondents believe to be the purpose of the party cell system (10-house cells).

¹⁶ Indicating the problem of getting totally candid responses from farmers on government matters. There is good reason to believe farmers are guarded in an interview situation and are less critical of the government in an interview than they are in their day-to-day exchanges.

¹⁷ Observations indicate the figures are high; farmers are inclined to falsely claim membership or to claim current membership if annual dues were paid in any one year.

Officially, the purpose is to educate farmers to new agricultural techniques, to bring together the 10-house *families* for cooperative purposes, and to provide a local cell chairman for the settlements of disputes. Villagers however ascribe far wider purposes to the party cell system.

TABLE 4. WHAT IS THE PURPOSE OF THE 10-HOUSE PARTY CELL?

12%	To provide police functions, to detect criminals, to observe newcomers, to report suspicious activities, to prevent crime.
8	To settle disputes and to judge cases.
8	To collect taxes.
11	To promote cooperation in communal work.
15	To bring about economic progress in agriculture.
15	To disseminate news and propaganda.
10	To aid government administration.
3	To aid the party.
9	Doesn't know.
9	Other/omitted.
100%	
(N = 434)	

Non-participation: In addition to our basic assumption that individual abuse causes withdrawal of support from the party, non-participation can occur for at least three other reasons. First, if individuals perceive that the party leaders cannot make authoritative decisions that resolve local conflicts, a shift to stronger authority figures such as traditional leaders or administrative leaders will occur. Second, unwanted party decrees or excessive demands can cause a group of individuals to pay lip service to the party, and at the same time, to withdraw from it. This is often done by villagers supporting a non-local, alien individual as a party chairman, and using him as a buffer against the unwanted decrees from the district party office. When the lack of participation is noted by higher officials, it is the tribally alien party chairman who is criticized, not the individual farmer. In essence the alien leader lacks kinship ties and other levers to effectively gain local support.

Third, the individual's realization that rural party officials do not have an economic base to their authority, such as controlling land usage, dictating job opportunities, allocating free transportation, and the like, will cause farmers to shift their support to leaders in the local administration or the marketing cooperative who do have economic influence. Shifting allegiances are particularly likely to occur if the administrative grid in a given district is weak. The strength of

the local administration varies graphically throughout Tanzania.

Specific data concerning non-participation is seen in the survey findings and in the statements made by both regional and local party officials. The most significant findings were:

Nearly 75% of the respondents had never had written communication with the party. About 8% had sent one or two letters during the year and another 8% had done so more than three times.

When asked why they joined the party about 6% gave answers indicating they had joined under some pressure, and would not be active participants. Such answers included "I was forced," "I followed others under pressure," "I had no other choice," or "my employer 'encouraged' me to join."

When asked what is the line of authority for settling disputes beyond the village level, 72% refused to express an answer—indicating a basic desire not to be committed to an authority system beyond their immediate neighborhood. Some 13% indicated they would follow the village-district-regional party system, the remainder indicated a mixing of party, local government and traditional authorities.

Although the majority of the respondents felt that the party had done something positive for the village, those who expressed dissenting opinions (about 2%) did so for the following reasons: "party leaders do nothing for the people," "they are destructive and self-seeking," or "they demand money."

Although the findings shed some light on why non-participation in party activities occurs, they must be interpreted in light of other field observations. The survey findings on written, formal communication with the party, for example, indicate there is little overall communication. In fact, there is a great deal of informal discussion with party leaders. Written communication is initiated in extreme circumstances, when party leaders indicate a message is needed, or when distance separates the individuals. The difficulty in getting letters written and the shortage of public scribes hinders written communication. The findings on the reasons to join the party, and on what the government and the party had done for the village, also need amplification. Indications are that the people are more critical than the figures indicate. The fear of giving open opinions, and the distrust of the interview situation, would lead the respondent to give "safe" political answers. In fact most peasant farmers keep up a running criticism of the gov-

ernment for failing to provide more for the village. In the eyes of the farmers there is usually no differentiation between the party and the government beyond the local leaders that are known on a face-to-face basis.

The lack of participation in some rural party branches is also a recurring theme among party officials above the village level. The usual criticism is that the rural branch is not active enough, that the people do not regard the party as an organization to solve their problems, and that the party is not "speaking for the people." Relations between local government officials and rural party officials are often strained. The result is a lack of support for the rural party branch by the local administration.¹⁸

Comments from rural party leaders in Central Tanzania indicate the general problem.¹⁹

Party chairman Itaga village: "... progress here is slow due to misunderstandings between TANU and local government officers ... people receive different orders from these leaders. ... Most are not paying their monthly fees. The party hardly gets any new members."

Party chairman Uyui village: "... people have stopped coming to TANU to report their difficulties and troubles ... they go straight to the local government employees. ..."

Party chairman Uyowa village: "I hardly collect any monthly fees as they don't value the office now. ..."

Party chairman Upuge village: "... before (pre-independence) many people joined and fees were paid by most of this chiefdom. TANU offices were always full of people with troubles. Some were settled and some referred to court. After independence (1961) TANU has been dropping down ... people don't attend meetings even when they are told to do so. ..."

On balance, non-participation is gauged by rural leaders in terms of fees paid, the use of TANU for problem settlement, and the general traffic in the TANU office. The higher levels of authority were equally concerned with the same problems and also with questions of respect for

the party, and the broader organizational questions of the party's relations with local and central government organizations.

Dissatisfaction with the party as an agent and partner of the national government is seen in responses to the question "What has the government done for the people of this village?" Over 40% of the respondents stated the government had done nothing for the village. Another 10% didn't know of any contribution, or refused to answer the question. Other responses include specific contributions as "provided tools and material goods" (10%), "provided administrative help" (7%), "financed an agricultural or construction project" (14%), "financed an education project" (8%), or "provided freedom and independence" (3%). Only 3% said the government had done a great deal for the village, or gave details of several contributions.

A further indication of dissatisfaction that would lead to an individual's failure to participate in party activities is seen in the responses to the question: "Do you agree or disagree that government matters and politics are so complicated that the average man cannot really understand what is going on?" Nearly 75% of the sample agreed with this statement, 18% disagreed, and 2% were uncertain. The remainder did not answer the question. Overall, the findings indicate a widespread dissatisfaction with the "outside party" and the "outside government." This finding also lends credence to the suggestion that peasants see the government as remote, disinterested, and ineffectual within their village.

Satisfaction is, of course, conditioned by peasant *expectations*. On the one hand, peasants expect the government to aid them and are annoyed and dissatisfied when this does not occur. On the other hand, the general cynicism reflected in the responses to the survey questions indicates a general expectation of abuse and maltreatment. Most peasants expect leaders to be self-seeking and to engage in petty theft. There is a general feeling that any man who gets into a high-level job will exploit the situation.²⁰ These attitudes are coupled with a broader belief in the inevitability of ill-fortune. Conditioned initially by the harsh life style, the expect-

¹⁸ The above specific criticisms were leveled against rural party leaders by the then Regional Commissioner for Tabora, R. S. Wambura in "TANU and the Government" (Tabora: District Council Pamphlet, 1963, cyclostyled). The comments are indicative of similar problems in many areas of Tanzania.

¹⁹ Selected as representative comments from a survey of rural party organizations in Tabora district, 1965-66 and 1968.

²⁰ In the general elections of 1965, the voters' expectation that many of the incumbents had gotten rich in office led them to vote the man out of office on the basis that another man should have a chance at wealth. See Bismark Mwansasu and Norman N. Miller, "The Fall of a Minister," in Lionel Cliffe (ed.), *One-Party Democracy* (Nairobi: East African Publishing House, 1967).

tation of ill-fortune extends into the political arena. Maltreatment, for example, is expected if one ventures outside the face-to-face world and deals with a distant people or government.

Other peasant attitudes illustrate the relationship between satisfaction and expectation. Approximately 64% of the respondents expected to stay in their village the rest of their lives and only 14% were willing to say definitely that they would leave their village. When asked "What job would you do if you could change your work," over 50% indicated no change was desired. Approximately 12% indicated they would simply improve their present work, and another 11% indicated they would return to farming from their present type of work. Only two respondents (0.46%) indicated they would move to a political party job, and less than 6% indicated preference for government administrative posts. Jobs such as carpenters, drivers, shop-owners, traders, and positions in the police and the army accounted for less than 8% of the total. A similar question, "What would you like to be doing 5 years from now?" showed that 68% of the respondents expected no change or simply hoped for an improvement in their farming work. When asked "How much money do you expect to make in 5 years, per year," 47% didn't know and an additional 7% expected to make less than 100 shillings (\$14.00) per year.

In essence, satisfaction on personal issues may be impossible for some peasants because they are apathetic, because their expectation levels are unreal, or because they negate the party process by refusing to believe it will serve them and by refusing to participate in it. Seen in this perspective, it is understandable that mild dissatisfaction with the party—and non-participation in its activities—would be in line with the larger dissatisfaction with one's life style. For most individuals, such a situation usually leads more to apathy, disinterest and acceptance of the status quo. In extreme cases of dissatisfaction, active resistance to the party could also result.

Active Resistance: Under these conditions either coercion by party leaders has caused withdrawal from party activities and the individual is actively resisting party leaders, or an organization outside the party sphere has brought pressure on the individual to oppose party activities. The party rules and codes are broken and an attempt is made to either destroy the rural party organization, or to unseat its leaders. Rural party leaders in turn may react by lashing out against the individuals involved, or by calling on higher party authority. When knowledge of anti-party resistance reaches the district or re-

gional party authorities, prompt action is usually taken, either in the form of investigation and rebuke, or when necessary, containment by the police or the field force.

Resistance to party leaders may be mixed with general resistance to government activities. Such a situation usually springs from one of two sources. First, resistance to a specific demand or decree; in essence a collective refusal to follow party leadership for a specific reason which can easily become generalized to a refusal to follow party leadership on any issue. Second, resistance may spring from historical animosity. Groups that were at one time out of the party, such as former chiefs, Muslim organizations, or labor groups, are currently included in the broad party structure. Old antagonisms and old rivalries, however, create factions within the party which on the local level can lead to overt resistance to the existing leadership.

Examples of active resistance take several forms. The refusal to pay TANU dues or local taxes, and the stoning of Land Rovers when officials come to collect (Rungwe District); The refusal to support party or local government leaders to the extent that the President denounces the people as *wadui* or enemy of the state, (Kisarawe District); The attack on a TANU office by a dissident group, who after seizing the files and record books of the party, claim to be the new party leaders, in fact claiming legitimacy in symbols (Tabora District), are all indicative. Most cases of resistance are directed at the local leadership. There is little indication that organized wide-scale disenchantment exists with the national party organization, as was the case in Ghana the latter years of the CPP. Cases usually erupt spontaneously, are resolved, and generally have no implications beyond the village area. Leaders of the dissident groups generally find no support for continued active resistance and they slip back into an ongoing pattern of non-participation in party activities.

IV. FACTORS AFFECTING PARTY PARTICIPATION

In addition to the forms of party activity, four other questions must be analyzed for an understanding of rural party participation. First, what is the context of political life in which rural party participation takes place; second, what are the processes by which issues are resolved for the individual by party authorities; third, what are the links between village and national party organizations that effect peasant participation; and fourth, what are the broader implications for national leaders concerning the political participation of rural peoples.

Context of Political Life

A rural society is often a pedestrian society. There are limited means of transport, the peasant is largely immobilized, and movement to the outside is a major undertaking. The distance a man can easily walk to have a dispute settled or to gain assistance from a higher authority is the effective boundary of village political systems. For most rural individuals the world is in essence a microcosm with the village as the center. Attitudes toward movement are dictated by the relative magnetism of the home village versus the attraction of the outside world.

Political relations are based on kinship ties, clan membership, and the face-to-face, day-by-day interaction with familiar people. Locale, the neighborhood or chiefdom boundaries, and the dictates of an agrarian society heavily influence political life. The planting and harvesting cycle directly affects political considerations. Litigation diminishes during harvests; ritual and ceremony to resolve conflicts increase during planting. Flood, draught, or other natural calamities may cause a revival of traditional sorcery or witchcraft beliefs. Such beliefs provide causal explanations and serve as mechanisms of social control. In turn, witch cleansing, witch trials and banishment may occur with the full involvement of the local political leadership.

Three leadership groups tend to operate in the rural context, and to vie for political power. These include party functionaries such as chairmen, vice chairmen, secretaries, and officers in the youth league, women's group, TANU elders, and the cells. Administrative leaders such as resident local government officers, clerks, teachers and members of a central government ministry posted in the village, such as dispensers, agricultural instructors, forest guards, and game wardens comprise the second group. The third leadership group is composed of traditional leaders such as the former chiefs and headmen, secret society leaders, diviners, prophets, ritualists and soothsayers. The three groups together comprise the political leadership on nearly all issues. In most cases the administrative leaders have less local legitimacy and mainly serve the technical and clerical functions. Party leaders tend to serve mobilization and propaganda functions, and traditional leaders serve mainly to mediate, explain and translate demands made on the peasants.

The most important structures operating within this political context are the rural party and party cells, the village council (Village Development Committee), the marketing cooperatives, and voluntary associations such as parent-

teacher groups, welfare societies, dance groups, and in some areas, secret societies. If the village serves as communications center for out-lying areas, it may also include a primary court, and a local government divisional headquarters. Other local structures often involved in political activities include the local stores and markets, primary schools, tea houses, beer-shops, dispensaries, and mosques or mission stations.

The relationship between these structures at the rural level is characterized by overlapping leadership, a great deal of economic interaction, and communication linkages based on the informal village network, and rumor diffusion. The Village Development Committees (VDC) usually have 20 members who represent sections of the dispersed village area, as well as specific positions (teacher, dispenser); the party chairman is the VDC chairman, and members of the VDC are likely to include the leaders of the marketing cooperative, the local administration, and other organizations. Meetings are open to any individual with complaints or problems. Rural party functionaries are usually members of other social and economic structures and business tends to be transacted informally. Roles tend to be fused. This is not the case for relationships between the party and other organizations at the district, regional and national level. These relations are formalized by written contract and letter, although overlapping leadership exists among the national elite.

Process of Issue Satisfaction

The various survey findings give a picture of what issues are taken to the party. In fact, any potential conflict situation can become a party issue. There are no hard rules, and no precedents are followed except for the interests of the peasant who initiates the incident. He, as noted, will take the issue where he has the best chance of satisfaction. This is conditioned by his view of who is the most authoritative figure in his political arena—and, of these individuals, who would receive his request with the greatest sympathy. It is in part the peasant's view of the relative balance of power between a few local influentials. Since traditional authorities have been severely curtailed in their legal exercise of power, and since government administrators often lack legitimacy in the village areas, the most potentially useful leaders for the peasant are often party functionaries. However, the peasant is usually the initiator of the resolution process and the arena he chooses will depend on where he believes he can get the greatest satisfaction. He may demand, for example, that both traditional and administrative authorities have some

voice when party officials are judging his case. Essentially, then, party participation is based on how satisfied the individual peasant continues to be with a number of issues taken to the party. The peasant is in fact a political chameleon. The situation can change with the issue at stake.

The actual grass-roots process by which a peasant's grievance would be resolved through the party is basically as follows. When a conflict between individuals or groups arises, the issue is either taken by them to the party authority, or the party authority hears of it informally through the neighborhood communication network. If he hears of it informally he may either intervene on his own or do nothing. If the issue is taken to him he usually will either take action on his own, or, after hearing the particulars, call for a broader "public" meeting of other party influentials and elders. Such a public call has two consequences. It brings the issue up to the level of neighborhood knowledge and permits anyone who is interested to participate in the debate. Second, as the messages go out to convene the meeting, the time lag gives the leader an opportunity to consider the problem, to put it in perspective with similar issues, and to debate it informally with others.

When the public meeting begins, the limits of discussion may be framed by a few key leaders, but debate is generally open and evidence may be volunteered from the family, friends, or neighbors of the disputants. Evidence may also be called for by the party leaders and be given either by a specific individual, or in "Greek chorus" fashion. The latter technique also serves to test the feeling of the community at large. If the chorus is not largely unanimous, and there is in fact a counter chorus, the issue divides the community, and the leaders proceed more cautiously. This slower, more laborious process is tedious and has the effect of eventually driving away all those who do not have a vital stake in the issue.

Leadership under these circumstances is generalized; no single party individual dominates. When a consensus is sensed by a few of the leaders, this fact is noted. The decision will then be framed by one or two leaders and usually delivered by the "convening authority." To give the decision legitimacy, the pronouncement may be in the name of the party, in the name of the government, or occasionally in the name of a chiefdom or traditional authority. In most cases the finding would be accompanied by a threat of harsher punishment if the decision of the group is not carried out. Punishment might include a beating, a fine, or banishment from the village. The right of appeal to a higher authority would probably not be noted or discussed.

Links Between Village and National Party

The Tanzania party structure is organized to incorporate the village party officials under the administrative direction of a district branch which is usually headquartered in one of the sixty-one district capitals. The effective linkage between the village and the outside world is in this district-village connection. Although communications from the national and regional offices supposedly filter down to the village through the district offices, the district-village tie is the weakest link in the party structure.²¹ Communications are often non-existent, and requests are often misunderstood or unheeded. Guidelines from the district headquarters on how village leaders should deal with various problems are followed at the whim of the local leader. The immobilized and remote nature of the country creates a situation in which party authority is essentially "Land Rover" authority. District officials come to the village, confer with local leaders, settle problems, and depart. The circuit-riding nature of the system in fact only offers temporary solutions to village problems.

Because of the infrequency of the visits from district officials, villagers generally believe that the district office does very little for their local branch. Higher officials are thought to be mainly interested in collecting membership fees, and of only helping "richer" villages where newly established cash crops create exploitable wealth. Other difficulties arise from the fact that higher party officers are usually staffed by younger, more educated men whose views of village leaders can be hyper-critical.

A portion of the communications problem between the two party levels lies within the district party office. Like the village branch, the district office engages in a multitude of activities. No guidelines are created however, and village leaders are often confused as to what action is appropriate for them to take. Problems considered for settlement by district officials might include a marital quarrel in the district town, a bad-debt problem, an allegation against a merchant or trader, or a complaint concerning an unfair act by a government official. Welfare acts are also considered party business. If a man is released from prison and has no bus fare to his village, the party will assist him. Money for medicine may be given and medical advice offered. Special investigations are launched concerning such problems as thefts, beatings, school

²¹ Party directives in 1969 indicate awareness of this problem and an increased desire by the national party to facilitate local-level communication.

abuses, cheating by a shopkeeper or complaints about the hospital. The party is also engaged in economic enterprises. Building small party hotels, organizing cooperative societies such as carpenters groups and building societies are commonplace. Resettlement schemes, homes for TANU employees, and facilities for destitute elders are within the district party activities.

The many sides to the party create a basic problem for its district leaders: how to differentiate between an administrative activity that should more properly be carried out by a government organization, and a "political activity." Most district party officials are unable to define exactly what a political issue would be. One district official in western Tanzania suggested that it would be "any offense against the government." Another suggested a political issue was "anything needing investigation." The Area Commissioner, the chief party official of the district in Tabora, said the party could legitimately enter any issue "involving tensions and conflicts—such things as clashes between the staff of an organization, a man pushing too hard to get ahead, or a verbal attack on the government."

Although functionally diffused, party leaders do admit officially to some distinction between their areas of responsibility and those of the police, judiciary, and administration. Usually, however, no clear-cut idea exists when a party official's investigation encroaches on a police investigation, or when the party's right to judge and hold small trials encroaches on the judiciary. Although the district level officials are less flagrant in such mixing of channels, some confusion also exists at this level. The Area Commissioner, for example, is the head of both political and administrative functions in his district, and gives directions to both political and administrative leaders. Such confusion filters down to the village level and helps to create the local situation in which there is no distinction between administrative, party or police activities.

The difficulties in communication between the two party levels tend to inhibit participation in party affairs and to keep information and resources from flowing to the village areas. This breakdown in communication linkage is perhaps most graphically seen in statements made by a district party official and a village party official about how the *other man* carries out his work.²²

Village Party Chairman—a 47-year-old Zaramo who has lived in the village some 11 years. He came originally in 1957 as a *Kiongozi* or party

²² A Tabora District official and a Uyui village official interviewed 1965–66. The situation typified here was essentially the same in 1968, during a re-study of the area.

organizer (spearhead) and initially was extremely unpopular. He was accused of being a thief, of collecting party dues for his own purposes, and of being a rabble-rouser. He was often threatened with attack and initially made little headway until the local chief quietly lent his support to the party activities. By 1961, however, the village party leader had personally gained enough popularity to be elected the representative of the village to the district council. He has also held the party chairmanship since it was formed in 1959. His leadership position is reinforced by a partial ability to read and to write, by a flair for public speaking, and by virtue of his trade as a tailor which gives him constant contact with the public.

District Party Official—a 36-year-old Nyamwezi who has had 8 years of schooling and a great deal of experience in various jobs throughout East Africa. Before independence he worked on the Mombasa docks and as salesman for a tobacco company. He joined the party early in its formation, probably around 1956, and after independence was paid for his efforts with the chairmanship of a district office. He has drawn criticism for pushing the membership campaigns too hard, and for threatening people with mild forms of punishment if they do not pay their party dues.

- | <i>District Party Leader</i> | <i>Village Party Leader</i> |
|--|---|
| 1. "The village chairman is lazy and slow and often does not do his work properly." | "He pushes too hard and threatens to close the hospital and local buses to those who do not pay party dues." |
| 2. "He is often not serving TANU and is sometimes looking after his own interests." | "I have wondered if his real interest is in the nation or in himself." |
| 3. "He does not understand my problems and does not understand how to organize a local party." | "It is too difficult to talk to him. If I bring up a problem, he will interfere and some action will be taken against me. He does not understand my problems, he is not well-informed, so I do not go to him very often." |
| 4. "He is getting to be an old man and his effectiveness is seeping away." | "He is often acting as a <i>bwana mkubwa</i> (big man), although he is young." |

Key factors affecting the links between the district and the village areas are the graphic

differences between district-level leaders and their village-level counterparts. On the other hand, the survey findings indicate a strong similarity between village leaders and randomly selected farmers. No significant differences, for example, emerge between these two groups in such categories as age, education, attitudes toward magic and witchcraft, attitudes on why to send a child to school, etc. When village leaders, however, are compared to district leaders, several major differences occur.

The ages of district leaders tend to be younger than village-level leaders in all districts (Table 5).

dren, and understandably to have more possessions such as radios, bicycles, and tools. The overall picture of the district leader indicates a less parochial, less isolated individual who has some contact outside his immediate community. He has generally greater mobility and is more enlightened on the events affecting his time. He tends to have a technical competence in specialized areas as opposed to the more generalized skill of the village leader. He has probably resided in his community a shorter period of time and has fewer inter-personal contacts within the community. He is probably more inclined to accept the changing political symbols and fads as

TABLE 5. AGE OF VILLAGE-LEVEL LEADERS

	<i>Birth Date</i>			N.
	Before 1910	1910-1930	1930+	
District Leaders	3%	45%	52%	150
Village Leaders	26%	54%	20%	171

$\chi^2 = 49.23$, $df = 2$, $\alpha = 0.0$

The religion of district leaders tends to be Christian; there are no leaders at this level who claim pagan beliefs. On the other hand, village leaders tend to be Moslem.

Type of school attended also correlated significantly. District leaders tended to be graduates or have been enrolled in government schools whereas village leaders overwhelmingly had attended mission schools or Koranic schools. Implications in these findings suggest that the chance to reach a post as a district-level leader is significantly enhanced by the attendance of a government-run school.

Considering length of party membership, district leaders in two out of three of the districts surveyed tended to have been party members a significantly shorter period of time than had village leaders. These districts (Kisarawe and Rungwe) were also the districts in which the age difference between district leaders and village leaders tended to be the greatest, a factor which partially explains the findings. For Tabora District, which historically gave support to the party later than other areas of the nation, there was no significant difference between the length of party membership for the two leadership groups.

Other differences between the village leader and the district leader appeared in terms of life style. For example, the district leader's education, income per year, amount of travel, and frequency of travel tended to be higher in almost all cases. The district leader tended to have fewer numbers of wives, fewer numbers of chil-

they come from the capital. The differences between the two groups in age, education and income can be graphic and lead to antagonism. The district leader's ideas for initiating changes in the village may be based on a legitimate desire to bring advantages that he has seen elsewhere. The local leader, conversely, may have had no similar experience and obstruct any such changes. Such differences lead to rigidity and entrenchment. Village leaders retreat to the traditional beliefs and justifications of the past while district leaders escape into petty professionalism. Village leaders will then demand more fact-to-face confrontations before they will act on a specific project whereas their counterparts may wish fewer personal meetings and attempt to rely on bureaucratic channels. The result is a continued disruption in a communication between the two most vital levels of the political party.

Implications for the National Government

Political participation in the rural party is the implicit goal of TANU. To gain the continued participation of the peasant is the overriding problem facing national leaders. One of the key problems is that the party at the rural level is suffering the throes of general economic disenchantment following the high hopes of the nationalistic period. In spite of peasant expectation, little has changed in their essential routine. The economic life of the people has not been greatly altered and most of the lofty expectations of the pre-independence period are unreal-

ized. The party has been forced to shift from a nationalist protest organization to an agency for the mobilization of human and natural resources. Its new role is creative and positive. It is a role which in some respects is a contradiction of the earlier goals which were to bring about the destruction and downfall of the colonial regime. Those individuals who lead the nationalist protest had personal qualities which could arouse mass dissent. Although these nationalist leaders have remained in important offices, they do not necessarily have the talents nor the personal inclinations to provide the more mundane form of administrative leadership necessary for building a state.

Even those leaders who do combine administrative talents with some form of charismatic ability, face continued problems of peasant apathy toward the party, unpaid membership, and cynicism toward the government. As noted, links between the district and rural branches are difficult to maintain. Representation of the individual peasant's problems is on an *ad hoc* basis. The two-way highway that Julius Nyerere envisioned by which the goals and plans of the government reached the village and by which the problems and wishes of the people reached the government, is often simply not operative. The government's recruitment of rural leaders encounters basic problems of an individual's status, his traditional basis of legitimacy, and his kinship obligations. In many ethnic groups, there are strong pressures not to assume leadership for fear of alienating neighbors or of gaining undue economic advantages. In other areas there is little understanding of what a party leadership position entails.

Perhaps the most important problem concerning the political participation of peasants lies in how the central government consciously plans for such participation. There is a tendency for officials, particularly those in ministries dealing with resource planning to either implicitly or explicitly oppose political participation in specific geographic areas. This is because resources are allocated on a priority basis for economic development. Political participation without accompanying economic change is considered unwise, particularly if political stability of the geographic area is in question.

However, this form of Machiavellian banishment of inaccessible, semi-desert or exceptionally backward areas, mainly on a rationale of economic priority, may in fact be more politically dangerous than the cost-benefit thinking anticipates. Political participation is necessary for the entire population. If national leaders attempt to create "holding areas" where rural institutions are not encouraged, the inhabitants of

these areas are politically alienated as well as economically depressed. This process does not, however, exclude peasants from travelling to see strikingly better human conditions in the privileged areas. Nor does this form of planning prohibit migration out of the rural sectors to the over-crowded, socially-deprived urban areas. When such exposure does take place, the individual is in fact in the larger political arena. His disenchantment with the events in his home region and his knowledge of better conditions elsewhere make him a potential dissident and agitator. It may be argued that the difficulties this individual can cause the central government would be eliminated if he had opportunities to participate locally in political institutions which are engaged in economic development. If rural political institutions are to survive, they must be created universally. No amount of Machiavellian banishment and isolation, no amount of government refusal to plan for a depressed region will keep agitation from beginning. Once begun, it is impossible to predict the speed at which agitation can lead to collective, destructive political action.²³

In spite of the difficulties in gaining party participation, there are other strong reasons why national leaders persist in promoting such involvement. First, the party has a potential capability of economic mobilization. It serves as a catalyst of several local interests and, if supported, can be effective in reducing the conflicts brought about by rapid economic change. The rural political party is at the cutting edge of the national plans for agricultural development; its leaders can stimulate support for these plans and gain their acceptance among the local populace. Second, if there is no participation in the rural party, checks and balances on party leaders will not exist. The party apparatus has been constructed but, if it is not used and supported by the people, it can be misused by self-seeking local leaders who gain support from the remote higher party levels.

A further reason for the national leaders to encourage local participation is to facilitate the building of local institutions such as the cooperative societies and voluntary welfare associations. Like the party, these rural institutions introduce specific innovations that may benefit the peasant. Other reasons for participation exist. Party leaders at the local level are often alien to the village in which they are working. Acceptance of alien party leaders will eventually mean the acceptance of local leaders in other positions.

²³See Samuel Huntington "Political Development and Political Decay," *World Politics*, XVII (April, 1965), 386-430.

The process aids in the breaking down of ethnocentrism and the establishment of new forms of legitimacy. The local party, by encouraging peasant participation, is forcing the individual into a broader political system and exposing him to institutional structures that can represent larger numbers of people, and more effectively introduce modernizing innovations for the village.

Perhaps the most convincing argument for national leaders to promote and channel local participation is that political involvement by the peasant in some form has always occurred. Traditional political systems stimulated political participation in several forms as indicated by the constant intrigue and subversion that occurred within and between chieftains. Individuals have, and will participate politically over what affects them directly: their purse, their dignity, their job, their food, their status, or their future. What is new is the individual's participation in a broader system of values and in new institutional forms. As events move along in a new nation like Tanzania, it may be that peasant participation on a broader scale cannot be avoided.²⁴

²⁴ Goran Hyden, *Political Development in Rural Tanzania* (Nairobi: East African Publishing House, 1969), based on research in the Bukoba area, is directly related to the above findings. Comparison of the two studies shows similarities in the high degree of confidence the peasant has in the party, particularly as a "parental" authority; both studies indicate, however, the peasant feels the government does little for the people (pp. 180-212). Misuse of party authority exists in Bukoba, and many complaints similar to those in Tabora were reported by Hyden. These include extortion, peculation, undue court pressure, irregular party procedures, and coercion of Asians. Active resistance to the party directives also occurs, particularly surrounding the orders to up-root coffee trees. Clashes are common, often between old and young coffee planters in the party (pp. 184-191). Similar findings also exist on the multifaceted nature of the party, and that the party essentially operates in an immobilized, pedestrian society. Both studies indicate a significant improvement for peasants' opportunities to participate in local political issues since 1963 (p. 139). Difficulty in making distinctions between claimed party membership and actual party membership was also reported by Hyden (p. 151). In both studies party support exists outside party membership, and membership does not necessarily mean compliance with the party. Dissatisfaction with income, education and housing are similar in both studies (pp. 200-201).

By contrast, several differences exist in the find-

V. TOWARD A LOCAL-LEVEL THEORY OF PARTICIPATION

This section briefly summarizes the major conclusions of the study, puts forth a simplified model on the process of individual participation, and suggests several propositions that emerge from the model and the data. The propositions are the first step in establishing testable connections between data and a more theoretical scheme about participation.²⁵ The aim is to provide links to more generalizable micro-political concepts.²⁶

ings. Bukoba region has more highly developed communication facilities, and there is a greater dependence on the Village Development Committees to disseminate news. Higher levels of literacy and wealth explain some of the differences. Hyden's findings also differ on the assertion that the district and regional level officials are usually equalitarian and corrective of abuses. He points out the numerous dismissals President Nyerere has instigated for abusive or incompetent Regional and Area Commissioners. A further difference lies in the degree of expressed alienation and cynicism; Hyden reports far less than exists in Tabora Region (p. 216).

Only partial agreement exists on the role of traditional authority (pp. 106-124). In Bukoba, peasants are divided on the chief's contemporary legitimacy, whereas in Tabora, traditional leaders still exercise considerable authority. The Bukoba study indicates the Haya have a more cosmopolitan outlook than do the Nyamwezi—again a function of greater wealth, more educational possibilities, and proximity to an urban center; Kampala (p. 157). Political involvement, the level of discussion about politics, the frequency of such discussions, and relative political knowledge are all about equal in the two studies (pp. 217-228). The comparisons were discussed with Professor Hyden in Nairobi, July, 1969.

²⁵ The model's key variables are suggested by the empirical findings of the study; the model should have the capability of explaining how local-level participation occurs, and at the same time, serve to suggest propositions on peasant political behavior.

²⁶ The importance of local-level analysis is a recurring theme in recent literature in the sub-fields of political anthropology, local politics and development administration. For a methodological discussion of the implication of these sub-fields, see essays by Fred Burke, David Brokensha, Ronald Cohen, Nelson Kasfir, Alvin Magid, Melvin Perlman, Aiden Southall, Marc Swartz, and Rodger Yeager in Norman N. Miller (ed.), *Research in Rural Africa* (East Lansing, Michigan:

The major conclusions are:

1. The rural party is a multi-faceted institution that is acceptable to the rural people because it provides a broad range of services of value to the individual in his local political microcosm. Rural party functions include family mediation, administration, adjudication, police, welfare and propaganda.
2. Misuse of individual power exists in rural party situations because the regulations established by national leaders are not known to rural peoples, or because peasants are unable to communicate such abuses to higher authorities.
3. There remains a heavy reliance on traditional authority. The traditional political system with its institution of chieftaincy has socialized most peasants in their expectations of authority; there is little inclination to question the legitimacy of higher authority.
4. Although peasants hold varying ideas on what the party does for the people, there is overall satisfaction in Tanzania with the party as an agent for settling disputes; however there is a widespread feeling among peasants that the government and the national party have not done enough for local villages.
5. The political context in which the rural party operates is essentially an immobilized pedestrian society. Most important political considerations are face-to-face relations, kinship ties, localized boundaries, and the ecological dictates of an agrarian culture. Within this political context the process of issue satisfaction is informal, consensual and

pluralistic with most peasant allegiances dependent on the issue at stake.

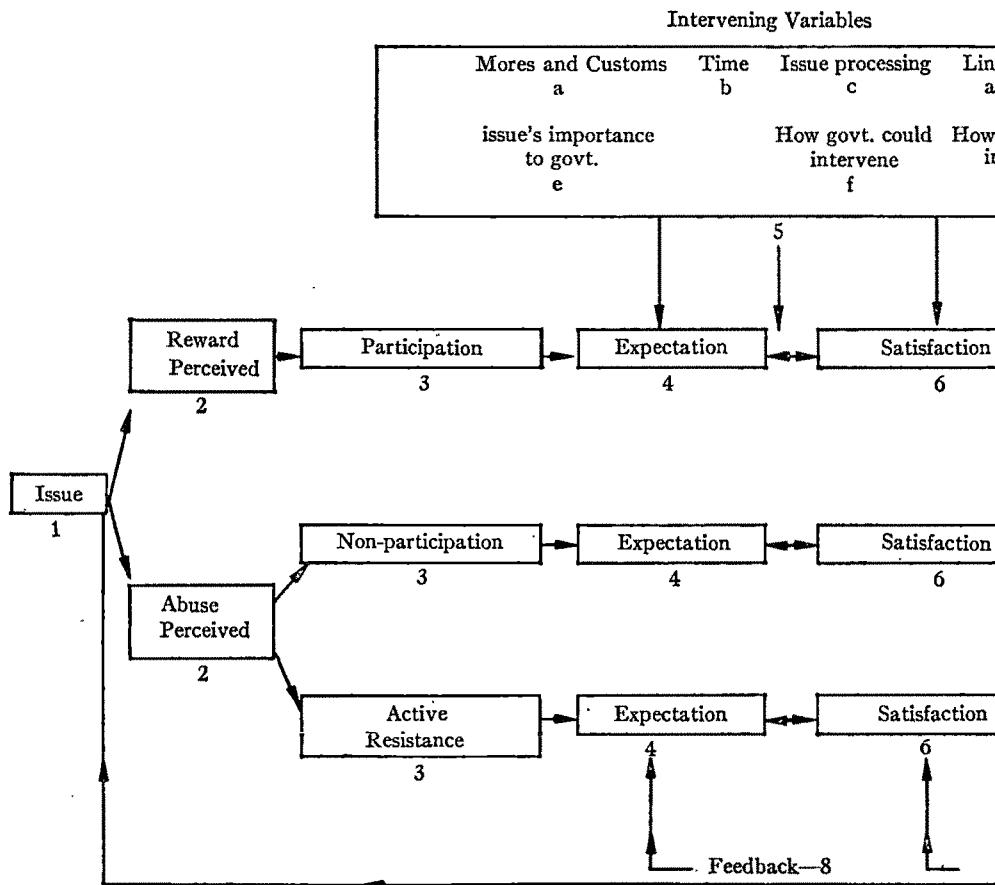

6. Communications within the rural party are ineffective because they are based on daily exchange and rumor diffusion within neighborhood networks. Communications linkages between the rural party and other party levels are ineffective. In addition to logistic problems, communication failure is based on the major differences that exist between village-level and district-level leaders in terms of age, religion, wealth, education, type of school attended, and general life style. The result is often a failure of information and resources to reach the rural areas.
7. The opposition of natural leaders to the bypassing of local institutions and to political participation in depressed areas for cost/benefit reasons may be unwise; such planning could trigger immigration to over-crowded areas, disenchantment with events in the home regions, political unrest, and large-scale hostility to government.

For the purposes of the model, specific variables that determine the process by which an individual participates in local-level institutions may be isolated as follows:

<u>Key Variables</u>	<u>Intervening Variables</u>
naturating of specific issue	mores and customs
perception of potential issue	time
perception of potential rewards	method of processing issue
patterns of participation	individual's links to government authority
expectations	issue's importance to government
satisfactions	how government could intervene
inclinations to change pattern feedback	how government does intervene

African Studies Center, Michigan State University, 1969), parts I, II. For a discussion of processional analysis at the local level see Marc Swartz, *et al.*, *Political Anthropology* (Chicago: Aldine, 1967); also see Swartz (ed.), *Local-Level Politics* (Chicago: Aldine, 1968). A number of local-level studies relate directly to the present article. For comparisons on the evolution of political changes in Tanzania see particularly J. Gus Liebenow, "Response to Planned Political Change in a Tanganyika Tribal Group," this REVIEW, L (June, 1956), 442-461; and Liebenow, "Legitimacy of Alien Relationships: The Nyatura of Tanganyika," *The Western Political Quarterly*, XIV (March, 1961), 64-86. For comparisons on the role of chiefs and traditional political systems in Tanzania see Hans Cory, *The Indigenous Political System of the Sukuma* (New York: Eagle Press, 1954). For comparison to local government processes see Fred G. Burke, *Local Government and Politics in Uganda* (Syracuse, N.Y.: Syracuse University Press, 1965).

The flow chart (Figure 1) illustrates the relationships between the variables. The basic process is first, that local-level participation depends initially on how a specific political issue is viewed by the individual, (1). If the issue is vital to his self-interest he will take a preliminary position and assess whether he should or should not participate. This is often determined by his perceived rewards from the many activities of the institution, as weighted against the potential

Flow-Chart: Relationships Determining Local-Level Participation

Figure 1

abuse he may suffer through involvement, (2). Potential abuse and the potential rewards are countervailing pressures. If he decides to participate on this particular issue, his personal expectations will immediately come to bear, (3, 4). If he decides not to participate or to actively resist the institution, his expectations on these decisions will also be activated, (3, 4). The degree of satisfaction each course of action gives the individual will be determined by his expectations, and by several intervening variables, (5). These include the prevailing mores and customs surrounding the issue, and his position on the issue, (5-a); the amount of time that the issue has been under consideration, (5-b); how the issue is processed locally, (5-c); what the local links are between the individual and higher levels of authority, (5-d); the issue's importance to higher levels of government, (5-e); how higher levels of government could intervene, (5-f); and how higher levels of government do intervene, (5-g). The intervening variables also influence the individual's expectation and satisfaction levels.

Depending on these factors, satisfaction in the course of action taken can either be attained or not attained, (6). The result at this point will influence a continued course of action in the same pattern, or will cause a move to one of the two alternative patterns, (7). This decision will in turn feed back to influence the individual's reaction to the next specific political issue that affects him directly, (8). The *sum* of the individual's actions on several issues over time determines the overall institutional participation by the individual. Participation is the collective result of an individual's reaction to specific, concrete political issues that affect him directly.

Several specific propositions could be evolved directly from the model. For example:

1. If satisfaction on the specific issue is attained, the individual is inclined to continue the pattern of political participation he has begun.
2. If abuse on a specific issue or action is expected, the individual will be inclined to withdraw from participation or actively resist the institution.
3. Because expectations of rewards are often unreal, satisfactions on individual issues are often not attained, and withdrawal from the institution's activities occurs.
4. Local-level participation is based on the individual's collective response to specific political issues that he perceives to be of immediate importance to him.
5. If a local leader must use force to obtain his goals, an inverse relationship exists between the amount of force, and the benefits his constituents see themselves receiving from his presence in office.
6. If abuse of power by a local authority occurs, it may be related to the demands of the national government to bring about rapid economic and political change at the local level.
7. If pre-independence, nationalistic leaders are retained at the local level, administrative efficiency and rural economic advancement will be impaired.
8. Local-level institutions grow, and are probably more successful, when leaders who are alien to the local area are accepted by the people.
9. Because of distrust for outside authority, the peasant will attempt to keep the process of issue settlement at the local, face-to-face level.

In realistic terms, the "force" a leader uses may in fact be varying degrees of persuasion. The benefit the constituents see themselves receiving from the individual may overlap with the benefits they expect from the "office" of which the leader is a particular incumbent. The ratio of expectations to satisfactions gained from the leader is not exact, and one particular expectation is not necessarily measured against the satisfaction received on a particular issue.

Misuse of authority is inevitable when the national leadership permits and encourages various forms of coercion to be used to mobilize a local area. The distinction between acceptable pressure and unacceptable coercion is a delicate balance that constantly needs redefinition at both the policy-making and the implementation level. Such pressures are the net result of government demands to create rapid economic and political change in relatively short periods of time. For the individual, it may be argued, pressure becomes coercion when he is forced to act in spite of strong personal objections to doing so.

Leaders who came to power during the pre-independence nationalistic period tended to do so on the basis of charismatic, crowdpleasing abilities. Many are entrenched in leadership posts, although they often lack the administrative talents, or inclination, to deal with the more routinized, mundane tasks of rural development.

Because party leaders who were born in the village area tend to be well known and to have many kinship ties and obligations, they are often drawn into biased judgments. Local leaders alien to the area can promote confidence and participation in the party because they offer more objective judgments.

More general propositions emerge from the model when considered in conjunction with the findings of the study:

Local party leaders generally hold the same view of the world, and are similar in attitude to randomly selected peasants. The peasant is unsure of the views of higher level authorities and is therefore inclined to keep most conflict issues within the confines of his political microcosm. He will maximize his future bargaining potential by maintaining relations with all leadership groups: traditional, administrative and party.

The model of political participation, and the propositions should help to generate further questions about how local-level institutions function. The vital importance of such questions lies in the primary purpose of the rural organization. Organizations like the rural party which deal *directly* with the people are the institutional nerve-endings of the entire governmental process. They are the point of the elaborate administrative apparatus, the point of the total bureaucratic system. If there is no understanding of how these local institutions operate, and if there is no understanding of the political character of the rural peoples, then there is no effective way government can channel resources and information to the villages. There will be no way the assault on rural deprivation can be continued. Most important, there will be no way the national leaders can avoid being overtaken and run down by unforeseen, uncontrolled events in the rural areas.

APPENDIX

The survey of 434 peasants and peasant leaders was carried out in Tabora, Rungwe and Kisarawe Districts between March 1965 and January 1966. The instrument consisted of 120 questions on biography, life-style, political and economic opinion, and political and economic awareness. The interviews were conducted by three research assistants, each a resident of his respective district and a member of the main ethnic group. The questionnaire was pre-tested for six months, and each assistant did 20 trial interviews to assure his total understanding of the questionnaire. The interviews were conducted in Swahili, following lengthy briefing of the research assistants on the meaning of key terms in the questionnaire and their commentators. Distinctions between terms such as "government," "party," "politics," "nation," and "leader" were particularly noted. Because of the difficulty in administering questionnaires to some peasants, interviewers were allowed to give limited interpretation of questions, but were cautioned on leading respondents.

The 434 respondents were selected by one of two methods. Approximately half were ran-

domly selected farmers whose names were taken from the tax rolls of the local government. The remainder were selected as village leaders. The latter method was a combination of the standard reputational, positional and panel-of-judges techniques. A preliminary list of leaders from each of the twelve villages under study was compiled. The list included elected members of the Village Development Committees (VDC), plus local administrators, party officials and traditional headmen, sub-chiefs or chiefs and other suggested influentials. This complete list of potential leaders was then presented to each member of the VDC. This panel of judges rank-ordered the names in terms of their relative influence in the village. The results were tallied and the top 25 names were considered to be in the village leadership class. They were thereafter interviewed in the same manner and with the same questionnaire as the randomly selected farmers. For this article the distinctions between leader and non-leader are not focused upon; in the data presented there were no significant differences between the two groups. For discussion of the techniques used see Wendell Bell, Richard J. Hill and Charles R. Wright, *Public Leadership* (San Francisco: Chandler, 1961), ch. 1.

The location of the three rural areas (districts) was initially chosen on the basis of the traditional political system that existed among the major ethnic groups of the area. Thus the Zaramo people of Kisarawe District (coastal area) were chosen because they represented an acephalated, fragmented authority system which traditionally had no political integration above the clan level. The Nyakyusa of Rungwe district (highland area) were considered a middle-range example of political authority; they traditionally had some 90 small chiefdoms, each of which was largely autonomous. There was no political integration above the petty chiefdom level, although the Nyakyusa as a whole share a common language, customs and history. Third, the Nyamwezi of Tabora district (plateau area) were chosen as a research area because they represented a political system, that although basically made up of petty chiefdoms, had experienced some political integration under senior chiefs such as Mirambo and Fundikira. The three districts also represented diverse agricultural and geographic conditions (coastal, highland, plateau). Tanzania's main religious and educational institutions were also represented in the selection.

The actual field method was to spend seven to eight months in each of the three districts; in each area a basic research village was chosen in which to reside. Interviewing was done in this

village and thereafter in three villages located in representative sections of the district. The interviews were usually conducted at the farmer's homestead, or in the case of party and administrative leaders, at local offices.

The data was coded and processed at Michigan State University. Interviewer bias between the three assistants was tested with negative results. The general findings and impressions were reevaluated during a re-study in East Africa in 1967-68 and 1969. At this time several of the findings included in the preliminary drafts were eliminated.

Although the sample is not representative of all of Tanzania, the findings would hold for a major portion of that nation. Subsequent local-

level research will hopefully test these findings in other areas. For background literature on the three areas under study see for Tabora and the Nyamwezi, Rev. Fr. Boesch, *Les Banyamwezi peuple de l'Afrique orientale* (Münster: Aschendorff, 1930), and R. G. Abrahams, *The Political Organization of Unyamwezi* (New York: Cambridge University Press, 1967); for the Nyakyusa of Rungwe district see Monica Wilson, *Good Company: A Study of Nyakyusa Age-Villages* (London: Oxford University Press, 1951); and for the Zaramo of Kisarawe district see A. H. J. Prins, *The Swahili Speaking People of Zanzibar and the East African Coast* (London: International African Institute, 1961).

THE EMERGENCE OF POLITICAL SCIENCE IN COMMUNIST COUNTRIES

DAVID E. POWELL AND PAUL SHOUP

University of Virginia

The scientific study of politics requires an environment which accepts free inquiry and discussion. Scholars must be permitted to ask questions of their own choosing, gather data without hindrance, and communicate freely with one another about their findings. To be sure, freedom to investigate sensitive policy matters is limited by all governments. Moreover, political scientists themselves inevitably introduce some measure of their own values or ideological predispositions into their works. But it is obvious that without the guarantee of certain minimum freedoms, political science as we know it in the West could never exist.

Communist regimes traditionally have made independent inquiry or objective discussion of political phenomena impossible. In the Stalinist period, scholarly analyses of politics—or, for that matter, of aesthetic, literary, moral or economic questions—amounted to little more than doctrinal exegesis or the elaboration of practical measures to implement the Party's demands. An autonomous social science in Stalin's Russia or Eastern Europe was simply unthinkable.

Since the dictator's death, however, Communist governments have modified their hostility toward the social sciences in general, and toward political science in particular. A decade of de-Stalinization has been accompanied by steps to encourage the scientific study of politics. In several East European countries, political science now enjoys recognition as a discipline in its own right.

This does not mean that political science in Communist countries has freed itself of political controls, or that what is presented as political science is always of scholarly merit. On the contrary, one of the greatest difficulties in evaluating the emergence of a Communist political science stems from the lack of any clear cut dividing line between ideological or political works on the one hand, and studies of genuine scholarly merit on the other. In making distinctions between these two categories of writings on politics it is necessary to apply criteria which take into account the realities of the political science profession in Communist countries, while following broadly accepted standards of what may properly be termed political science.

First, it is clear that propaganda and dogma do not properly belong within the discipline. At

the same time, there is no justification for rejecting works as unscholarly or unscientific simply because their approach is Marxist. The principle that separates propaganda and polemics from scholarship is the elusive but fundamental consideration of independence of judgment. As F. Burlatskii, a Soviet philosopher, has remarked, political science asks questions "whose answers are not known beforehand."

A second criterion for distinguishing between works which are political science and those which are not concerns the extent to which Communist scholars rely on authorities other than the standard works of Communist doctrine. Such a practice, of course, is subject to abuse by writers who seek to give official dogma a scholarly veneer by reference to non-Communist as well as Communist sources. On the other hand, attempts to exploit Western scholarship for official ends cannot disguise the fact that in those countries where political science has been allowed to develop, there has been a sharp break with Marxist-Leninist approaches to politics, and much of the terminology, method and conceptual framework of Western political science has been adopted. In such cases, one can speak of a fundamental change in method, in which the standards of the discipline replace those of the ideology in determining the validity of research and scholarly analysis.

Finally, it should be noted that contributions of real merit can be made to the study of politics by persons who are trained in other fields, particularly in countries where political science is not officially recognized as a discipline in its own right. Given the hostility to the discipline present in many Communist countries, this may be the only way in which the scientific study of politics can develop.

We do not devote equal attention to each country of the Communist world. In Albania, Bulgaria, East Germany and Hungary, and in the non-European Communist states as well, there has been little or no public discussion of the merits of political science. Studies on political questions published in these countries are dogmatic and polemical. In other Communist countries, conditions vary widely. Poland and Yugoslavia have shown the most progress; Rumania and Czechoslovakia have only recently accepted the concept of political science as a dis-

cipline. The Soviet Union has yet to officially sanction research and teaching in political science, but maintains a political science association and tolerates research on political subjects by social scientists in related fields. Our discussion will deal first with the USSR, and then turn to Eastern Europe, where the primary focus will be on the two countries in which political science has developed the furthest—Poland and Yugoslavia.

With these remarks in mind, we can now proceed to a more detailed examination of political science in the USSR and Eastern Europe.

I. POLITICAL SCIENCE IN THE SOVIET UNION

Conditions in the Soviet Union are far from congenial to the development of a genuine political science. While many of the stultifying constraints on intellectual inquiry introduced by Stalin have been discarded or modified, and social science research has in some measure replaced Marxist-Leninist dogma, adherents of a Western-style political science still face almost insuperable obstacles. Soviet leaders have, by and large, been extremely reluctant to permit research and writing on the essential questions of political science.

Soviet writers blame Stalin and his "cult of personality" for the slow development of social science in their country. Under Stalin's rule, social science involved a process of "dogmatic deduction, alien to the spirit of Marxism, which 'fitted' real phenomena and facts to the ideas of J. V. Stalin. Inductive research . . . was forgotten."¹ Stalin's views "on any question, and most of all on the development of social phenomena, were considered 'truth of the highest order.'"² With Khrushchev's assaults on Stalin at the 20th CPSU Congress in 1956 and the 22nd Congress in 1961, conditions for creating an empirical social science were materially improved.

Progress, however, has been slow. The 1961 Party Program, for example, while encouraging social scientists to investigate contemporary political problems, reminded them that such studies:

. . . must disclose the law-governed process of mankind's advance toward communism, the change of the balance of forces in favor of socialism,

¹G. V. Osipov, *et al.*, "Marksistskaya sotsiologiya i sotsiologicheskyye issledovaniya [Marxist Sociology and Sociological Research]," *Nauchnyye Doklady Vysshey Shkoly*, No. 5, 1962, 24.

the aggravation of the general crisis of capitalism, the breakup of the colonial system of imperialism, and the upsurge of the national-liberation movement of the peoples.³

The conclusions, already dogmatically established, are thus to be confirmed by research. This is hardly social science. Rather, it requires conscious selectivity and dedication to (or willingness to be used for) a political purpose.

The past decade has seen Soviet scholars increasingly willing to engage in empirical research—or, as it is known in the USSR, "concrete sociological investigations." Their earliest efforts were far from rigorous; the first public opinion polls lacked methodological sophistication and had an obvious political bent.⁴ The intellectual community was officially committed to the empirical approach in 1962, when the USSR Academy of Sciences formally resolved that, "a necessary condition for the success of scientific work on urgent problems of the social sciences is the comprehensive development of concrete sociological investigations. . . ."⁵ Since that time, Soviet social scientists have acquired considerable sophistication in the use of modern research techniques and have recently begun to apply these to the study of political matters. Indeed, many of the techniques familiar in the West are now employed: scaling techniques (e.g. Guttman and Coombs scales), factor analysis, content analysis, and the use of computers.⁶

It should be pointed out that some Soviet social scientists, like their counterparts in the West, have expressed concern (or perhaps a measure of insecurity) over the increasing emphasis on quantitative methods. They have spoken out against what they regard as "the fetishism of numbers" and even expressed doubts about such concepts as arithmetic average, degree of error, or correlation. They refer to sampling surveys as "creeping empiricism" (*polzuchii empirizm*) and accuse certain polling enthusiasts of "questionnaire mania" (*anketomaniya*).⁷ They have found powerful support in the Party's Central Committee, whose members have little regard for empirical research lacking in "serious theoretical and practical importance."⁸

Given the indifference or even hostility of the highest Party authorities, plus the traditionally value laden orientation of Soviet social science, two facts become clear. First, only by emphasizing the utilitarian character of their research can empirical social scientists gain the necessary latitude to move in new directions. And second, it is difficult for a discipline such as political science to gain official acceptance, for its value free, "pure science" approach may threaten the existing order. Adherents of political science, then, must adopt an indirect approach toward establishing their discipline: by focusing on methodology and concrete sociological investigations, they may be able to build a science of politics. It is precisely such empirical investigations, conducted by representatives of other disciplines, which have already produced studies ap-

propriately called political science. At the same time, they have stimulated a number of Soviet scholars to seek the creation of political science as an independent field.

There is at present no academic discipline in the Soviet Union known as political science.⁹ Nor are there political scientists. There is, however, a Soviet Political Science Association (SPSA),¹⁰ an organization which, for the past decade, has brought together Soviet scholars studying political institutions and practices. While such a body would seem a likely vehicle for establishing an independent political science discipline, it is, paradoxically, one of the major obstacles to such a development.

The SPSA is comprised mainly of legal scholars, a fact with far-reaching implications for its orientation toward political science as a specialized field of study.¹¹ These will be dealt with more fully below. Here we may point to the legal-institutional focus of the Association and its members. The organization is rather small, with total membership amounting in 1966 to only some 360 persons.¹² The current President (V. M. Chkhikvadze), his predecessor (V. S. Tadevosian), and four of the Association's six vice-presidents are legal scholars, as are seventeen members of the nineteen-man executive committee.¹³

⁹ When writing for a foreign audience, Soviet scholars sometimes suggest that political science is a recognized field of study in the USSR. See, e.g., M. Zvorykin, "The Social Sciences in the USSR: Achievements and Trends," *International Social Science Journal* (hereafter *ISSJ*), 16, No. 4 (1964), 588-602; Makar Gorianov and Igor Glagoliev, "Notes Concerning Research on Peace and Disarmament Conducted in the USSR," *ISSJ*, 17, No. 3 (1965), 417-419. Zvorykin (596-597) defines political science as "the study of the political superstructure of a given society."

¹⁰ Until 1965, this organization was known as the Soviet Association of Political (State) Sciences. Its present name is, more properly, the Soviet Association of Political Sciences.

¹¹ E. V. Tadevosian, then President of the Association, is reported to have assured a Western scholar that creation of the organization did not imply recognition of political science as an independent discipline. See Gordon Skilling, "In Search of Political Science in the USSR," *Canadian Journal of Economics and Political Science*, 29, No. 4 (November, 1963), 519.

¹² I. T. Pomerantsev, "V Sovetskoi assotsiatsii politicheskikh nauk [In the Soviet Political Science Association], *SGP*, No. 6, 1966, 135.

¹³ G. S. Ostroumov, "Nauchnyye osnovy politiki — v tsentre vnimaniya Sovetskoi assotsiatsii politiki

The SPSA has two purposes: (1) to facilitate Soviet dealings with Western political scientists, particularly through the International Political Science Association, and (2) to criticize Western political science, especially those works which challenge Soviet ideology or conduct.

Soviet delegates have been increasingly active at IPSA meetings and have attended IPSA Congresses and round table discussions since the Fifth Congress in 1961. For some time, they expressed concern about their subordinate role in the organization and demanded that they be accorded the status appropriate to a Great Power. At the Seventh Congress, held in Brussels in 1967, Chkhikvadze was named a vice-president of the IPSA, and another SPSA representative delivered one of the major addresses to the Congress. These developments, an official of SPSA has argued, are evidence of the impressive stature of Soviet political science.¹⁴

To the Soviet Association, an international gathering is an ideological battleground and a proper forum for East-West confrontations. Indeed, the SPSA has even attempted to use the IPSA as a vehicle for official Soviet foreign policy. Thus, in 1962 the SPSA appealed to the American Political Science Association to "raise its voice in protest" against the "persecution" of the Communist Party of the USA.¹⁵ Having failed to persuade the American Association to act, the Soviets turned to the IPSA with a similar protest.¹⁶ The IPSA, too, chose not to accept the Soviet challenge.

The purpose of the SPSA, then is not simply scholarly contact and exchanges of views. It is also required to "unmask the slanderous fabrications" of "bourgeois political science" and the horrors of "bourgeois" political life. The first conference of the SPSA was told that "criticism of contemporary bourgeois political science is not conducted sharply and actively enough. A

comprehensive criticism of bourgeois political science is needed . . ."¹⁷ Western political science, far from being the scientific study of politics, is depicted as a prescriptive, value-laden pseudo-discipline. It supports the existing order by devising reformist schemes and by conducting "an active struggle with Marxism."¹⁸

Clearly, the Soviet Political Science Association is more interested in polemics and official dogma than in developing a scientific study of politics. Those anxious to create a genuine political science have had to approach their objective from another direction.

The removal of Nikita Khrushchev from power in October, 1964 provided adherents of political science with an opportunity to state their case. On January 10, 1965, *Pravda* published a major article by F. Burlatskii, a philosophy professor and member of the executive committee of the SPSA, explicitly calling for the establishment of such a science.¹⁹ Emphasizing the utilitarian purposes of his proposals, and citing Khrushchev's errors as evidence of what an unscientific, unsystematic approach to political problems can lead to, Burlatskii urged that a genuine political science be created. Although he focused on its instrumental value, Burlatskii's essential purpose was quite different. He sought to take the study of politics out of the hands of the dogmatists and place it the hands of true social scientists. He dismissed "the tendency to

comment"—the established practice of interpreting and elucidating known Marxist texts. A "truly profound investigation" of politics, according to Burlatskii, "presupposes the raising of questions whose answers are not known beforehand." This is a demand for a true political science.

Burlatskii also called for the scientific discussion of a wide range of political questions, both domestic and international. He thus challenged the traditional Soviet approach, which involves reliance on the "classics of Marxism-Leninism" and almost exclusive concern with the formal institutions of government. Burlatskii advocated a kind of behavioralism: he hoped to investigate real political processes involving the entire range of political actors, i.e., individuals, the party, the state apparatus, and public organizations such as the Komsomol and the trade unions.

Burlatskii's article precipitated a lively debate among Soviet scholars on the merits of political science. His supporters, despite their differences, are united in urging a shift from dogma to science.²⁰ His opponents, without specifically addressing themselves to Burlatskii's criticisms, have dismissed his proposals as superfluous.

Resistance to the suggestions of the Burlatskii group has come from two sources. One is comprised of doctrinaire ideologists, those for whom the "sciences" of Marxism-Leninism and Scientific Communism provide the answers to all political questions. This group, whose members include E. V. Tadevosian, former President of the Soviet Political Science Association, argues that Marxism-Leninism is *the* political science.²¹

They have put Burlatskii and his allies in the awkward position of appearing to challenge the authority of Marxism-Leninism. The other group resisting political science consists of those legal scholars—including many members of the SPSA—who resent the intrusion of a new discipline into a field they consider properly their own. Academic discussion of political and governmental questions has been the responsibility of specialists in jurisprudence. Now, as one non-Soviet scholar has remarked, the proposal to establish political science as an independent field has evoked the greatest hostility from "precisely those jurists whose own discipline stood to be restricted by the new arrangement."²² Some of them refuse to set off any science as "political," in contrast with other "non-political" social sciences.²³ Others complain about attempts to "politicize" or "sociologize" jurisprudence.²⁴ A third group is willing to extend the purview of the already existing "political sciences" (jurisprudence and the science of state and law) and "bring them up to date."²⁵ They agree only on one matter: the need to combat political science.

While the ideologists and jurists differ with one another and among themselves in many respects, they seem to share a common concern: to create an independent political science would be to create a rival. Beneath the intellectual arguments and rhetoric, it would seem, lie entrenched interests which want to retain control over scholarly inquiry into political matters. This conservative alliance of ideologists and legal specialists, whether tacit or formal, has been a powerful barrier to the establishment of politi-

cheskikh nauk," *op. cit.*, 4; Ostroumov (1965), *op. cit.*, 148.

Churchward, "Towards a Soviet Political Science," *Australian Journal of Politics and History*, 12, No. 1 (May, 1966), 66-75.

²³ Ostroumov (1968), *op. cit.*, 24.

²⁴ According to P. N. Galanza, jurists ought to deal with political science only if "the legitimacy of the latter should ultimately be proved." See Ostroumov (1965), *op. cit.*, 149, and Bohdan R. Bociurkiw, "The Post-Stalin 'Thaw' and Soviet Political Science," *Canadian Journal of Economics and Political Science*, XXX, No. 1 (February, 1964), 33.

²⁵ Ostroumov (1965), *op. cit.*, 149.

cal science. Plans to introduce a political science course in secondary schools in 1961-62 were canceled abruptly in the spring of 1961, and a course on the USSR Constitution was substituted.²⁶ Formal instruction in political science at the university level, too, has been discouraged.²⁷ Clearly, then, to find evidence of political science in the USSR, we will have to enlarge the scope of our inquiry.

Soviet scholars in a variety of other social sciences, from history to computer science, have been engaged in research which can properly be termed political science. Their efforts are as yet very uneven: some mix official dogma with scientific inquiry, while others focus their attention on matters of only marginal concern. But important questions are being asked, and the rough outlines of a Soviet political science are clearly visible. Certain fields within Soviet "political science" are more advanced than others. Non-polemical writings in political theory, comparative government and international relations, for example, seldom appear. These fields are still the domain of ideologists and politicians; scholars are called upon merely to provide support for officially prescribed interpretations and conclusions. The fields of local government and public administration, on the other hand, have received considerable scholarly attention and show promise of achieving professional, scientific standards.

The operation of local government has been the subject of several scholarly inquiries in recent years. The most important of these are studies of local soviets in the Siberian city of Irkutsk and in the republic of Estonia. Both investigations make use of survey research techniques, sampling the opinions of representative groups of deputies and—in the Siberian study—the deputies' constituents as well. The Siberian research team has focused its attention on three questions: (1) relations between deputies and their constituents, (2) work patterns of deputies, and (3) ways to improve the work of deputies. Among their more interesting findings was the fact that fewer than 10% of the citizens they polled knew the names of the local deputies for whom they had voted. At the same time, the investigators discovered, 13% of the population had contacted their deputies at least once within the past year. Of these, almost half (44%)

raised questions of importance only to their families, while only about 8% were interested in matters of broad social significance, i.e., concerning the entire city or their own borough.²⁸

The Estonian researchers have looked into related questions. A poll of almost 1,000 deputies indicated that, while there are significant differences among individual deputies, few devote an appreciable amount of time to their work. It appears, moreover, that deputies spend less time performing political services in their districts than they do in official meetings. And, when asked how well they performed their tasks, a large majority (77.6%) expressed reservations. They pointed to two major factors: (1) their lack of experience and (2) inadequate working conditions, i.e., lack of assistance from local agencies, lack of funds, and the indifference of higher bodies, particularly Party officials.²⁹

The beginnings of a scientific approach can also be seen in the field of public administration. Soviet representatives have participated in meetings of the International Institute of Administrative Sciences since 1956. They have adopted a number of "bourgeois" suggestions in such areas as planning and budgeting.³⁰ More recently, scholars have pointed to the irrationality of Nikita Khrushchev's frequent reorganizations and have called instead for more systematic measures. As one writer urged: "not one reorganization or restructuring of the administration without science; the first word in organizing the administrative apparatus belongs to science."³¹

²⁷ Ostroumov (1965), *op. cit.*, 151.

Soviet scholars are trying to create a science of administration. There have been numerous proposals to channel thinking in this area, including suggestions for a science of organization, a science of administration, a science of "social administration," and a science of "Soviet construction."³² Several scholars have been exploring a systems approach to administrative questions. The philosopher V. G. Afanasiev, for example, has developed a theory of society as a complex administrative system—an "integral self-regulating system," as he terms it.³³ A legal scholar, Ts. Yampolskaya, has carried out the most imaginative research in the field of admin-

istration, using a systems approach. She and others from the Institute of State and Law have investigated the workings of the Kazakhstan Ministry of Culture, examining the correspondence reaching, leaving and circulating within the Ministry. According to Yampolskaya, "the routes and rates of document circulation . . . are . . . significant indices of the correctness or incorrectness of the internal structure of the system." By studying the administrative system and its subsystems, she has been able to work out, at least in a preliminary way, measures of responsiveness, initiative, leadership and control.³⁴

Soviet social scientists are exploring a number of other questions which are clearly within the purview of political science. In addition, they have identified a broad array of important political matters which they would like to investigate, including many that traditionally have been regarded as too sensitive or controversial for scientific inquiry. Prospects for a thorough investigation of all these subjects is problematical, and here we can only outline recent efforts and proposals.

Small group behavior is a subject of increasing scholarly interest. Several investigators presently are working in this area, and a conference at Moscow State University in late 1967 indicated that important "political science" questions are being explored. Among the more imaginative investigators is I. V. Sergeyeva, who has been examining patterns of leadership in small groups. She has isolated distinctive leadership types, e.g., "planners," "arbiters," "experts" and "ideologists."³⁵ Other researchers have focused on communications patterns regulating small group behavior, changes in individual and group values, and the dynamics of socialization.³⁶

Investigators in other areas, too, have been examining "political science" questions. In the field of international relations, several social scientists have begun to work with game theory, simulation and modelling, as an aid in analyzing international conflicts.³⁷ In addition, A. V. Bara-

nauki upravleniya v sovremennyy period [On the Scope and Tasks of the Science of Administration in the Current Period], *SGP*, No. 2, 1965, 87-88. See also D. A. nov has been studying changes in the values of the Soviet leadership by performing a content analysis of the newspaper *Izvestia* during the period 1919-1964.³⁸ A. I. Verkhovskaya has begun to analyze letters to the editors of newspapers.³⁹ A team of researchers at Tartu University in Estonia is investigating, *inter alia*, the political views of 1,000 university students, a project whose followup interviews will continue into the early 1970's.⁴⁰ Even the extremely sensitive subject of the attitudes of various nationality groups toward one another and toward certain social and political questions is now being examined.⁴¹

Perhaps most significantly, Soviet social scientists have begun to treat the work of Western political scientists with greater respect. The American literature on mass communications, for example, has aroused considerable interest

and enthusiasm.⁴² Moreover, Soviet scholars have published a number of relatively non-polemical works on "bourgeois" government, relying almost exclusively on Western sources and explicitly adopting the findings of Western scholars. Studies of American federalism and of federal efforts to regulate campaign spending are good examples of this genre; while they do not demonstrate original scholarship, they treat their subject in a detached and unemotional manner.⁴³ Almost inevitably, however, even the best of these works are marred by the sudden insertion of gratuitous propaganda slogans.

⁴⁴ For example, in his study of American campaign spending, Dmitriyev argues that only the American working class, struggling "to create a broad anti-monopoly front and to democratize the country's political life," can prevent abuses. Dmitriyev, *op. cit.*, 116. See also R. Kh. Vil'danov, *Konstitutsii v politicheskoi sisteme burzhuanogo*

This need not be a disabling problem; even works marred by the presence of unwarranted or polemical remarks can contribute to the growth of a more scientific study of politics. Thus, while the Soviet social scientist Yermolenko has attacked Herman Kahn for allegedly advocating nuclear war, he has also acknowledged that "Kahn's reasoning could be of some positive value."⁴⁵ The implications of such an attitude are vast indeed.

Proposals for future research provide additional momentum in the direction of political science. Many of these suggestions reveal an increasing impatience with traditional descriptive-institutional studies and favor a behavioral approach. "For many years," a leading Soviet jurist has written, "Soviet public law specialists confined themselves . . . primarily to commentaries upon various decisions and provisions of the USSR Constitution." He has called instead for survey research into such matters as reasons for the recall of deputies, and the opinions of deputies and officials of soviets.⁴⁶ Another member of the legal profession has urged research into other significant questions, e.g., relations between individual Party committees and soviets, relations between local soviets and their executive committees, and even the "effectiveness" of the existing election system, i.e., its capacity to provide adequate representation for the citizenry).⁴⁷

The most dramatic and far-reaching suggestions for scientific study of political affairs have come from R. A. Safarov of the Institute of State and Law.⁴⁸ He has proposed that an Institute of Public Opinion be established under the Academy's auspices. It would conduct regular samplings of public opinion, using rigorous scientific procedures, and explore basic political questions. To be sure, an Institute of Public Opinion has been operating in the USSR since 1960, under the auspices of the youth newspaper *Komsomolskaya Pravda*. Its activities, however, often have deviated from acceptable scientific

practice, and it has avoided matters of direct political concern.⁴⁹ Safarov's Institute would be policy-oriented: it would take samplings both before and after official policies were adopted. His purpose is to bring public policy into line with public opinion—a dramatic change from today's practice of asserting that the Party's policies are public opinion. Safarov would poll the citizenry on major questions of domestic and foreign policy, including reforms in the administrative structure, the activity of public officials, and even questions of labor law, pensions, collective farm law, and civil and criminal law. Effective government, he argues, requires responsiveness to true public opinion. At the same time, he emphasizes that empirical social science can be an effective aid to the Party; it can remove existing sources of dissatisfaction and improve the direction and administration of society.

In the near future, we can expect continuing challenges to Party ideologists by social scientists anxious to expand their field of research. If they continue to circumvent or even ignore the Party's demands for a "class viewpoint" in the study of politics, adherents of a scientific approach may make further progress. The Party, because it finds the promise of political science inviting as well as threatening, seems willing at this time to permit some measure of independent research.⁵⁰ But the regime's pervasive concern with *partiinnost* (party-mindedness) and increasing emphasis on proper Marxist-Leninist indoctrination⁵¹ suggest that it will be difficult indeed to transform this greater measure of independence into a value-free political science.

II. EASTERN EUROPE

The growth of political science in Eastern Europe has not been uniform. Political science associations exist in four East European countries: Poland, Czechoslovakia, Yugoslavia

obshchestva [Constitutions in the Political System of Bourgeois Society], 1968.

and Rumania.⁵² Of these four, however, only Poland and Yugoslavia have advanced to the point where the study of the discipline has had an impact on teaching and research in the social sciences. Even in these two countries, there are important differences in respect to the achievements of and prospects for the profession.

In Poland, an Association of Political Science was established in 1957 as a loose federation of learned societies concerned with the subject matter of political science.⁵³ In 1960 the association was reorganized to permit membership on the part of individuals; since that time the group has been active in holding conferences of its members and sending delegations to congresses of the IPSA. On occasion the Party has attempted to utilize the association to control political science in Poland, but this effort has not met with great success. The Polish Association, in contrast to its counterpart in the USSR, has a record of defending the rights of its members, and supporting the growth of an independent political science discipline in Poland.

While many institutions have been engaged in research in political science in Poland over the past decade, resistance to the new discipline on the part of traditionally oriented faculties for many years limited the teaching of political science in the universities to a chair in political sociology at Warsaw University. In 1963 political science was included in the curriculum of a limited number of institutions of higher learning in the form of a course entitled "The Fundamentals of Political Science," and in 1965 the

Institute for the Political Sciences was established with the objective of training persons to teach the "Fundamentals" course. While the formation of the Institute, with a five year program in political science, was a victory for the advocates of the profession, the "Fundamentals" course has been primarily a means of political education and indoctrination and only secondarily concerned with imparting a knowledge of the discipline. With the extension of the course to all institutions of higher education in the fall of 1969, political science teaching in Poland became even more closely identified with the ideological and political interests of the regime.

In Yugoslavia a political science association was formed in 1951.⁵⁴ In 1957-58 the Law Faculty of Belgrade University introduced changes in its curriculum designed to encourage the study of political science within the faculty, and in 1962 a faculty of the political sciences was founded at the University of Zagreb. Since 1964 the faculty has published a journal, *Političko Misao* (*Political Thought*), devoted to research and discussion of the field of political science. Currently, the four "High" (Advanced) Schools for the Political Sciences, which in the past have been responsible for training party cadres, are being reorganized into faculties with open enrollment. This step has already been taken at Sarajevo, where a faculty of political science—which includes in its curriculum the study of sociology—has been in operation for several years.

Instruction in political science in Yugoslavia is less concerned with indoctrination and more directed toward political education in the broadest sense. The faculties of political science specialize in training for careers in public service; many of their graduates can be found in positions, such as radio and television, which require a general familiarity with politics. Presumably these faculties will become an even more important training ground for persons filling politically sensitive positions as the party schools are closed and all or part of their student body transfers to the political science faculties.

⁵² For the official attitude toward the social sciences in East Germany, see the October, 1968 resolution of the SED Politburo, *Einheit*, December, 1968, 1455-1470. In Hungary, a recent article by the Director of the Sociological Research Group of the Academy of Sciences, Kalman Kulcsar, gave support to the idea of political science. Other articles have described empirical research on village councils, and on certain aspects of the legal system, being carried out by the Sociological Research Group and Legal Sciences Institute in Hungary. See *Partelet*, July, 1969, 36-41 and *Nepszabadsag*, May 31, 1969, 4-5.

The establishment of special faculties for political science in Yugoslavia has not been free of problems. At the University of Zagreb existing faculties resisted the change, while over-zealous proselytising for the new political science—"politologija"⁵⁵—led to controversy with political scientists from other institutions. Friction also developed between political scientists and the Party, which had insisted on approving the courses which the Zagreb faculty originally planned to offer its students.⁵⁶ In 1965 the faculty succeeded in reforming its curriculum in such a way as to reduce party influence over the teaching of political science. More recently the faculty incurred the enmity of the Party when its Party organization (made up of both faculty and students) sided with the liberally minded philosophy faculty in support of student demands during the June, 1968 demonstrations at the University of Zagreb.⁵⁷ One consequence of this incident has been new demands from the party for reorganization of the faculty's curriculum.

In Czechoslovakia, criticisms of the Stalinist method of studying politics and suggestions for the development of political sociology appeared as early as 1963.⁵⁸ A Czech political science association was formed and joined the IPSA in 1965. Following the publication of Burlatskii's views in the Soviet Union, articles were published urging the development of political science in Czechoslovakia.⁵⁹ While the Novotny regime never acted on these proposals, steps were

taken to enlist social scientists in the search for new approaches to the country's many political and economic problems. An Institute for the Political Sciences was established under the Party Central Committee to carry out research on the operation of the Czech political system. At the same time an interdisciplinary research team was formed under the Academy of Sciences to make recommendations concerning the future development of the political system in Czechoslovakia.⁶⁰

Prospects for the rapid development of political science, which looked bright after the removal of Novotny,⁶¹ suffered a severe setback as a result of the August, 1968 invasion. It need hardly be added that the prospects for future development of the discipline in Czechoslovakia now appear uncertain in the extreme.

In Rumania, a political science association was formed in the spring of 1968. Insufficient time has elapsed to permit evaluation of its activities. The wording of the charter of the organization suggests that it is to have a dual role, encouraging research and at the same time acting as an instrument for disseminating regime propaganda.⁶² The fact that the first chairman of the association is a politician,⁶³ rather than a political scientist, indicates that the Rumanian government is primarily concerned with the propaganda value of the organization. At the same time, articles in the press and scholarly journals have supported the study of political science in Rumania.⁶⁴ Conditions now seem favorable for at least limited moves toward initiating research and teaching in the discipline.

In the course of a decade, Polish and Yugo-

⁵⁵ The meaning of "politologija" is not entirely clear in Yugoslav literature. One position is that *politologija* is an approach to the study of politics designed to integrate existing fields of political science through the development of a comprehensive theory of politics. See Professor Geršković's views in *Politička Misao*, 2, No. 1 (1965), 145. The term often is used by Yugoslav political scientists simply to refer to the study of politics generally.

slav political scientists have produced a sizeable literature in practically all sub-fields of the discipline. This material can be broken down into two types: studies in political behavior, and work in more traditional areas such as comparative government, international relations, or political theory. While Polish political science has made its major contribution in the realm of political behavior, Yugoslav scholars tend to favor the more classical fields of the discipline. This difference is reflected in the political science journals of the two countries. The Yugoslav *Politička Misao* seldom publishes empirical studies of political behavior; *Studia Socjologiczno Polityczne* (*Studies in Political Sociology*), during the period of its publication the only Polish journal devoted exclusively to political science, was oriented toward political sociology.

Studies in political behavior date from the early 1960's when Western concepts and research methods penetrated into Poland and Yugoslavia. The result was a wave of interest and enthusiasm for political science. The latest techniques in interviewing, and in the assembling and interpreting of data were tried out. While the results were not always up to expectations, empirical research on Communist systems began to appear for the first time, while the political scientists themselves, many self-trained, gained experience and professional skill.

In Poland, much of the research in the field of political behavior was initially focused on the study of community power structure.⁶⁵ Studies carried out in cooperation with the Party identified key decision-makers in Polish localities and gathered data on changes in the composition of the Party and the attitudes of Party members brought about by the post-war industrialization of Poland.⁶⁶

Polish political scientists have also been engaged in research on electoral behavior, utilizing data on the number of registered voters that participate in elections, the percentage voting for the government list, and the order in which the Polish voter ranks candidates on the ballot.⁶⁷

⁶⁵ This research is summarized by Winicjusz Narojek, *Studies in the Polish Political System* (Warsaw, 1967), 179-200 and *Studia Socjologiczno Polityczne*, No. 23, 1967, 29-43.

⁶⁶ Zygmunt Bauman in *Studies in the Polish Political System*, *op. cit.*, 13-32; see also his "Economic Growth, Social Structure, Elite Formation: The Case of Poland," *ISSJ*, 16 (1964), 203-16.

⁶⁷ Jerzy Wiatr, "Niektóre zagadnienia opinii publicznej w świetle wyborów 1957 i 1958 [Several Problems of Public Opinion in the Light of the Elections of 1957 and 1958], *Studia Socjo-*

The operation of local government has been approached through the study of political attitudes and values; in this work, Polish political scientists have cooperated with Yugoslav, American and Indian political scientists in a comparative approach to the study of political behavior at the local level.⁶⁸ Polish political scientists and sociologists have also conducted numerous public opinion polls, and sample surveys carried out by Polish social scientists have supplied extensive data on social stratification, modernization and related problems which have been utilized by political scientists.⁶⁹

The findings of these studies in political behavior have not always corresponded to official views and have at times underscored the problems facing Poland in a period of rapid social and economic change. Research into community power structure has confirmed the importance of small groups in the conduct of local affairs. Thus, Winicjusz Narojek, on the basis of data gathered in 1962, identified thirty-seven key persons in the power structure of a town of 30,000, thirty-one in another locality, and so on.⁷⁰ Public opinion polls have on occasion indicated that non-Communist attitudes persist in Poland; for example, research conducted by Józef Koszek on the socio-political attitudes of the peasants pointed to the continuing importance of the middle-aged, better-off peasants as opinion leaders, and the political preferences of this group for the United Peasant Party over the United Workers' (Communist) Party.⁷¹ The analysis of elections, although obviously more limited in scope than similar studies conducted in the West, has suggested the existence of variations in attitudes toward the regime both on a regional and class basis. Jerzy Wiatr's studies of

the 1957 election, moreover, showed the widespread popularity of non-Party over Party candidates, when a choice between the two was possible.

Research in political behavior has developed more slowly in Yugoslavia than Poland. As a consequence it sometimes lacks the professionalism of Polish works. Nevertheless, valuable studies have been produced by Yugoslav political scientists and sociologists. This applies in particular to the work of the Institute for Sociology and Philosophy at the University of Ljubljana. Pioneering research has been conducted by members of the Institute in the field of informal decision making.⁷² The results of this work parallel the findings of Polish political scientists on community power structure in Poland, pointing to the existence of informal centers of power at the local level. Public participation in local government and in meetings held for the purpose of choosing candidates for elections has been studied extensively;⁷³ information gathered by the Slovenian group has pointed to public distrust of the bureaucracy and Party as a factor limiting the democratic character of these institutions.

With the exceptions just cited, Yugoslav research on political behavior has not provided an accurate picture of the Yugoslav power structure or the actual manner of operation of self-management and self-government organs. The functioning of the Party is rarely studied from an empirical viewpoint.⁷⁴ Studies of workers,

⁷² Janez Jerovšek, "Neformalne strukture odlučanje na nivou općine [The Informal Structure of Decision Making at the Level of the Opstina]," *Sodobnost*, 12, No. 12 (1964), 1183-94. See also his "Distribucija moći na nivou općine [The Distribution of Power at the Level of the Opstina]," *Teorija in Praksa*, 2, No. 4 (1965), 652-64, and "Uticaj socijalne diferencijacije na strukturu moći na lokalnom nivou [The Influence of Social Differentiation on the Structure of Power at the Local Level]," in *Zbornik promene klasne strukture savremenog jugoslovenskog društva* (1967).

⁷⁴ One pioneering work which provides selected data from a sample survey on the role of the Party in institutions of self-government carried out in the district of Kraljevo (Serbia) is Krsto Š. Kilibarda, *Samoupravljanje i Savez Komunističke Partije u Srbiji* [Self-Government and the League of Communists in Serbia] (1966).

councils and local governments, and also of public opinion and electoral behavior, have tended to be vague and less revealing than analogous Polish research.⁷⁵ Pressure groups have not been studied to any great degree, although their existence in Yugoslavia is recognized.⁷⁶ Public opinion polls, while they demonstrate familiarity with sample survey techniques, have often suffered from respondent bias.⁷⁷

Polls do, however, touch on political questions and from time to time reveal sources of discontent that exist within the Yugoslav political system. In a special study of student opinion carried out by the Institute of Social Sciences in Belgrade, "lack of self-criticism and modesty in life" were identified as the chief defects of so-

[*Self Government and the League of Communists: Results of a Sociological Investigation in the District of Kraljevo*] (1966).

⁷⁵ The vast literature which has appeared in these areas cannot be cited here in detail. Some of the best empirical data on workers' councils have appeared in *Sociologija*, No. 1, 1961, and in the work by Jože Derganc and Ana Cukova, *Delovna skupina v sistemu delavskega samoupravljanja* [Workers' Councils in the System of Self-Management], Institut za sociologijo in filozofijo, Ljubljana (mimeographed) (1966). The Institute for Social Sciences in Belgrade has published many studies in this area as well. An excellent monograph on the Yugoslav commune, which may well be the best empirical piece yet produced by a Yugoslav political scientist, is Eugene Pusić, "Area and Administration in Yugoslav Development," *ISSJ*, 21, No. 1 (1969), 68-82. For a solid discussion of the problems of public administration arising from the operation of the Yugoslav federal system utilizing concrete examples from Yugoslav practice, see Institut za uporedno pravo, *Podela normativne funkcije između organa različitih političkih jedinica* [The Division of Normative Functions Among Organs of Different Political Units] (1966).

⁷⁶ See Zdravko Mlinar, "Družbena struktura komune in problem oblasti [The Social Structure of the Commune and the Problem of Authority]," *Problemi*, 2, No. 13 (1964), 69-79; Milan Knežević, "Neformalne grupe [Informal Groups]," *Oslododjenje*, February 8, 1967, 5; Miodraga Dj. Zečević, *Društvene organizacije i udruženja građana u komuni* [Social Organizations and Associations of Citizens in the Commune] (1965).

⁷⁷ See for example, the poll taken in 1964 on national attitudes in Yugoslavia: "O aktuelnim političkim i društvenim pitanjima [On Immediate Political and Social Problems]," *Jugoslovensko Javno Mnenje*, Series A-3, 1964, 83-108.

cialist relations in Yugoslavia.⁷⁸ One of the annual polls conducted by the Institute of Social Sciences on current issues, asked, "What do you like least in Yugoslav society?" The majority chose "connections and familiarity," an allusion to the importance of political connections and influence in getting ahead.⁷⁹ In another poll, which asked whether the status of the Party had risen or fallen since the war, the 19.1% who answered that it had fallen gave as their explanation the "lack of moral character" of Party members, and the belief that anyone could become a Party member.⁸⁰

In Poland and Yugoslavia the study of the traditional fields of political science has also undergone significant change. Western authorities are now regarded as the single most important source of ideas in most sub-fields of the discipline. Although dogmatic works on government and politics continue to be published in great numbers, there has been a modest but steady flow of more serious studies aimed at incorporating the insights of Western political science into the study of Communist political systems.

Certain areas have received special emphasis. In Poland, local government institutions have been the focus of research since the late 1950's, when the Institute for Legal Sciences began a long-term project on the study of local government organs. The Institute's publication, *Problemy Rad Narodowych* (*Problems of the People's Councils*) has made a significant contribution to our knowledge of local government in Poland.⁸¹ In both Yugoslavia and Poland, the early 1960's were marked by an emphasis on the comparative study of Western political systems. These studies permitted Yugoslav and Polish political scientists to investigate pressure groups, political parties, and other political phenomena at a time when research on domestic political institutions was just getting underway.⁸²

Both Yugoslav and Polish political scientists have engaged in the comparative study of Communist political systems, although efforts in this field have slackened in recent years. Yugoslav interest in the subject was perhaps most evident in 1964, when a project on the comparative analysis of socialist systems was under consideration.⁸³ At the same time, Polish constitutional lawyers were looking at comparative problems of Communist systems from a more traditional point of view. The focus of their research was the role of the presidium of the national assembly and the constitutional position of the head of state.⁸⁴

The study of international relations has also been stimulated by the influence of Western political science. This is particularly evident in discussions of the theory of international relations, which now make considerable use of Western models.⁸⁵ At the same time, the increased inter-

est of Eastern European governments in Africa, the middle East and Asia has led to rapid growth of research on the problems of developing countries.⁸⁶ Eastern European scholars are nevertheless seriously hampered in their work by the virtual impossibility of publishing views not in accord with official policy. Although carefully researched and well-documented studies in the field of international relations have been published in Poland, Czechoslovakia and Yugoslavia, the analysis of foreign policy problems by Eastern European political scientists offers relatively little that is new or original.

It is clear that political scientists in Poland and Yugoslavia have had considerable success in introducing Western concepts into the study of politics. At the same time the results have often been disappointing to those involved. In Yugoslavia, political scientists are still experiencing great difficulties in carrying out research. Expectations that the study of political behavior would develop into a new field of major importance have not yet been realized, despite repeated efforts to remove obstacles to work in this field.⁸⁷ Political scientists representing a

traditional point of view have raised questions concerning the wisdom of quantitative methods and the utility of polling techniques; even Leo Strauss has been brought into the controversy in defense of the traditional approach.⁸⁸

Yugoslav political scientists are nevertheless individualistic, deeply concerned with gaining recognition for the discipline, and receptive to a wide variety of ideas. The young Belgrade political scientist Stevan Vračar aroused widespread interest in Yugoslavia and abroad in 1967 by proposing a modified type of two party system for Yugoslavia.⁸⁹ Professor Leon Geršković has championed the cause of "politologija" as a new approach to political science, although now in less strident terms than in the past.⁹⁰ The late Dan Gjanković was a sharp and knowledgeable critic of the federal system in Yugoslavia,⁹¹ and Professor Eugen Pusić of the University of Zagreb has made significant contributions in the field of public administration.⁹² Jovan Djordjević, one of the country's leading constitutional lawyers and now a member of the Yugoslav constitutional court, has for many years been an advocate of self-management and a greater role for parliament as a check against the abuses of concentrated power in Communist systems.⁹³ Younger political scientists and political sociologists such as Janez Jerovsek have been stressing the importance of changes brought about as the result of modernization and industrialization in Yugoslavia, and the need to bring political practices into harmony with these new conditions.⁹⁴

⁸⁷ One approach to the gathering of empirical data which has been tried on several occasions in Yugoslavia is the organization of joint research projects with foreign social scientists. While this enables the outside researcher to gather much valuable material, the impact on Yugoslav political science, measured in terms of published data, has not been significant. Differences have also arisen over the interpretation of the data gathered by international research teams of this type; an early and well known case is the research of the French sociologist, Albert Meister, on workers' councils. See his *Socialisme et Autogestion: L'Experience Yougoslave* (1964).

The problem facing Yugoslav political science is to translate its enthusiasm for the discipline into research results of lasting value. Many of the leading figures in the profession have produced impressive theoretical works grounded in Titoist political theory.⁹⁵ but as yet no major work has been produced on the actual functioning of Yugoslav political institutions. It has proven impossible to discuss contemplated reforms of the political system—at least in print—until action has been taken by the Party. Even then, most political scientists feel constrained to speak in guarded terms, and very seldom in opposition to official views.

The failure to produce critical studies of the Yugoslav political system is a source of concern to Yugoslav political scientists. Speaking in 1964, Professor Djordjević complained that

we still don't know the real value and real role of all these Yugoslav institutions; we still don't have one solid study of a scientific character concerning even one of the fundamental institutions on which we base not only the program but also the actual process of socialism.⁹⁶

Djordjević's criticisms gained major support several years later when Leon Geršković spoke out forcefully on the same problem, urging political science to develop a more critical approach to the study of the Yugoslav political system, examining its actual operation rather than dwelling on its theoretical principles.⁹⁷ This critical analysis of the state of Yugoslav political science, coming from the originator of the plan to create a new science in the form of *politologija*, is a sign of the growing maturity of Yugoslav political scientists as well as an admission of the problems the discipline must overcome in the course of its further development.

Polish political science has made important contributions to the discipline in the realm of empirical research and has also produced a number of valuable theoretical works in the realm of political sociology. In contrast to Yugoslavia, Polish research has been free, until recently, to

describe the realities of Party rule with surprising frankness. Polish political science also gained an advantage from the comparative orientation which political sociologists such as Zygmunt Bauman and Jerzy Wiatr brought to the study of political behavior. Zygmunt Bauman in particular deserves special recognition; his attempt to create a synthesis between Marxist and Western elite theories, and his critique of the modernization process in Poland, were significant contributions to the field.⁹⁸

At the same time the theoretical and empirical boldness of Polish political science has created difficulties for the discipline. The use of quantitative methods in studies of political behavior has been exposed to professional criticism and ideologically motivated attacks. Since the 13th plenum of the Polish United Workers' Party in 1963, the social sciences have been strongly castigated by Party spokesmen for their "value free" approach, and sociologists and political scientists have been accused of advocating the control of society by a managerial elite. The campaign against the social scientists reached its height in the fall of 1967 and the spring of 1968 when Polish liberals were everywhere under attack. A serious blow was struck against the political science profession at this time when Zygmunt Bauman was deprived of his chair in political sociology at the University of Warsaw⁹⁹ and several members of the editorial board of *Studia Socjologiczne Polityczne* were dismissed.¹⁰⁰ Over the protests of Polish political scientists, publication of *Studia Socjologiczne Polityczne* was then suspended.

These developments have been paralleled by the emergence of what might be called a "non-Western" research approach to the social sciences in Poland. In writings espousing such a view, criticism of Western research methods is coupled with a stress on the role of the nation and the state in shaping society, and preference is given to an historical approach to the social sciences in place of comparative techniques.¹⁰¹ Responding to the growth of nationalist elements in Polish political life, this view has given priority to nationalism over Marxism in its efforts to inject a new orthodoxy into the study of the social sciences. Political scientists were exposed to these ideas at the first congress of the

⁹⁵ Examples of this type of work are the immense and erudite work of Professor Jovan Djordjević, *Politički sistem* [Political System] (1967); Leon Geršković, *Problemi i perspektive razvoja skupštinskog sistema Jugoslavije* [Problems and Perspectives of the Development of the System of Assemblies in Yugoslavia] (1967); Radomir Lukić, *Ustavnost i zakonitost* [Constitutionalism and Legality] (1966).

Polish Association of Political Sciences in December, 1967.¹⁰² Jerzy Wiatr, in his capacity as president of the Association, set the note for the meeting by emphasizing the importance of national values in the development of the Polish political system, while at the same time stressing the positive role of the state in the task of constructing a socialist society.¹⁰³

The ultimate effect of such efforts to create a distinctive Polish political science is uncertain. A number of the papers presented at the 1967 congress reflected the continuing concern of Polish political scientists with the comparative analysis of contemporary issues, especially the effects of modernization on Polish society and the democratization of politics.¹⁰⁴ In any case, the discipline may find it difficult to regain its former momentum. A new publication, *Studia Nauk Politycznych* (*Studies in Political Science*) has been founded under the editorship of Marian Zychowski, known for his lack of sympathy toward liberal elements in the political science profession.¹⁰⁵ Even more disturbing is the decline of empirical studies in Polish political science. Except for articles appearing in the publication *Problemy Rad Narodowych*, the bulk of the data published today was gathered prior to 1964. If it is to maintain its position as leader and pioneer in the study of political science in Eastern Europe, Polish political science must open up new areas of research and tap new sources of information. This, however, will be no easy task under the conditions which now prevail.

CONCLUSIONS

The major accomplishment of Communist political science has been to raise the issue of an alternative approach to the study of politics, in which ideological and dogmatic attitudes are replaced by the objective and scientific study of political events. A number of Polish, Yugoslav and Soviet scholars have adopted as their own

the standards and literature of the discipline; their published writings often do not include even perfunctory references to Marxist-Leninist sources. Although this writing is not in most cases characterized by great originality—and indeed may be highly imitative of existing Western works—there are persons who have sought, within their own field of specialization, to deal with questions “whose answers are not known beforehand.” Given the nature and magnitude of the constraints they face, their achievement is all the more impressive.

Moreover, in several countries of the area (Poland, Yugoslavia, Czechoslovakia and the Soviet Union), the level of discussion and original research among political scientists is much higher than a reading of published sources would indicate. In papers meant for limited circulation within research institutes, in references to debates taking place at meetings of political scientists, and even in research topics assigned to graduate students, there is evidence of a much more vital discipline than the often cautious published materials reveal.

Recently, however, the ruling parties have become increasingly concerned about manifestations of revisionist thinking and of works which might be construed as critical of the regime. Although not always successful, attempts have been made to curb the development of political science. The conduct of research in Poland and Yugoslavia, always beset with difficulties, seems on balance to be suffering from greater restrictions now than in the early and mid-1960's. The CPSU, too, after its earlier interest in political science, now emphatically calls for “partiinost” in social science. Given these circumstances, the immediate prospects for the discipline are not encouraging.

There are, nevertheless, forces which continue to favor the growth of political science. Communist regimes remain sensitive to the need for expert advice and may seek out the assistance of political scientists in areas where they have special skills. At the same time, continued exposure to Western literature and association with Western scholars at international conferences may promote the acceptance of Western methods and concepts in the social sciences. Finally, it may be that the advocates of political science will be successful in persuading the Communist regimes that it is to their advantage to encourage the growth of a value free political science. The persistence and enthusiasm of those who have supported political science in the past have kept the discipline alive even in its most difficult moments; given favorable circumstances, they may yet prevail.

¹⁰³ *Trybuna Ludu*, December 21, 1967, 4.

¹⁰⁴ *Zycie Gospodarcze*, February 4, 1968.

¹⁰⁵ The first issue of the journal, which became available in 1969, provided a broad range of articles on such subjects as international relations, political theory and local government. Current publications and professional activities in the field outside Poland were well reported. At the same time, the journal was more ideologically oriented than its Yugoslav counterpart, *Politička Misao*. Zychowski, in his account of Polish political science, focused mainly on the contribution the discipline was expected to make to the “Fundamentals” course.

COMMUNICATIONS

TO THE EDITOR:

Below is a copy of a telegram sent on May 14, 1970 to President Nixon. The eight signatures on the telegram are those of the current President of the American Political Science Association, the President Elect and all past Presidents from 1964 on. In that year the Johnson Administration began the term of office during which the war in Vietnam clearly emerged as the deepest domestic crisis of this century. Those signing the telegram feel that as professional students of politics their special knowledge permits them to offer sound and objective advice for easing this crisis. The signers might be contacted individually for comment, and a number of them could be gathered on short notice for a press conference in New York City.

THE PRESIDENT
THE WHITE HOUSE
WASHINGTON, D.C.

TELEGRAM
MAY 14, 1970

Acting in our individual capacities as political scientists who are devoting their lives to the study of politics we are impelled by the present crisis to offer our considered professional advice for the quickest, most effective way of saving lives in Indochina and reducing strife at home. One course alone remains: an immediate and clear commitment to a rapid and orderly withdrawal of all American Armed Forces from Indochina to be substantially underway by December, 1970 and to be completed by July, 1971.

Karl W. Deutsch

Professor, Harvard University*

President, American Political Science Association

Robert E. Lane

Professor, Yale University

President Elect, American Political Science Association

All past presidents of the American Political Science Association from 1964 to the present, listed alphabetically:

Professor, University of California, Santa Barbara

David B. Truman

President, Mt. Holyoke College

*(NOTE: INSTITUTIONAL NAMES ARE FOR IDENTIFICATION ONLY)

TO THE EDITOR:

As a service in time of national crisis we undertook to conduct during mid-May a sample survey of opinion among American college and university teachers of political science. The preliminary results of the survey indicate that three-fourths of the respondents polled disapprove of the Administration's action in Cambodia, over four-fifths now think that it was a mistake to have sent combat troops into Vietnam, and two-thirds anticipate a constitutional crisis in the United States if the war continues at its present pace. There was also strong apprehension about the domestic repercussions of the war. Results in more detail follow below.

Drs. Allen H. Barton, James Guyot, Charles Kadushin, and Donald Puchala of Columbia University designed the survey and were responsible for the analysis. Questions were prepared in consultation with James David Barber, Yale; Richard Brody, Stanford; Seymour Martin Lipset, Harvard; Ithiel de Sola Pool, M.I.T.; and Sidney Verba, Chicago. Dankwart A. Rustow, Columbia, acted as overall coordinator. The poll was carried out by telephone on May 14 and 15, two weeks after President Nixon's announcement of the dispatch of American combat troops to Cambodia. Costs of the survey were underwritten in part by the Bureau of Applied Social Research, Columbia University, and in part from a grant by the Carnegie Commission on Higher Education to Professor Lipset for the study of "the politics of academe." Graduate students and faculty of the Columbia Department of Political Science acted as interviewers. Duplicates of the survey punched cards will be available at cost for further scholarly uses after full processing at Columbia and Harvard.

The random sample of 394 was drawn from the approximately 5,000 individuals listed in the Biographical Directory of the American Political Science Association (1968 edition) as full-time teachers or administrators at colleges and universities in the continental United States. Since all of them had attained their academic positions by mid-1967, when the questionnaires for the directory were filled out, they are at this point in time likely to represent overwhelmingly a senior and experienced group of scholars. Of the 394 persons in the sample, 286 were reached, and 265 agreed to respond.

The largest group of respondents (66 percent) identified themselves as specialists in American government, but some of this group as well as others in the sample (totalling 55 percent) specified added expertise in comparative politics and international relations. Sixteen percent of the

respondents polled reported Asian politics as one of their areas of professional interest. Most respondents were Democrats (66 percent) and Humphrey voters in 1968 (71 percent), while a considerably smaller group were Republicans (9 percent) and Nixon voters (12 percent).

Respondents polled were highly critical of the Nixon Administration's policies in Southeast Asia. Not only did three-quarters of the political scientists feel that U.S. troops should not have been dispatched to Cambodia, but an even larger group (84 percent) now consider that it was a mistake to have sent American combat troops to Vietnam in the first place. Among respondents who voted for Nixon in 1968 only a minority agreed with the move into Cambodia (44 percent in favor, 28 percent against, and 24 percent undecided). As many as 78 percent of the Nixon voters thought in retrospect that we should not have gone into Vietnam. A majority of the whole sample polled expressed skepticism that "the Nixon Administration's policies are likely to lead to a negotiated peace settlement"; at the same time, a similar proportion (71 percent) clearly rejected the Nixon Administration's assumption that immediate withdrawal from Vietnam would lead to American involvement in "a bigger war later." Sixty-four percent, or over, favored complete U.S. troop withdrawal from Vietnam during the next eighteen months. Only a minority (22 percent) of respondents felt that "the United States has a moral obligation to ensure South Vietnamese the right to choose their next government in a free election."

Other results of questioning regarding the Southeast Asian situation were more mixed. There was a division of judgment as to whether immediate withdrawal from Vietnam would lead to "large-scale slaughter of South Vietnamese"—31 percent agreed, 43 percent disagreed, and 25 percent were undecided. Neither was there any clear consensus as to whether a viable Vietnamese government could be obtained via the Administration's formula of troop withdrawal, Vietnamization of the war, and continued U.S. aid. Here 35 percent saw a viable South Vietnamese government emerging, but 40 percent did not, and another 25 percent were undecided.

The survey further revealed widely-felt concern about the impact of the war at home. Feeling on the domestic costs of the war was clearly evident in the avowal by 85 percent of the political scientists that the military conflict is preempting funds that should be devoted to dealing with pressing problems in race relations, the cities, and the environment. In addition, a large group of respondents (66 percent, with only 19 percent disagreeing) believed that a constitu-

tional crisis may develop in the United States in the event that the war in Vietnam continues at levels of intensity recently reached. An even larger group (86 percent) saw increased violence and polarization in our society as a likely result of the continuing war. Seventy-nine percent of the scholars interviewed feared that a continuation of the war will make it "increasingly difficult for educational institutions to carry out their function of education."

For reasons of moral and political responsibility, the undersigned are transmitting the results of this survey to the political science profession and the American public in the belief that the views of a professional group of experts on American and international politics ought to be widely known at this time (May 16, 1970).

MERLE FAINSON

ROBERT A. DAHL

ROBERT E. LANE

KARL W. DEUTSCH

DANKWART A. RUSTOW

DAVID EASTON

DAVID B. TRUMAN

TO THE EDITOR:

Professor Sheldon Wolin's assault on the nature and consequences of "methodism" in contemporary approaches to politics and political theory (this REVIEW, December, 1969, 1062-1082) was a welcome and on first reading a potentially valuable corrective to political studies which have, in their efforts to achieve a "value-free" stance, merely become bloodless.

I say "on first reading," because pondering Professor Wolin's recommendations for the civilizing of political education via the study of traditional political philosophy, I sense not only what I think are some serious mistakes in his view of political theory, but some positively distasteful implications.

The route of his argument seems roughly to be as follows:

- (1) Political education in the United States, to the degree that it is tied to formal education, has become "impoverished." "Methodism" in political science has deprived students of politics of the capacity to make theoretical discriminations which are of genuine political significance. Thus, we talk of "inputs," "system maintenance," "decision making," ignoring the textures of passion, justice, and anguish. The overall result is a political science myopically unable to provide attention to the more dire and threatening aspects of contemporary social-political developments in the United States.
- (2) What is needed is a wider pervasion of the ability to make "appropriate" theoretical discriminations. We need, in a word, the restoration of civic vision, the ability to concentrate

our focus politically on what is "politically appropriate," rather than the merely "theoretically operational."

- (3) A political education rooted significantly in the study of the tradition of political theory (Plato to Marx) will provide the antidote to the toxin of methodism. "Magnitude," the "public concern," and the willingness of traditional theorists to confront real problems in the real world, rather than to look for mistakes in theory when anomalies arise, all will help in the development of a "lore" of politics, in the achieving of that bedrock of "tacit political knowledge" so necessary to the making of sensitive political judgments.

Having finished reading Professor Wolin's essay I was left with a good feeling. I felt that a meaningful erosion of the sterility of much of modern political science had thus begun, that here indeed, was a calm and unhysterical voice arguing for a return to sanity in the study of politics. But, as if I had first only viewed the path of his argument from the air, my mood changed when I got closer to it, when I tried to traverse the same distances by the same route. What was a happy mood turned sourly to disappointment. At the very center of his argument he had built upon not merely a serious error, but an almost deliberate piece of obscurantism. As I tried to retrace his journey I discovered that a crucial bridge over the abyss had been destroyed by the corrosion of "tacit knowledge." The pivotal point in Professor Wolin's notion of how political theory can educate us is here in the accretion of our grasp of politics' supporting lore, tacit knowledge. "Political life," he writes, "does not yield its significance to terse hypotheses, but is elusive and hence meaningful statements about it often have to be allusive and intimated." (1070)

The argument is subtle. But the upshot is an almost occult sense of the mysteries of politics, the magic of insight and sensitivity, the alchemy of special, unarticulated wisdom. Consider the vocabulary of "tacit knowledge" that Professor Wolin employs—"elusive, allusive, intimated, sensibilities, civilized, connotative, appropriate richness, intellectually curious and broadly educated, intuitions, feelings, initiation, discriminating, cultivation, that sense of significance."

But this is a great deal more than merely cabalistic, it is also aristocratically snobbish. He is saying tacit knowledge, but it sounds strangely like that nineteenth century literary and artistic mask of Taste! I cannot dispel images of sensitive, melancholy young men, pensively poised, pen-in-mouth, seeking inspiration from delicate gardens and lacy virgins. It is the same sort of

facile solution to the same kind of difficult problem. And what makes Professor Wolin's piece finally so disappointing is that it is exactly at the hardest, most crucial point that he retreats behind this Victorian screen. How *really* could the study of Plato, Aristotle, Machiavelli, Hobbes, Locke, Rousseau foster in the twentieth century the political skills and refinements of judgment that he thinks are so necessary to inoculate students to the bacteria of systems theory and data gatering? That everybody doesn't read these theorists in quite the same way as Professor Wolin does could raise considerable difficulty. I could imagine a perfectly defensible reading of classical theory which would yield an awareness of the need for obedience to authority, a deep fear of disorder and a willingness to make serious sacrifices in the name of order, a belief in the justifiability of illusion and myth in the spreading of political lies, and an acceptance of the naturalness and frequent necessity of war and militarism. Certainly this is not the tacit political knowledge that Professor Wolin is seeking. And certainly these are not the things which are needed by the class of people likely to be reached by formal education. In the face of corruption, waste, desecration, war, international adventurism, etc. we need something else, something more. Although Machiavelli said he loved his native city more than his soul, he said that privately, in a letter. What he often said publically, in his writings, was something much less consoling. Professor Wolin has mistaken his own particular perception of the teachings of traditional theory for what others might learn. He has, moreover, taken it for granted that it is really clear not only what we should learn from the study of traditional theory, but also just what of this "tradition" we ought to study.

Some of the truly difficult problems of the study of political theory—the existence of and the nature of any tradition we might describe or posit, the problem of interpretation (what there is significant and why?) the *processes* of political education, the distortions inherent in beginning with the conclusion that there really is a history of the "working out of an inherited form, which is what a tradition is all about"—these things are all slighted by Professor Wolin. Perhaps some of these shortcomings can be attributed to his admirable sense of the seriousness of our political problems and the urgency with which we need to offset them. But, some of it has, finally, to be attributed to the implicit sense of aristocratic complacency and a kind of over-extended intellectual assuredness which hide from Professor Wolin just those very knotty problems which complicate the study of

political theory in particular and literature in general.

CHARLES D. TARLTON

State University of New York at Albany

TO THE EDITOR:

Before taking up some of the problems mentioned in Professor Tarlton's letter, I should like to enter one point of clarification regarding my exchange with Professor Dahl and a word of explanation concerning Professor Pool's communication.

In his original letter Professor Dahl had kindly included a reproduction of the specific passages from *A Preface to Democratic Theory* which were at issue in our discussion. I had assumed that the *Review* would include them along with his letter, but, unfortunately, it did not. May I suggest, therefore, that readers who may be mystified by my allusions consult pages 50-51 of Professor Dahl's work?

Professor Pool had communicated his objections in a letter to me (January 23, 1970). I replied to him at some length.

Professor Tarlton characterizes my essay as "an almost deliberate piece of obscurantism" whose "upshot is an almost occult sense of the mysteries of politics . . ." and an aristocratic snobbishness. It is not easy to reply to a charge of being "almost." If Professor Tarlton believes that the language which I used to describe tacit knowledge is evidence of a position which is "almost" like alchemy, magic, and cabalism, then he probably believes that most great creations of scientific theory, philosophy, literature, music, and art are rooted in occultism.

Professor Tarlton also charges me with arguing that the study of the major political theorists of the past will "inoculate students" against certain contemporary trends. If I had argued this, I would have been undercutting the point of my critique of "methodism." My basic position was stated in this form: "Appropriateness of judgment cannot be encapsulated into a formula." (p. 1077)

I would agree with Professor Tarlton's commonplace that "everybody doesn't read" the major theorists in the way that I might and that many of the assertions advanced by past theorists are objectionable or false. My position in these matters is not very startling: in reading past theories, students are not being asked to suspend their critical faculties but to extend them by scrutinizing the arguments and assumptions being systematically worked out by serious thinkers. The value of the activity lies in the awareness which is cultivated, an awareness of what sorts of problems have been regarded as political and of what is occurring when a theorist proceeds to develop a theory. As my

essay tried to suggest, most of the major theories have been designed to destroy and to innovate (p. 1079) and hence the student has the opportunity of observing minds in disagreement and of deciding for himself.

I would also agree with Professor Tarlton that the notion of tradition presents difficult problems for the study of political theory. Most of my work has been concerned with these problems. It remains unfinished.

SHELDON S. WOLIN

Center for Advanced Study in the Behavioral Sciences

TO THE EDITOR:

In the December issue of APSR, Sheldon Wolin in his article "Political Theory As A Vocation" talked about the "embarrassments" that are recognized "when it is asserted that a supposedly democratic system requires a certain measure of indifference or apathy, especially on the part of the poor and uneducated." As an illustration of that viewpoint, he cites a quotation from me in which I point out that "in the Congo, in Vietnam and in the Dominican Republic" the restoration of order does require imposing a measure of passivity and defeatism on newly mobilized strata.

It is hard to understand how the list, the Congo, Vietnam and the Dominican Republic, could have been interpreted by Prof. Wolin as examples of democratic systems. Clearly, what they represent, on the contrary, is countries undergoing the turmoil of civil war. Indeed, in two of those countries, the Congo and Vietnam, neither side could properly be called democratic. To me, it seems fairly obvious that what I was trying to say was that where people have become so aroused politically as to be openly killing each other, order depends upon somehow demobilizing these participants in the turmoil and inevitably involves a certain measure of defeatism for those who find that their apocalyptic goals failed to be achieved. Had I been talking about democracy rather than about civil war, what I might have said was that "order depends on somehow stimulating newly mobilized strata to acquire a measure of political participation and a sense of efficacy to which they have not been adequately aroused by the ordinary processes of modernization." In short, a sentence about democracy would have said almost exactly the opposite of the sentence that Professor Wolin quotes.

ITHIEL DE SOLA POOL

Massachusetts Institute of Technology

TO THE EDITOR:

Alex Inkeles' article, "Participant Citizenship

in Six Developing Countries" raises some distressing questions about the comparative study of development and modernity. The avowed purpose of his study is to obtain a cross-culturally valid concept of modern man. Despite his apparent wish to avoid the stigma of being "culture bound" in his approach, I wish to emphatically point out that the conception and execution of Prof. Inkeles' study is just that.

It is curious that Prof. Inkeles offers no justification for selecting an exclusively male interview sample—cannot women be modern? Why is the study interested only in the male as a participant citizen?

The totally indefensible assumption that only men are relevant in the modernization process belies an incredible blindness to the crucial fact that in those countries in which there is an all-out drive towards modernization: i.e., bringing individuals into political participation, the emancipation of women is regarded as a key to changing the social, economic, and political, consciousness of both men and women. It is hardly a coincidence that the status of women has altered most drastically in those countries which have and are exerting the most effort to develop and change individual consciousness. May I cite China, Russia, Cuba, and Israel?

Unless American political scientists—who are predominantly men—cease regarding women as "persona non politica," the comparative study of modernization will continue to produce results which are less than fully valid.

SHELAH G. LEADER

State University of New York at Buffalo

TO THE EDITOR:

Dependent as she was on the limited account I could give in a journal article, Mrs. Leader misconstrued my purpose and mistakenly projected on to me views I do not hold.

Our main purpose was to test the effect of a limited number of independent variables, particularly education and factory experience, on the process of individual modernization. We designed our samples to have maximum variability on these dimensions. Given limited sample size this restriction meant we could afford only minimum variability on all other dimensions. We therefore excluded not only women, but all men over 32; all ethnic and linguistic groups except the predominant one in any region; all people working in factories with less than 50 employees; all individuals having higher education or holding managerial jobs. What theory of prejudice will encompass this array? It is true, of course, being obliged to limit ourselves to one sex did not require us to exclude women. Why not exclude the men? The reason was that in the developing countries we studied there were very

few women working in the factories. In short, the exclusion of women from our sample was dictated by our sampling frame, and reflected no judgement about the importance of their participation in politics.

In fact, our views are quite the opposite of those projected on us by Mrs. Leader. The Harvard Project on the Social and Cultural Aspects of Development has defined individual modernity precisely in accord with Mrs. Leader's conviction that the emancipation of women is a key to modernization. In our scoring system the interviewee gains points toward a higher score on our measure of individual modernity (OM) if he affirms that for equal work women should be paid wages equal to those for men; that women should be able to speak for their families with a voice equal to that of men; that women should, if qualified, be freely elected to the highest office of the land; and so on through numerous other issues. This hardly suggests that we believe that "only men are relevant in the modernization process."

ALEX INKELES

Harvard University

TO THE EDITOR:

In the December 1969 issue of the *REVIEW*, Professor Donald Hindley's discussion of my book, *The Broken Triangle*, raises an epistemological issue which I mistakenly had hoped had finally been laid to rest in the discipline: the place of systematic, replicable analytical techniques in handling limited—and hence manageable—research problems. One of the major purposes of *The Broken Triangle* is to provide historically trained area specialists, like Professor Hindley, with a demonstration that social science theories and techniques can provide new ways of ordering and analyzing the material which has been heretofore virtually the exclusive province of intuitive analysis. Hindley appears to reject the enterprise out-of-hand.

He begins by questioning the meaning of "national perception" and suggesting that the difference between *real* and *politically calculated* perceptions in dealing with data generated from authoritarian states render it a fruitless concept. He ignores completely, however, the fact that I have quite explicitly operationalized my definitions of national perceptions in terms of theme, media level, frequency, and intensity in dealing with Chinese sources (the study's primary concern) in a number of places in the manuscript, including pages 5-12 and 125-130. At the same time the specific utility of documentary content analysis is explained for handling the statements of totalitarian regimes. Professor Hindley dismisses the latter as mere "translation clippings," ignoring the criteria by which they were se-

lected. (Incidentally, to be logically consistent, he would equally have to reject much of the documentary source material—other than interviews—for his own solid, earlier studies of the PKI).

Throughout his review Hindley rejects the position that social science propositions developed from other data bases can be applied to the Indonesian milieu. I suppose the logical extension of this stance is that Indonesian behavior is not a subcategory of human behavior! For example, he dismisses the symbolic proposition on group behavior adapted from the careful studies of Mancur Olson on American and British group dynamics as an "appalling . . . simple mathematical equation." The truly appalling element, however, is not the attempt to see whether Olson's proposition may be of explanatory value in other group contexts but rather Professor Hindley's obvious and indeed prideful ignorance of empirical theory and technique in political science.

Hindley raises specific questions about the interpretation of events. This would be perfectly legitimate if he would offer alternative explanations to those presented in *The Broken Triangle*. In fact, he does not do so—merely asserting *ex cathedra* that the author's are in error. His objection to the lack of causal analysis in the discussion of the relationship between the PKI, Peking, and Sukarno escapes me completely unless it is a further product of Hindley's ignorance of causal theory. That is, the chapters on NEFO and the PKI could *not* show a *causal* relationship between Chinese intentions and PKI and Sukarno's behavior both because of data inadequacies and because the conceptual framework was not designed to develop such relationships. These chapters do demonstrate, however, the evolving complementarity of goals and values among these actors; for purposes of demonstrating conditions conducive to alliance formation, this should be all that is required.

I could go on to refute Hindley's specific interpretive objections point-by-point, but unfortunately this communication is not the appropriate place. (Should any of the Review's readers so desire, I should be happy to provide individual responses.) Some of these objections hardly merit rebuttal when, for example, Hindley enigmatically asserts that my depiction of Peking as xenophobic is based on personal prejudice. It is hard to believe that the evidence of Peking's international behavior in the course of the Cultural Revolution marshalled in the last chapter is merely a product of my "personal prejudice." Suffice it say that Professor Hindley's objections to *The Broken Triangle* have considerably reduced my optimism about the

growing propinquity between the Asian area specialist and general political science theory.

SHELDON W. SIMON

University of Kentucky

TO THE EDITOR:

Herewith my reply to Professor Simon's letter.

My review was of a particular book, not of the analytical utility for regional studies of advances in social science theory and methodology. Professor Simon's *The Broken Triangle* is as unencumbered with originality in theory-building as it is unembarrassed by knowledge in breadth and depth of its purported subject matter. As for innovative technique, Professor Simon employs the simple quantification of translation clippings. What I question at this point, however, is not the relatively low level of methodological sophistication being displayed, but the woeful inadequacy, in extent and reliability, of the resource base to which the quantification is applied.

One may, of course, borrow theoretical propositions developed in one context and apply them usefully to another. Professor Simon does not. He refers to my unflattering reference to his application to an Indonesian situation of a mathematically-expressed proposition loaned from Mancur Olson. My objection is not to the borrowing as such, but to Professor Simon's failure to use it as the springboard for a tenable, explanatory hypothesis. His shallow and often incorrect information on the politics of China and Indonesia, combined with a paucity of imaginative creativity, lead inexorably to hypotheses that range from the risible to the aggravating. In the instance cited above, it is sufficient here to note that Simon does not present, nor can he from the limited sources at his command, any evidence that the PKI members did in fact withdraw their support from the party. That is, he presents an hypothesis of dubious value to explain a development whose occurrence is, to say the least, in doubt.

Professor Simon courts disaster from the start by failing to establish ("operationalize") an analytically serviceable definition of "national perceptions," the central focus of his study. Perception has a common usage, even if translation clippings from dictatorial regimes are inadequate data with which to distinguish true perceptions from those that are publicly stated but politically contrived. But what constitutes the nation? Even if it is defined as the topmost political elite, *The Broken Triangle* fails signally to expose, let alone explain, the diversity of the Indonesian nation during the period of Guided Democracy. Professor Simon and his uninformed

readers are thereby left unprepared for the post-1965 leaders, whose perceptions are very different from those he attributes to Sukarno's nation, and yet who were part of the Sukarno elite. Perhaps they should be condemned as un-national.

Both Professor Simon's letter and a second reading of *The Broken Triangle* confirm a degree of ideologically-based prejudice that damages even further the value of his interpretive guesses. It is prejudice and not scholarship, for example, that evokes the conclusion that China's leaders are xenophobic. No persuasive evidence is presented. The incompatibility of Maoism and xenophobia remains unexplored. But Professor Simon is not overly concerned with fact when characterizing those who oppose the policies of the United States: most notably Sukarno, the PKI and the Dullesite version of the Yellow Peril.

Prejudice, a pitifully inadequate resource base, pedestrianism in theoretical and methodological application, and a failure to establish analytically viable definitions of fundamental concepts do not lead to interpretive hypotheses that are plausible. Nor do they lead to hypotheses that are implausible but stimulating.

In short, Professor Simon has failed to achieve what he set out to do: to discover the *real* values and perceptions of the actors; the *real* goals and the techniques applied to achieve them; the sources of those values, perceptions, goals and techniques; and the interaction between Indonesians and Chinese.

As a reviewer I am required to criticize fairly but severely an endeavor of this caliber.

DONALD HINDLEY

Brandeis University

TO THE EDITOR:

Numerous grave errors mar the article by Richard Ashcraft ["Locke's State of Nature: Historical Fact or Moral Fiction?"] in the September 1968 issue of this REVIEW, but for the sake of brevity I will limit my comments to the two most serious of them:

1. Ashcraft uses as the basis of his central thesis a word—moral—that Locke never used in *Two Treatises of Government*.

2. Ashcraft never uses a word—self-preservation—that Locke used frequently and emphatically and described as "fundamental."

The result, as I will show, is a distortion instead of a clarification of what Locke meant by the state of nature.

1. Ashcraft's main thesis is that Locke's state of nature must be understood to have a moral aspect, and to buttress that thesis Ashcraft quotes extensively from Locke's writings. But

any reader can detect the weakness of Ashcraft's evidence by a very simple test (I mean *any* reader; no prior study of Locke is required): Examine all of the passages from Locke and their source as given in Ashcraft's footnotes: you will discover that *every* use of the phrase "state of nature" occurs in *Two Treatises of Government* and *every* use of the word "moral" occurs in some other writing of Locke, published or unpublished. Ashcraft does not provide even one passage in which Locke spoke of morality and the state of nature together. In speaking of them together, Ashcraft has joined together what Locke scrupulously kept asunder.

2. The second major error is a mirror image of the first. Ashcraft, in a lengthy discussion of the transition from the state of nature to civil society, never speaks of self-preservation. Locke, on the other hand, spoke of the "Fundamental, Sacred, and unalterable law of *Self-Preservation* for which they [men] enter'd into Society."¹ Ashcraft purports to explain Locke's account of the foundations of political society without discussing or even mentioning what Locke himself tells us is the fundamental basis of civil society.

From this shaky foundation, Ashcraft proceeds to assert (and he merely asserts; there is not even an attempt at demonstration) that the state of nature is, at least in part, a "moral fiction." (I pass over the astonishing fact that Ashcraft does not tell us what he means by "fiction.") Having "established" by mere assertion that the state of nature partakes of morality, he proceeds to assure us that the state of nature is not a state of war: "the fact is, for Locke, the natural condition of man is one of uncertain peace."² Now, the fact is that nowhere did Locke say that the state of nature is a state of peace, certain or uncertain. On the contrary, Locke described only civil society, the opposite of the state of nature, as a state of peace.³ What makes the state of war is the use of force (without authority) and, as Ashcraft rightly says, the use of such force may very well occur in the state of nature. Thus, by insisting on calling the state of nature a state of uncertain peace, but acknowledging the occurrence of force, Ashcraft is reduced to this scholarly nonsense: the state of nature is a state of peace except when it is a state of war. Ashcraft would be more consistent with his own argument, and Locke's, if he would say, simply, for Locke, the state of nature is a state of uncertainty, period. And the uncertainty of the state of nature is surely linked with Locke's silence about moral-

¹ *Two Treatises of Government*, II, sec. 149.

² P. 902, column 1.

³ *Two Treatises*, II, sec. 212.

ity and his emphasis on self-preservation.

If we ask ourselves, then, why Locke did not mention morality in his major political book, whereas he spoke of it very frequently in much of his other writing, many interesting possible answers present themselves. One is that Locke did not equate the law of nature and morality (as Ashcraft does); instead, Locke equated the law of nature and self-preservation. He thus replaced a politics of morality with what might be called a "politics of self-interest." Locke did not go so far as to say that morality has nothing whatever to do with politics, but, even so, a comprehensive account of the origins and purposes of civil society that makes no reference to morality transforms our understanding of politics and of the rights and obligations of citizens.

The purpose of this communication cannot be to present a full interpretation of Locke's political teaching. I intend only to point out how Ashcraft's elementary errors of reading totally obscure the core of Locke's political teaching. Ashcraft used a vast collection of Locke's books and papers and drafts and correspondence, but he misread the one book before him.

ROBERT A. GOLDWIN

St. John's College

TO THE EDITOR:

I am fortunate that Mr. Goldwin's ability to misread has resulted in a short communication; Locke, unfortunately, has suffered more elaborately from this non-scholarship.

Goldwin says Locke does not use the word 'moral'; hence, it cannot be applied to the state of nature. Later, he even suggests that the Law of Nature and morality are not conjoined. In the simplistic fashion in which all this is gravely stated, one might also note that Locke did not apply the phrase, 'political theory' to his work. Should we therefore cease to regard the *Two Treatises* as embodying a 'political theory'? If the reader must take such nonsense seriously, let him consider, as Goldwin did not, what Locke means when he denies that men in the state of nature 'have an uncontrollable liberty' because 'the State of Nature has a Law of Nature to govern it, which obliges everyone' not to harm another.¹ It is the rule 'of reason and common equity' which 'God has set to the actions of men' and those who transgress it are to be regarded as 'evil' or 'noxious.'² If Locke is not talking about a moral standard, what is he talking about?

Goldwin's second point is even more obscurantist. I shall not try to imagine why he refers to the principle of self-preservation, but the reason Locke refers to it in the passage Gold-

win cites is that he is speaking of 'the preservation of the Community.' He refers to men *collectively*, as having entered society for self-preservation, and on this ground, Locke justifies the sovereignty of the community in the sentence immediately following the one Goldwin cites. "And thus the *Community* may be said in this respect to be *always the Supreme Power . . .*"³, i.e., the community always retains the right of self-preservation. Indeed, as Goldwin says, this point is 'a mirror image of the first;' it is precisely because the Law of Nature 'willeth the peace and *preservation of all mankind*' that the *community* does retain the right of self-preservation.⁴

Goldwin 'passes over the astonishing fact' that I did not tell him what I meant by 'fiction.' It is the second time he has 'passed it over.' Obviously, he did not read F.N. 14 (p. 900) in which I not only explain what I mean by 'fiction,' I also explain what Locke means by it. With a reader who will not read, what is one to do?

But it is not only that Goldwin does not read the text, Locke's or mine; a more serious difficulty lies in his methodological treatment of political theory. He imagines that when, *on the same day* that Locke is writing passages of the *Second Treatise*, he records in his *Journal* that it is 'every man's duty to be just, whether there be any such thing as a just man in the world or not,' (p. 906, n. 52) Locke neatly compartmentalizes his thought: 'morality' goes into the *Journal*, and amorality or immorality into the *Second Treatise*. If Goldwin has any specific evidence for believing that Locke consistently or inconsistently operated in this fashion—apart from his own imagination—we would all be interested in seeing it. For one so willing to pose 'simple tests,' this one should be easy to meet.

Perhaps when we refuse the name of scholarship to the kind of word play engaged in by Goldwin and others, political theory will cease to be the captive of those who would turn it into a new form of scholasticism. What we need to understand is the 'structure of intentions' of a political theorist, how his thought develops over time, and its relationship to the social and historical setting in which it arises. Only then can we begin to determine the relevance of 'traditional' political theory to our own lives and problems.

By the way, how is it that Goldwin purports to interpret my 'central thesis'? I never used that term in my article.

Political Thinking and Consciousness: The Private Life of the Political Mind. By ROBERT E. LANE. (Chicago: Markham Publishing Co., 1969. Pp. 348. \$6.95.)

Robert Lane's new book provides an interesting addition and counterpart to his earlier *Political Ideology*. The basic objective has remained the same—the discovery and explanation of regularities in the associations of life experience, personality needs, and political ideas—but there are major differences in method of data collection, type of respondents, and focus of inquiry. The data for the earlier analysis were obtained through interviews of fifteen adult members of the working- and lower-middle-class, the primary focus of conversation being the institutions and events that constituted the respondents' social and political environment. The data for *Political Thinking and Consciousness* come from essays of "ideological self-analysis," written by twenty-four college undergraduates, most of whom had middle- or upper-middle-class backgrounds.

Ideological self-analysis is an

... analysis of one's own political values, opinions, and beliefs, and the functions they serve in one's personality and life situation. It is an extended response to the questions "Of what use to me are my political ideas?" and "How did I come to have these political ideas?" (p. 16).

Self-analysis demands more of the respondent than interviewing, and while it provides better data for a study of intrapersonal dynamics than most interviews, the population with which this technique can be used probably is quite small. Lane's students, who, at least comparatively, ranked high in self-awareness and analytic skills, were given considerable coaching before they were thought to be ready to write the essays (cf. pp. 16–17).

From the parts of the essays that have been transcribed, it appears that most of the twenty-four students succeeded to a very substantial degree in their attempts to discover the developmental history and current functioning of their political ideas and to lay bare facets of the self normally shielded by complex defenses. The essays are frank in tone and richly textured in substance; they allow Lane to consider a great variety of propositions about the linkage of personality and politics.

Lane starts his analysis with an assumption: in ambiguous situations, that is, in situations where alternative cognitions about some matter

are available, *unrewarding* ideas will not be adopted, or retained, or utilized (p. 2). The status of this assumption is not altogether clear. Under a maximal interpretation of "rewarding" it can be taken as true by definition and hence empirically empty. More restrictive interpretations give the assumption empirical standing, but make it controversial. There is considerable evidence to show that not all human thought and action is reward oriented, whether one speaks of psychic gratification or of cognitive gain. In any case, once the assumption is stated it becomes clear what is to be taken as problematic, and the questions for Lane's inquiry reveal themselves: In what way is the idea rewarding? What needs influenced the adoption of the idea? What needs or motives does the idea satisfy presently?

For Lane, needs and motives are part of the personality system and constitute the "energizing sources" of political thought: "... human needs are the parents of social thought; the effort to gratify these needs or to reduce their urgency stimulates and shapes thinking" (p. 24). Lane's emphasis is on learned needs and motivations rather than on physiological needs. Informed in part by the thinking of Henry Murray and Abraham Maslow, Lane lists ten need syndromes particularly cogent for studies of political thought (pp. 31–46). The data permitted a treatment of the following of these: the need to be liked, the need to express and control aggression, the need to appear moral to the self and others, the need for social esteem and status, the need for identity continuity, and the need for autonomy.

The political ideas found in the twenty-four essays are the dependent variables in Lane's analysis schema. Arranged by Lane as "liberal" and "conservative" alternatives, the most important of these ideas concern: opportunity for all versus opportunity for the able; inclusive versus exclusive personal and social orientation toward minority groups; equality among nations versus emphasis of American interests and rights; belief in positive government versus suspicion of government; Capitalism as neutral versus positive symbol; greater acceptance of social change versus greater faith in the status quo; no identification versus positive identification with business (p. 52).

The connection between needs and ideas is forged by the dynamics of Lane's "model of a political 'idea machine.'" Briefly, a message or cue engages or arouses a need, stimulating

need-reducing efforts, which are shaped by a person's habitual modes of conflict resolution and strategies of defense, and which express themselves as a search for ideas to satisfy the need. This search is guided by various personality features, elements of belief systems, learning strategies, relation to reference groups and persons, definitions of the situation, and similar such matters (pp. 48-49).

Lane's model can be identified as belonging to a cluster of conceptual constructs, predicated upon the proposition that human thinking and action follow tension-reduction dynamics. Cross-pressure theory, balance theory, and cognitive dissonance theory are a few of the better known members of this cluster. Tension-reduction theories have dominated psychology and large portions of the social sciences for several decades. Their influence, however, has begun to wane. Critics have noted many unresolved conceptual difficulties and empirical work has produced important disconfirmations. There are weighty reasons to think that tension-reduction propositions are appropriate and useful only in the analysis of primitive stages or pathological forms of human development. It is doubtful that Lane's model provided the most advantageous orientation for his inquiry.

Lane's findings are many and cover a large substantive range; a comprehensive summary cannot be given here. Some of the findings add support to propositions that have become well accepted in political psychology, e.g., that personal insecurities and uncertainties can produce an intense need to be liked by others and/or to have power over them (p. 124); that hatred of one's father can give political thought an exceptionally aggressive quality (p. 163); and that the adoption of ideas and strategies of an "outsider" often is a consequence of damages to the self-image caused by bodily handicaps or other early deficiencies or disappointments (p. 228). Other findings are new or, in any case, throw light on propositions that have not yet gained general acceptance, e.g., that there is a causal link between fear of intimacy and bids for the affection of underdogs and outcasts (p. 117); or that "politically conscious upper- middle-class people whose aggression is inhibited solely by fear of consequences are more likely than others to be reactionary" (p. 173), whereas "those who are restrained in their aggression because of an other-embracing aggression anxiety, empathy with the intended victims, or guilt will tend to be moderate liberals or apolitical" (p. 179).

Lane, of course, does not take at face value all the facts asserted and beliefs and sentiments expressed in the essays. The students might not only wish to deceive the prospective readers of

their essays, consciously or not, but they also tend to "deceive themselves and often are out of touch with their own deepest needs" (p. 17). The analytic quest is for the hidden meaning and for the clues below the surface. But while the attempt to go to the hidden and refracted message is appropriate and necessary to the task, Lane leaves the reader severely frustrated by failing to specify the rules and standards that guided his non-face-value interpretations (for one of a very few exceptions see p. 262). The reader is given almost no opportunity to judge the validity of the interpretation criteria (the rules of evidence) or to inquire into the consistency of their application.

The feeling of frustration is increased by the fact that the essays are not reproduced in full, and that the selections from any given essay are scattered widely throughout the volume. This makes it impossible for the reader to gain the comprehensive and integrated perspective on each student which must have provided important contextual clues for Lane's interpretations of specific passages. When trying to assess the validity of Lane's inferences, the reader mostly is limited to asking whether the interpretations "make sense"—in terms of the selections that have been reproduced, or in terms of the concordance of Lane's conclusions with accepted theories.

If *Political Thinking and Consciousness* frustrates the reader, it also gives him much that is stimulating and challenging. Lane displays an uncommon understanding of the adolescent's struggle to come into his own; the findings and suggestions of the new book will be of interest to students of the socialization progress as well as to students of political ideology.

PETER W. SPERLICH

University of California, Berkeley

African Armies and Civil Order. By J. M. LEE.
(New York: Frederick A. Praeger, Inc., 1969,
Pp. 200. \$6.00.)

In the last few years, Africa has displaced South America as the continent on which takeover bids by military forces occur most frequently. Attempted coups d'état there have now become a monthly event. Their incidence defies prediction. Arab and Bantu nations have proved equally vulnerable. East and West Africa have both had to contend with the problem. Military uprisings have become common in both francophone and anglophone areas. One-party states have proved no more resistant than more pluralistic regimes. Coups have occurred because the rank and file desire higher pay, or because officers tire of "corrupt" politicians; because ethnic minorities resent the dominance of gov-

ernment by other groups, or because previously excluded minorities are now being recruited at the officer level; because military men are dismayed by the chaos of civilian rule, or because they wish to retain some measure of autonomy within an increasingly totalitarian order. Many mutinous units have sought no more than the redress of limited grievances within a continuing framework of civilian government; on other occasions, uprisings express the determination of the armed forces—or a critical segment thereof—to assert the primacy of military values in political life. Almost the only constant is the increasingly demonstrated fragility of civilian regimes amid such pressures.

Africanists have recently begun to take account of these developments. J. M. Lee's *African Armies and Civil Order* is only the most comprehensive and ambitious of a recent stream of articles, bibliographies, and books on the subject. Yet there were few indications of this outpouring a mere five years ago. Until, in late November of 1965, General Mobutu's decisive takeover of the Congo sent a spreading shock wave of coups through francophonic Africa, climaxed some two months later by the overturning of seemingly well entrenched civilian governments in anglophonic Nigeria and Ghana, political scientists tended to treat the intervention of African military units in civilian politics as the transient eruptions of aberrant bands of mutineers. Mesmerized by the dramatic efforts of political leaders to transmute primordial attachments into populist nationalism, they continued to focus their attention on the seemingly successful processes by which "integration" and "nation-building" were being achieved through transference of "charismatic" authority to constitutional regimes. A rather slight volume by William Gutteridge, together with a half dozen cursory survey articles in widely scattered French and English language publications, comprised the contributions of scholarship to the question of civil-military relations in Africa.

One might infer from this record that African soldiers played a negligible role in the life of their nations before 1966. The inference would be hard to sustain. African troops were serving under colonial commanders before World War I. The first modern nationalist army coup in Africa took place in Egypt in 1952. Five bloody years of almost unparalleled disintegration in the formerly Belgian Congo were triggered off by a mutiny of the armed forces on July 4, 1960. Between 1957, when Ghana became the first tropical African nation to obtain its independence from a colonial power, and January 1, 1966, military units in various parts of the continent rose up against the newly con-

stituted civilian authorities no less than sixteen times. Even when these uprisings were suppressed, they usually traumatized the regime and fundamentally reordered its priorities. Yet it is also true that the role of the armed forces in modern Africa has had few parallels in other parts of the world. The relatively peaceful and almost total division of the African continent among the European colonial powers obviated the emergence of large traditional sovereign armies. Throughout the colonial period, the primary function of the relatively small-scale indigenous armed forces consisted not of protecting the colonial borders against external aggression, but of maintenance of internal order. Their visibility on the world scene remained correspondingly low.

One of the anomalies of contemporary Africa is that the balkanization of the continent at the time of independence has hardly altered this role. Attempts to interpret the recent wave of coups in Africa as the working out of certain allegedly universal propensities of "the military mind" are thus misleading. African soldiers have only rarely confronted, even prospectively, the conventional battlefield. Nor is it particularly helpful to view the armed forces, by analogies derived from other continents, as the representatives and/or protectors of determinate class interests. In countries where over ninety percent of the inhabitants are independent cultivators of small-scale plots, the apparatus of government is still the almost exclusive allocator of class status. African military leaders have indeed been interested in the pattern of their governments' distribution of scarce resources. But to say this is to redirect attention from the isolated compositional properties of the armed forces in Africa to the nature of the political regimes with which they are currently seeking to define their relations. It is the special merit of Lee's work to have pursued unstintingly the implications of this perspective.

The important questions about African armies today are ultimately, according to Lee, questions about the extent to which civil disorders on the continent spill over into the armed forces and involve them in the political conflicts of the larger society. One illustration of this perspective arises from the British colonial policy of recruiting indigenous army personnel from the less westernized, less well educated tribes on the dubious supposition that such troops would at once retain a more martial spirit and prove tractable to military discipline. This created, in Kenya, a predominantly Kamba officers corps that could be relied upon after independence to disassociate itself from the tense maneuverings of the larger Kikuyu and Luo tribes for ascendancy within

the government; in Uganda, a dependable ally for the Nilotic Prime Minister Milton Obote during his desperate struggle with Bantu cabinet ministers and royalty; in Nigeria, a complex stratification of the armed forces by generation and region that brought about a succession of coups and counter-coups within the army as ethnic hatreds surged to the surface elsewhere. When a single policy can have three such different outcomes, it follows that the composition and internal dynamics of the military structures in question become significant primarily in relation to the civilian sector's ability to cope with the ethnic tensions of the nation. A practical corollary is that, as Lee observes, the more an African government seeks to make its officer corps representative of the new nation, the more it makes its army vulnerable to complete collapse if the coalition of interests in the civilian order also breaks down.

Lee's book is consequently more than a monograph on African armies; it is, in fact, an interpretive essay on the politics of tropical Africa as the unifying drama of independence begins to fade. The central characteristic of this politics, as Lee sees it, is one of intense competition for the scarce material and status rewards of public employment—a competition unregulated or only weakly regulated by any common normative conception of legitimate public authority. This "competition for jobs may often transform old conflicts between the different social groupings which claim access to the new state, and adds a new dimension of rivalry between generations" (p. 180). Although African armies have frequently sought to perpetuate their colonial tradition of standing somewhat apart from the overtly political branches of the government, they seldom succeed because not only the coercive resources at their disposal but even quite simply the stable employment they offer appears too tempting a prize to the contending factions within the new states. Since military officers themselves were conditioned to obedience to an external colonial sovereign in the era preceding independence, they have rarely exhibited any deeply rooted loyalties to the generally fragile successor regimes, and have proved correspondingly more accessible to the importunities of particularist groups. Hence despite the contentions of certain scholars that armies in the new nations are the natural conservators of a unified civic order, in tropical Africa "it looks as if the army is more likely to succumb to the influence of the values expressed by the political community, than to create and diffuse new concepts of national identity" (p. 113).

The exposition offered here can only hint at the important issues canvassed in Lee's densely

argued and richly suggestive work. Multi-faceted in its analysis, it is equally impressive for the scope of its coverage. Lee ranges freely and authoritatively throughout anglophonic and francophonic Africa, repeatedly drawing pertinent illustrations from opposite ends of the continent. Generalizations are derived not only from the inevitable cases of Senegal, Ghana, and Tanzania but also from Togo, Somalia, and the Central African Republic.

This synoptic approach predictably has its price. The familiar but critically significant efforts of Tanzania to forestall a second mutiny deserve more than the brief remarks Lee allots to this deviant case. The references to Gabon could well have been sacrificed to an analysis of the lines of continuing cohesion and cross-cutting cleavage within the Nigerian army that would have revealed the excessive ethnic reductionism involved in talking of "Ibo officers" vs. "North-erners." A seductive but methodologically indefensible aspect of Lee's procedure is that exotic illustrations often serve as a surrogate for a systematic survey of confirming and disconfirming instances. Readers familiar with conditions in Africa will sympathize with Lee's reference to the "fragmentary nature" of the available statistical evidence, but are likely to feel that a more ambitious effort could have been made to relate the data he presents to the patterns he elaborates.

It must be said, moreover, that Lee's style of presentation makes needlessly unmerciful demands on the reader. It reflects too well the chaos he describes. Topical sentences too rarely provide an organic clue to the concluding sentence of a paragraph. The logical intension of concepts frequently shifts within a page; suggestive analytic propositions and classifications are devised and as promptly abandoned, only to reappear several chapters later. Repeatedly, Lee accounts for a variance with an explanation that is either incomplete or apparently contradicted by something previously written; one then encounters the critical missing premise several paragraphs later. The result is that a 185 page book reads like one approximately twice that length—one is forever rereading a paragraph or shifting from page to page in pursuit of a tantalizingly permuting argument. Both author and editor have much to answer for.

Much allowance will be made, however, for the artificially foreshortened gestation period of such intensely topical themes. For all its evidence of hasty composition, Lee's study suggests important new questions, sharpens several that have been asked before, and explores them at length from a consistent and fruitful perspec-

tive. Given the almost daily flux of the subject matter, one could hardly have asked for so much so soon.

University of California, Santa Cruz

Power in Committees: An Experiment in the Governmental Process. BY JAMES DAVID BARBER. (Chicago: Rand McNally, 1966. Pp. 185. \$6.25.)

This book is unusual in at least two respects. As a systematic, empirical investigation of the process of committee decision-making, it is a welcome addition to an area of the discipline much in need of such research. As a piece of laboratory research, utilizing small-group concepts and methods, it is a distinctive and innovative work which is bound to receive critical scrutiny from a discipline largely unaccustomed to this type of research. From either standpoint, the book is a provocative and insightful piece of highly original scholarship.

It is Barber's concern with group processes and his perception of the difficulties involved in researching them in the natural setting which leads him to the laboratory. However, he is extremely skeptical concerning the value of trying to generalize from the findings of conventional small-group studies which typically involve naive subjects working on unfamiliar problems in an artificial setting. Barber perhaps states the case against such research too strongly, failing, for instance, to take account of the conventional defense of small-group research which asserts that *theory* is both the rationale behind apparent artificiality and the bridge between small-group findings and real-world phenomena. Nonetheless, his position leads him to attempt the fruitful innovation of bringing existing political decision-making bodies (Connecticut Boards of Finance), virtually intact, into the laboratory for observation.

Barber invited twelve Boards to the Yale small-groups laboratory to engage in two simulated decision-making tasks, which were designed to approximate the kinds of problems commonly encountered by such groups. The groups' behaviors were observed and scored according to the Bales Interaction Process Analysis system, and verbatim transcripts of the proceedings were also kept. Afterward, the participants completed a set of questionnaires and each group engaged in an evaluation session, which was also recorded. Barber did not attempt to conduct an experiment in the strict sense—the Boards performed identical tasks under identical circumstances. This fact points to a possible limitation in the general utility of his method, since groups lifted intact from their natural setting

inevitably bring to the laboratory their own particular internal structures and assumptions, which have an independent and unique effect upon each group's behavior. This introduces a source of uncontrolled variation in the groups' performance which could make it difficult to determine precisely the effects of an experimental "treatment" in the context of a controlled experiment. However, this presents no problem in Barber's design, and Barber has a plausible case when he argues that the gain in relevance from using "real" groups out-weighs any loss in experimental precision.

Barber's central theoretical concern is with power, both the power of the committee to perform its tasks and operate successfully within its environment and the exercise of power within the committee by individual members. In examining the first problem, Barber relies primarily upon verbatim transcripts, and his analysis, although not methodologically rigorous, is sensitive and insightful. In his discussion of the criteria employed by the Boards to sort their way through the complexities and uncertainties of budgeting, Barber makes an excellent contribution to the literature on incrementalism. His criticisms and suggestions for the "incremental improvement" of incrementalism are reasonable, if modest. Similarly, Barber's discussion of the power of the Board, in which he analyzes the contexts in which perceived power develops, strategies for enhancing power, and the relationship between contexts and strategies, is interesting and suggestive. These chapters may be best regarded as useful sets of hypotheses which warrant further testing.

In the succeeding chapters, Barber relies primarily upon the interaction process and questionnaire data. After showing that individual Board members' perceptions of the "power structure" in which the Boards operate are explainable primarily in terms of the individuals' self-images (certainly an interesting finding), Barber turns to the problem of power within the committee. His findings on the role of the chairman are substantially what one would expect on the basis of small group theory, but in a chapter entitled "Integration and Interaction" he produces some evidence which is not only important but sometimes surprising. For instance, he discovers that "there is apparently no relationship whatsoever between participation (frequency) and satisfaction" in the committees (p. 104), and that "there is apparently no relationship between rewarding experiences and integration" (p. 109). He finds norms of non-partisanship, impersonality, and unanimity important to the functioning of the Boards, and he finds evidence of substantial internal stratification and

role specialization. While these and other important propositions are not really integrated into a general theoretical framework, they are significant in themselves and should provide a good basis for further exploration in other contexts.

In his final analytical chapter, Barber factor analyzes 45 measures of interpersonal power. Each of the five major factors which results is composed mainly of slightly different measures of a single type of behavior or attribute. In operating inductively, Barber, perhaps unfortunately, declines the guidance of any formal theory of power. Nevertheless, the procedure does provide plausible evidence for Barber's contention that "power" is not a unitary phenomenon, but rather a set of phenomena which are substantially independent of one another or, in some cases, negatively related. Barber's attempt to explain his factors in terms of the possession of power resources produces numerous significant correlations but no very strong relationships. Interpretation of the findings in this chapter is difficult, but these data still seem well worth the attention of scholars concerned with the concept of power.

This book has some problems, including a lack of overall theoretical integration, despite conceptual linkages between the chapters. The presentation of data is not always as clear as it might be, and Barber's failure to perform significance tests on some of his data is puzzling. On the whole, however, as a basically exploratory effort, the book is a success. Barber clearly demonstrates the importance of paying attention to the internal structures and processes of political decision-making, especially at the small group level, and he shows the utility of laboratory research as one method of approaching this field. Hopefully this work will stimulate further investigations of its kind, both in laboratories and in field settings, and will not be disregarded as simply a curious, albeit interesting, piece of methodological heresy.

University of Minnesota

The Political Economy of Change. BY WARREN F. ILCHMAN AND NORMAN THOMAS UPHOFF. (Berkeley: University of California Press, 1969. Pp. 316. \$8.50.)

This book might be described as an almost flagrantly successful expedition in what has been called "economics imperialism," that is, the attempt on the part of economics to take over all the other social sciences. Its success is the more remarkable because neither of the authors are professional economists but rather political scientists. Nevertheless, they have taken the trouble to master what economics has to offer,

which is not always done in these cases, and the economist can find very little to complain about in the concepts and the theories which they have borrowed from him.

The success of economics imperialism depends on the fact that exchange, which is the central concept of economics, is a concept which can easily be generalized into virtually all other aspects of the social system, especially in its most general form of a transformation function, in which a certain quantity of A is given up and a certain quantity of B is gained. A and B in this case do not have to be commodities in the narrow sense of the word; they can be such things as the support of a particular sector for a politician, a sense of legitimacy which a regime creates, the capacity to do damage and to influence people by threats, and so on. It is, furthermore, easy to extend the concept of the transformation function into its limiting case of the one-way transfer, or grant, in which A is zero and B is positive or negative. It can also be extended to the concept of the threat, explicit or implicit, which may not, of course, be carried out, but remains as a potential transformation. If I do not pay my income tax ($-A$), I will go to jail ($-B$). One can argue very convincingly, therefore, that transformation functions and their more particular form of transformation coefficients (prices and shadow prices) underly all of social life, and indeed all systems of any kind, and as economics has specialized in the study of transformation functions of a particular kind in society (ratios of exchange), it is not surprising that the concepts and theories of economics have broad applicability.

We can see this in another form perhaps if we reflect that transformation functions which imply scarcity, in which A and B are of opposite signs, so that the more of A, the less of B, which are peculiarly the province of economics, extend over the whole field of social life, and it is again not surprising, therefore, to find that the principles of economics have very wide applicability. This reflection may also provide a clue, however, to the limits of economics imperialism, for transformation functions do exist which do not exhibit scarcity or conservation, in which for instance the more of A, the more of B. Teaching increases knowledge both of the teacher and of the student. An act of goodwill may increase the benevolence of both parties, as an act of illwill may increase the malevolence of both parties. With these kinds of transformations, economics is not at home, and the general theoretical structure which is based purely on economics is likely to miss them and their significance. It is not really a criticism of this book that its authors did not build the non-scarce transforma-

tion functions into their theory, for the object of the book is quite explicitly to apply the concepts of economic theory to political reality as far as it will go, and it goes a very long way. Nevertheless, the reader should be warned that economics cannot do everything, even though what it can do may be a large part of the field.

The book is so dense in content that it is difficult to summarize and though it is clearly written it is not always easy to read. Undergraduates, I think, would find it difficult, though graduate students in any field of social science would find it most rewarding. It begins with a justification for "political economy," as a new, or perhaps one should say, a resurrected science, and it ends with a plea for a new and a better Machiavellism for giving good advice not only to the sovereign or "statesman," as they call him, but also to the "anti-statesman," who may be more ethically desirable than the incumbent. The central chapters of the book deal with such problems as political resources, political exchange, political inflation and deflation, where incidentally the economic analogy often tends to break down, political resource management, political resource accumulation, and political administrative infrastructure. The political organization is seen as a kind of "firm" with the statesman making decisions in the light of his political exchange environment and also his political production environment. We see the statesman operating by inputs and outputs of both economic goods, threats, persuasions, charisma and what not. The authors are well aware of the great importance of legitimacy and legitimation and aware also that this is a quasi-economic good which can be produced and exchanged. They recognize in many places the limitations of the economic framework, especially as a result of the fact that in political life there is no single medium of exchange, like money. Hence, we have something which looks much like a complex barter economy which is much harder to reduce to simple terms and to measurement. This leads to some real confusions in the concepts of political inflation and deflation which clearly correspond to some sort of reality, but where the economic analogy is not very close because of the absence of any political equivalent of the price level. Nevertheless, the contrast which is drawn between regimes which have a deficiency of political demand, hence are lethargic and traditional, and those regimes where political demand is in excess and hence are unstable and chaotic, is a valid and powerful insight. The book is full of brilliant little "asides," like the comparison in the footnote on page 261 of the four Parsonian functions with the four "humors" of medieval medicine. The

attack on "general" theories of social change and development, like those of McClelland and Hagen, by comparison with the more particular and short-run theories, like those of Hirschman and Papenek, is very cogent.

This work is an important landmark in the development of an integrated social science, and everyone who reads it seriously will profit by it. It is perhaps a little unfortunate, in its illustrative material at least, that it concentrates so heavily on the problems of the poor countries and of development, because the principles which it expounds are of complete generality and indeed the applications to the rich countries may be of even greater interest. Perhaps the authors will consider this in the future. Whether the book fulfills its avowed intention, however, of developing a body of doctrine which will be useful to the "statesman," such as Colonel Gowan of Nigeria, may be doubted. The basic problem here is not so much the body of concepts and theory, but the problem of collecting and processing information in a form which is accessible to the "statesman." The authors recognized the problem, but also recognized that in the present state of knowledge they cannot do very much about it. Economics has been successful in influencing policy, not so much because it has developed an elegant body of theory, as because it has developed a technique—one might almost say a ritual—of information collection and processing which presents information to the "statesman" about the economy in a form which he can appreciate and act upon. Until political economy can do the same, one suspects that its actual impact on political behavior will be small. It is no great criticism of this book, however, to say that it does not go all the way. It has laid down the beginnings of a high road over very difficult country and its authors are much to be commended.

KENNETH E. BOULDING

University of Colorado

Integration and Disintegration in NATO: Processes of Alliance Cohesion and Prospects for Atlantic Community. BY FRANCIS A. BEER. (Columbus: Ohio State University Press, 1969. Pp. 330. \$10.00.)

Francis Beer attempts to analyze the processes of alliance cohesion in NATO in terms of a theory of integration. This approach provides an interesting addition to the great majority of literature on alliances in which theoretical considerations often are overlooked altogether. Even in the more theoretical work on alliances, the applicability of integration theory has largely been disregarded. Through an examination of NATO institutions the author seeks to

investigate the extent to which NATO has passed beyond a traditional alliance to become a political community. This transition is treated in terms of integration, defined as "the process whereby political actors in several discrete national settings are persuaded to shift their loyalties and political activities toward a new center, whose institutions possess or demand jurisdiction over the pre-existing national states." (p. 3)

In his theoretical introduction Beer suggests that movement toward an integrated political community will be indicated by an increase in institutional autonomy, the growth of authority, and increased legitimacy of the central institutions. He also suggests the hypotheses that integration will be more likely as: 1) alliance leadership combines ideological clarity in specific programs with ambiguity in abstract goals; 2) allied decisions are made jointly by independent experts and instructed national delegates; 3) coalitional support varies according to the issue in question; and 4) functional sectors tend to be technical rather than political in nature, so that spillover is more likely to result. Each of these relationships is then examined in great detail for five functional areas. The author chooses for this purpose political consultation, military forces, armaments, infrastructure, and science.

It is unfortunate that the author often loses sight in these detailed sections of his theoretical propositions, so that the theory serves more as an organizing scheme than as a set of hypotheses to be tested rigorously. The result is that the relationship between the detailed middle sections and the theoretical introduction is often drawn rather sketchily. As a detailed and comprehensive analysis of the development of NATO institutions, these interior sections are excellent; as a contribution to a theory of alliance cohesion, however, they fall somewhat short of the expectations generated in the introduction.

The author's general conclusion is that little integration has taken place in NATO in the 20 years since its formation. He finds that, while NATO has performed many useful tasks in all five functional areas, there has been little integrative spillover. This has been indicated by the lack of binding institutional procedures, limited task expansion, predominantly indirect authority, the lack of authoritative centers of decision-making, and the politicization of even technical functions, making spillover unlikely. Indeed, the only two factors contributing to alliance cohesion, Beer finds, were the ideological proclamations of NATO's leadership and the presence of external crisis. While all of these conclusions are quite reasonable and well docu-

mented, from a theoretical perspective the author's historical/narrative methodology makes it difficult to generalize these findings systematically beyond this specific case study.

In his introduction the author raises three criticisms of previous studies of integration, all of which tend to be contradicted somewhat by his own research. First, he argues that integration has been treated too often as a condition rather than as a process. Yet, in treating integration as a process, Beer fails to realize that process models are not necessarily uni-dimensional and one-directional. Spillover does not necessarily contribute solely to integration; indeed, *disintegrative* spillover may also occur. This point, which has been emphasized only recently by theorists of political development, needs also to be taken into account by theorists of international relations. Indeed, Beer's own analysis would seem to suggest that political disputes continually tend to be injected into technical areas of NATO organization. For example, French resentment of American domination of NATO, a political dispute, has undoubtedly contributed to French rejection of integrated NATO military forces and infrastructure, nominally technical issues.

In applying a functionalist model, Beer has failed to confront explicitly one of the fundamental paradoxes of functionalist theory. Functionalism assumes that integration is possible in technical areas because they are insulated from political conflicts; it then assumes that integrative habits learned in performing technical functions may spill over into political ones. But this then implies that the two spheres are not totally insulated or spillover would not occur. And if they are not entirely insulated, then political conflicts may even spill over to destroy co-operation in the performance of nominally technical functions. In short, there may be a reverse process of *disintegrative* spillover, and this seems to be what is appearing in NATO. A crucial task then, not dealt with in this book, may entail the identification of those conditions which may account for the direction of the spillover process.

Second, Beer charges that the importance of institutions has been de-emphasized, obscuring a great deal of the integrative process. While this is probably true to a degree, this may not have obscured as much as Beer assumes. Indeed, one conclusion that seems to stand out in his analysis is that somehow, in spite of the existence of a plethora of autonomous and differentiated institutions, NATO cohesion has declined substantially. Certainly this should suggest that a good deal more than institutions are relevant to alliance cohesion.

Third, the author contends that "there has

been a concentration on environmental configurations as causal factors and a neglect of the immediate motives and expectations of key political actors." (p. 3) Once again, several of his own findings seem to contradict this assertion. The one crucial factor which seems to account for the greatest change in NATO cohesion, according to Beer, is the degree of external crisis, an environmental factor. In his conclusion the author traces at some length the changes in NATO integration in relation to the degree of East-West conflict, and he finds that institutional advancement consistently tailed off during the periods of East-West détente in 1953-55, 1958-59, and 1963-65. Clearly perceptions of environmental conflict and the resulting tension appeared to have an integrative effect on NATO.

In addition, Beer finds that the ideology of NATO's leadership also tended to favor integration strongly. However, the minimal influence of these key political actors on the actual outcome tends to indicate their relative lack of importance. From this reviewer's perspective, one of the strongest points about the author's narrative was that it did *not* attribute all changes in NATO cohesion to one or a few key political actors, like de Gaulle, as so many other studies of NATO have done. In fact, he often seems to be quite aware that there are more basic factors, often environmental ones, at work. Thus, it appears to be essential to analyze the actors' environment and their perceptions of it as well as their own unique and idiosyncratic personalities.

In summary, Beer's book is certainly one of the most comprehensive and up-to-date analyses of changes in NATO cohesion during the past 20 years. It exhibits considerable substantive research effort and is organized in an interesting framework based on an analysis of the integrative process. Unfortunately, it has several theoretical shortcomings which illustrate rather clearly how far we are from a systematic, potentially generalizable, and empirically grounded theory of alliance cohesion.

P. TERRENCE HOPMANN

University of Minnesota

Gandhi's Truth: On the Origins of Militant Nonviolence. BY ERIK H. ERIKSON. (New York: W. W. Norton & Company, 1969. Pp. 474. \$10.00.)

When Erikson's *Young Man Luther* was published in 1958, it was little noticed by historians and social scientists, even by those who had special interests in the Protestant Reformation and rise of modern Europe (if memory serves, the book was not reviewed by This Journal or any

other political science publication). By now *Luther* has achieved almost classic status as a work of psychobiography, and indeed serves as a model to those attempting to apply psychoanalytic insights to history and biography. But Erikson's eminence goes far beyond the confines of academic departments in universities and the pages of *Daedalus*. Unlike many of his psychoanalytic colleagues who write for outside audiences, he is a prophet honored in his own country. His *Childhood and Society*, with its skilled delineation of the stages of child and adolescent development in different cultures, is among the most widely used books in psychiatric residency training programs. No wonder that for his contributions to the study of ego identity and identity 'crisis' Erikson was recently named by a large number of his fellow practitioners as among the three most outstanding living analysts and psychiatrists.

Gandhi's Truth is unlikely to lower these estimates; in fact, a case can be made that this latest book is superior in depth and relevance to the one on Luther. The focus of the work is a 1918 textile worker's strike—referred to by Erikson as "The Event"—in the Indian city of Ahmedabad. At the time of the strike Gandhi was almost fifty years old, and while he was already well known in India and abroad as a leader in the Indian civil rights movement in South Africa and in India itself, he was not yet the revered Bapu of the Indian masses he was later to become—or, from another point of view, not yet the "naked Fakir," as Winston Churchill, in his kindlier moments, used to refer to him. Gandhi was asked to mediate the strike by Ahmedabad's leading mill owner, Ambalal Sarabhai, whose sister was a social worker sympathetic to the striking textile employees. In the course of the strike, which was eventually settled by a compromise favorable to the workers, Gandhi converted a number of those on both sides to the principles of *Satyagraha*, a non-violent method of persuasion, according to Erikson, by which one's opponents are won over to the versions of truth, justice, and peace that are being put forward. By the end of the strike the techniques of *Satyagraha*, including for the first time fasting, had been more or less successfully tested, and a year later they were to reach and affect the stage of world history when Gandhi led the first nationwide civil disobedience campaign.

It was another thirty years before India saw the last of the British Raj, and perhaps India's achievement of independence in the late Nineteen Forties owed more to Britain's exhaustion following World War II and forces moving toward the dissolution of empires everywhere than

to Gandhi's *Satyagraha*. To take this direction further, it is possible to argue, as Arthur Koesler has recently done, that Gandhi's influence in India has been almost wholly reactionary and so backward, in terms of India's need for economic and political modernization, as to suggest that Churchill's "naked Fakir" designation was not far wrong. Erikson's interest, however, is less in modern Indian history or even in Gandhi's relation to Indian independence than in the possibility that *Satyagraha* may have momentous application to the increasing violent controversies of our own time. In promulgating and perfecting *Satyagraha*, Erikson asks in effect, did Gandhi know something that we in the West don't know?

Before turning to this question Erikson as psychoanalyst is concerned to explicate some important themes and occurrences in Gandhi's life prior to the 1918 strike. Gandhi's early years appear to have been more than usually complicated by oedipal relationships. Up to a point it is the familiar story of the male child's closeness to the mother and his rivalrous ambivalent and guilty feelings about the father. Even granting the point that these relationships should not be approached as if they had been lived out in Vienna or New York, it is reasonable to suggest that Gandhi throughout this life was more comfortable with the feminine side of his nature than with the masculine component. Erikson touches on this when he remarks that the "total image" of Gandhi's home in childhood "is one in which it is difficult to allocate masculine and feminine identifications"; "Father Time," he observes suggestively, is in India a Mother. Clearly in India the attributes of masculinity and femininity are not as sharply differentiated, and sexual role definitions as sharply marked, as in western culture. If I understand Erikson correctly, he wants to emphasize that Gandhi's acceptance of his own femininity and associated maternal instincts partly explains not only his success as a mass leader but also clarifies some of the necessary conditions for a world order based upon *Satyagraha* principles.

Gandhi himself, of course, is associated with a variety of bizarre sexual anecdotes, much used against him by his enemies. It is well known that he suffered life-long guilt as a result of having intercourse with his pregnant wife at the very moment his father was dying; some years later, after fathering several children and not wanting additional offspring (he was opposed to contraception), he renounced sex altogether. Or did he? Those opposed to Gandhi have always smirked about his habit in old age of sleeping with naked women and girls, allegedly to keep warm and to test his self-control. What-

ever the reasons, it cannot be denied that Gandhi throughout life suffered a good deal from demands made upon him as a husband, lover, and father. For his treatment of his sons, in particular, there is nothing to be said by way of justification. Perhaps it is a fair question whether, in this respect as in his failure to recognize the "mutuality" of sexual relations, Gandhi ever succeeded in practicing in private some of the principles of *Satyagraha* that he espoused in public. While Erikson does not raise such a question directly, it is with reference to Gandhi's treatment of his family that he abandons his customary affectionate regard for his subject, rightly scolding Gandhi for rationalizing his own behavior "with ambivalent phrases and principles."

Not that Erikson interprets Gandhi solely in terms of his complex psychosexual development. Indeed those who seek in the book a simple monocausal deterministic explanation for Gandhi's career will be disappointed to find that Gandhi's life as depicted by Erikson was not that simple. Erikson is content to demonstrate how certain themes from Gandhi's early years were played out in Durban, London, and, finally, Ahmedabad; beyond this, neither Erikson nor any other psychobiographer is really entitled to go unless he eschews the limitations imposed by the known available facts of Gandhi's life. Since Erikson is familiar with clinical realities, he knows that even these facts, like the manifest content of dreams, are subject to distortion, and he therefore is cautious in interpreting the 'facts' set forth in Gandhi's autobiography.

Some readers, no doubt, will think he is too cautious here and there, and perhaps it can be argued that certain interpretations evidence a considerable transference relationship between the analyst and his subject (Erikson admits to such a relationship with his 1962 host in India, the mill owner of 1918, Ambalal Sarabhai). The India experts among us will not be happy with his total ignorance of the social science literature pertaining to India, a literature that might have modified certain of his conclusions about the basis of Gandhi's charisma, and given greater depth to some other conclusions about the political and social significance of the 1918 strike. (Unfortunately, *Gandhi's Truth* illustrates rather than solves the problems presented when analysts with social science interests work in isolation from social scientists with psychoanalytic sophistication.) Erikson's writing style, which has always suffered from a conspicuous density and vagueness of expression, has not improved with this latest book, many paragraphs of which suggest that subtlety of thought and

phrasing if carried too far becomes merely another form of ambiguity. After much pondering I still cannot fathom the meaning of "Gandhi's actualism, then, first of all consisted in his knowledge of, and his ability to gain strength from, the fact that nothing is more powerful in the world than conscious nothingness if it is paired with the gift of giving and accepting actuality." One is tempted to wonder whether this sentence was intended to be understood. At other times, one suspects that a point made facetiously is designed to be taken somewhat seriously, and a point made seriously designed to be taken somewhat facetiously. Perhaps the author unlike the reader wishes to have it both ways.

These faults do not make *Gandhi's Truth* easy reading, but neither do they render its central themes so obfuscated as to elude meaning. Gandhi like Freud, Erikson suggests, understood the difference between ethics and moralism, and between what is instinctive and what is instinctual. Arguing an affinity between Gandhi's truth or *Satyagraha* and the insights of modern psychology, Erikson credits Gandhi with an awareness that man's propensity for destruction is an "unfunctional drive" that, because it is without preserving role, could be transcended or gotten rid of. Unlike most of us, Gandhi "prided himself on being half-man and half-woman," and Erikson is right to observe that wars owe something to the "age-old male propensity for considering the renunciation of armament an abandonment of malehood." Thus Gandhi, to whom the usual masculine-feminine dichotomies did not apply, was far more hopeful than Freud about the human condition, but like Freud understood the need for "mutual activism with others" in a non-violent context, and the achievement of "more inclusive identities." 'Reality testing,' Erikson seems to be saying, enables psychoanalytic man to think more clearly about himself and his problems, and may lead social man to the Gandhian solution of non-violent *Satyagraha* as a way of bridging the gap between personal and family ethics and the ethics of communities and nations. To choose any other direction is to choose certain death and the destruction of civilized life.

Would that it were so, that is, would that we were able to learn better from Gandhi than from Moses; Jesus, Freud, or, in our own time, Martin Luther King (to whom *Gandhi's Truth* is dedicated). But it seems that even the Indian followers of Gandhi have as little commitment to *Satyagraha* as the followers of Jesus have to the Sermon on the Mount. As this is being written there are reports of continuing communal strife between Hindus and Moslems in—one can

guess—Ahmedabad where the death toll may yet reach into the thousands. It is a sad commentary on the 100th anniversary of Gandhi's birth, and a pathetic footnote to *Gandhi's Truth*.

ARNOLD A. ROGOW

City University of New York

Nationalism and Its Alternatives. BY KARL W. DEUTSCH. (New York: Alfred A. Knopf, 1969. Pp. 200. \$5.95)

Among modern governments only nation states can—at their best—satisfy the needs and win the support of their inhabitants; but modern warfare makes those same states into "potential death-traps for their citizens." This "paradox" is the theme of Karl Deutsch's extended essay on *Nationalism and Its Alternatives*. He offers no panacea and preaches no sermon. Rather he seeks to contribute to a "political meteorology" that can provide timely "storm warnings."

The first three chapters trace parts of the global weather chart. In the West nations grew slowly along routes of transport and around administrative "core areas"; hence assimilation outpaced social mobilization. In Eastern Europe that ratio was reversed. Autocratic empires broke up into ethnic polka-dots. Internecine strife among nationalities led to expropriation, expulsion, and massacre—a wholesale disregard for human rights that cleared the way for communist repression. In the developing countries the nationalist and militarist rulers have shown themselves "spectacularly inept at economic, industrial, and educational development," and are venting their frustrations on the West.

Deutsch has only moderate hopes for federal integration among existing states (Chapter Four). Even in Europe, trade in the Common Market since 1957 increased no more than might be expected among any given group of growing economies. A more promising avenue is the formation of "pluralistic security communities"—groups of states that forswear war and hence can multiply their contacts through the flow of goods, news, and persons. Above all, Deutsch hopes for a concerted development of behavioral science (Chapter Five). Politics is like a game "with moderately loaded dice," a mixture of law and of chance. Hence it is amenable to techniques of analysis derived from probability, the theory of games, theories of imperfect communication, learning psychology, and other fields. And as understanding deepens, so do the opportunities for rational control expand.

Deutsch concludes that for the next eighty years or so there will be no substitute for the nation-state. Accustomed as we have grown to

its services we are not likely to settle for anything smaller—or for anything much larger. For with our present knowledge and habits, any substantial increase in size is likely to blunt a state's sensitivity to domestic needs and foreign dangers. Already the largest states resemble "irritable giants wearing blinders and defective hearing aids." We must therefore be prepared to give the nation-states "a larger part than ever of our material possessions and affairs . . . But we need not, and we ought not, give the nation-state our souls." Defense expenditures could be shifted toward indirect military assets such as transport, education, and foreign aid. International law could be developed not just as a moralizing law for international behavior but also as a pragmatic law of international behavior.

Deutsch's brevity and informal tone have their drawbacks. Future editions will no doubt eliminate some inadvertent inaccuracies or misprints. For example, Henry of Saxony was not a king who became emperor but a duke who became king; Greece became sovereign in 1830 not 1930, Germany federal in 1871 not 1918; Mustafa Kemal attained power in 1919–22, not 1918; and at the tenth step of a random walk the chances of being one step or less from the center are 672, not 712, out of 1024. (pp. 12, 49f., 118, 152.) Occasionally, too, a link in the argument appears to be missing. Would the Common Market economies have grown as much without the five year impetus toward unity provided by the Treaty of Rome? If boundaries once drawn turn people inward, is it still true that existing boundaries reflect (rather than restrict) present flows of communication? The analogy between international law and the rules of the road is less than convincing. Before the advent of unified government over long stretches of road, one might argue, there were no right and left lanes and no stop signs, and it was lurking highwaymen rather than "passing trucks" that were ready "to mete out the death penalty."

But the lucidity and succinctness of Deutsch's book more than compensate for such blemishes. For the political scientist, it draws together the major themes of his earlier works, such as *Nationalism and Social Communication* (1953), *Political Community and the North Atlantic Area* (with Richard W. Van Wagenen and others, 1957), and *The Nerves of Government* (1963). For the general reader it provides a convenient introduction to the body of thought that has made Karl Deutsch the leading political scientist of his generation.

Where others have escaped from the real political world into quantified trivia or abstruse verbiage, Deutsch has chosen for his life's theme

the patterns of communication that lead to political conflict—or cooperation. He attains relevance (that ideal loudly proclaimed these days, but rarely specified) in the two ways in which a scholar must pursue it: relevance to large human concerns and relevance to his own life history. Growing up in Prague in the period between the world wars within the small circle that was working for German-Czech understanding, Deutsch experienced the problems of nationality and communication as a daily reality. From Europe, too, he brought that rich knowledge of history which saves him from the pedantry and shallowness of much of American "behavioral" science. But it was his adoptive country that furnished the intellectual tools, such as cybernetics and the theory of games, with which to master his chosen problem.

Deutsch does not pursue the will-o'-the-wisp of a "value-free social science." He is aware that the realms of fact and of value are (in W. G. Runciman's phrase) "distinct but inseparable." His technological enthusiasm is pervaded by a deep humanism. His hopes for a better future are strengthened by an unflattering appraisal of the perplexities of the present. Inventiveness, he assumes, will do more good than high sentiment. He is keenly conscious of the ambiguity of all political situations. In particular, he knows that "Throughout the history of nationalism . . . we find the noblest aspects of life mingled with the most terrible." His most telling weapon against inhumanity and barbarism is the rationalist's gentle irony.

The central question of politics to Deutsch is not one of power but of the satisfaction of human needs. Mankind, he suggests, resembles "a tipsy, but reasonably rational," person "stag-gering along . . . the edge of a cliff." The social scientist cannot make us sober. But by examining both drunkard and mountain, he can lessen the chances of our stumbling into the abyss.

Columbia University

Community Conflict, Public Opinion and the Law: The Amish Dispute in Iowa. By HARRELL R. RODGERS, JR. (Columbus: Charles E. Merrill Publishing Co., 1969. Pp. 154. \$1.95, paper.)

This is a neat, tight little case study of an extended dispute over the schooling of Amish children. It is an interesting, sometimes absorbing account accomplished with considerable sophistication in data analysis. Although rough in spots, it is a useful contribution to professional understanding of relationships between local elites' attitudes and behavior and both local and general public attitudes, of the uses of legal machinery

for conflict resolution, and of the role of state officials in structuring local action. It could be useful in undergraduate courses in community politics or research design and methodology, as well as in some sociology of law contexts.

The dispute involved a community school board's efforts to force a handful of Amish children to attend local public school, or receive instruction in their two private schools exclusively from state-certified teachers paid for by the Amish community. The Amish sought to gain state support or local funds to pay uncertified teachers of their selection who would continue to instruct children according to Amish beliefs. Various means of enforcement were tried, and the dispute escalated to the point where the Governor of Iowa intervened to prevent physical coercion of the children. Ultimately, state requirements were amended to provide exceptions for the Amish, who emerged with substantially all their goals achieved.

Rodgers takes as his central questions (1) What type of circumstances lead responsible officials to refuse to enforce the law through the use of established legal machinery? and (2) What effect does such a refusal have on popular support for the law and the political system? Data collected for the purposes of the study included responses to similar structured questionnaires from twelve local "decisionmakers" (school board members and school officials), seventeen local "opinion leaders" (those named by decisionmakers as people they consulted), and a random sample of 289 local citizens (conducted by a professional survey organization). Some comparative data are also employed, the most useful of which are responses to a statewide survey which included some of the author's questions regarding the dispute and responses to standard attitudinal questions administered to another statewide sample by other researchers.

Rodgers finds that all segments of the generally conservative local community were agreed that the Amish should be obliged to obey the state school law requirements that they either attend public school or hire and pay for certified teachers in their own schools. The statewide general public, however, perhaps influenced by a dramatic photograph showing Amish children fleeing through cornfields from the pursuit of authorities who sought to force them into buses for transportation to public schools, favored exception to the law for the Amish. In what constitutes one of the most interesting findings of the study, Rodgers shows that the nature of the dispute was understood quite differently by different publics: local decisionmakers and opinion leaders saw it as a financial issue in which the Amish were simply unwilling to pay for their own teachers; the local public saw it as an

Amish attempt to avoid contaminating contact with the outside world; and the statewide public saw it as an issue of religious freedom for the Amish.

Decisionmakers felt strongly that the law should have been enforced as it stood, and they were aware of support for their position on the part of local opinion leaders and the local public. But they were reluctant to take the harsh final steps that the dogged Amish resistance made necessary, such as confiscation of Amish property, extended jailing of parents, or daily physical coercion of the children. All three local publics resented "outside interference" and continued to feel that the law should have been enforced, even though the Governor's intrusion took them off an uncomfortable hook and resulted in provision of special (non-local) funds to pay the Amish teachers' salaries. Only the two groups of local elites felt afterwards that respect for law had been undermined, however, while the local citizens' respect for law and the political system remained high.

The author deserves credit for tackling the difficult task of exploring the complex bases for noninvocation of legal machinery and the consequences thereof for future respect for the law on the part of various publics. On the whole, he does well in extracting hypotheses for future research. The scope of the problem, however, in contrast with the limitations of the data available, make the reader somewhat uneasy at points. The small size of the elite publics and the narrow focus on the process of a single rather unique dispute in this small community make for an uncertain base, and too often the author is forced to depend on answers to a single question to support broad characterizations.

To some extent, these are problems inherent in any small-scale research project which seeks to grapple with important problems. But the author has contributed to the difficulty here in some minor ways. Seeking efficient portrayal of comparisons between publics, for example, he employs bar graph presentations of group means to such an extent that the substance of responses are slighted, seriously so in one chapter (5). Nor does the conceptual armory of systems analysis seem well suited to the explication of the single chain of events and reactions involved in such a case study. The strengths of systems analysis are perhaps more visible in the design of research, or in interpretation of patterns of repeated behavior or recurring similar events. Here, the tale might have been told more clearly and directly if the author had not presented his findings in such an elaborate framework. And he might have avoided such minor annoyances as translating theoretical assumptions into "conclusions" for which his evidence offers little support

(e.g., p. 118.)

It is not inconsistent to add now that the author might also have sought to draw some implications of a different order out of his research; his central questions do not appear to wholly encompass the data developed. Part of the strength of this book lies in the multiple applications of the data, particularly those on the segmentation of attitudes within the community. In other words, this is more than a study of why the school board failed to go all the way with law enforcement and how various publics reacted in terms of support for the law. There are suggestive data permitting comparison of local elites and publics as to their relative propensity to make policy-preference-oriented exceptions to the neutral and consistent application of the law. In important ways, it appears, law is merely an extension of values, rather than an embodiment of a generally shared community desire for order and predictability. Support comes from those people whose preferences are served, and to the extent that they are; others, recognizing that the law embodies somebody else's preferences, prefer exceptions to allow them to do as they wish. There are interesting data comparing local elites and public attitudes on civil liberties questions which seem to show much smaller disparities than most other studies. And there is a series of implications for such policy questions as decentralization of decision-making: the data grant small encouragement to those who would see decentralization as a means of promoting local democracy, if democracy be defined to include the tolerance of strongly-felt minority preferences by local majorities.

These minor rough spots do not really detract from what is a decided professional contribution to the community politics and law-as-social-process literature. In addition, the book may offer a potentially useful classroom tool for teachers who want undergraduate students to learn research skills and concepts through field research in community contexts. It is well written, and the inclusion of timely anecdotes and revealing quotations enhances the impact. A description of the citizen sample, copies of the questionnaires, and descriptions of scale construction and computer programs and statistical techniques appear in appendices. All in all, it is an engaging and promising piece of work.

KENNETH M. DOLBEARE

University of Wisconsin

Men And Citizens: A Study of Rousseau's Social Theory. BY JUDITH N. SHKLAR. (Cambridge: Cambridge University Press, 1969. Pp. 245. \$8.50.)

Rousseau is truly the sphinx of modern social philosophy. Any student of the human condition

eventually encounters this sensitive and agonized genius, but the product of this encounter more often than not is a sense of paradox. One could say that he has been given a complex riddle to interpret. Many have been the interpretations proffered, and we now seem to have come full circle, in a way. Not long ago a prominent view of Rousseau was that he adored the noble savage, undefiled by exotic and corrupting arts and science and by any sort of government. Soon, however, scholars like Lovejoy perceived that Rousseau specifically denied that men could return to that condition, or even that it would be desirable. Before long our attention was being called to the profound rationalism and moral responsibility, revolutionary in character, of Rousseau's democratic political theory, and we were reminded of how highly Kant thought of him. We were then treated to a debate, whether he was totalitarian or democratic. What we now have from Mrs. Shklar is a denial of the significance of most of this argument through a sophisticated reversion to the negative aspects of the earlier thesis. To Rousseau, it is now said, there is no return to that happy past, but there is little happiness for men in the future, either. Man is indeed "born free" and "by nature good," but he is incurably fallen. Her argument is as fascinating as it is unexpected.

Robert Derathé warned us about twenty years ago that Rousseau could be understood only if all of his writings, including his letters, are considered, insisting with Rousseau that his thought would then show a consistency not otherwise discernible. Dr. Shklar has taken this advice to heart, but the consistent meaning she finds is not at all that found by Derathé. Whereas the French scholar, like Cassirer, concluded that Rousseau was basically a rationalist, and with elaborate documentation situated his thought in the context of the political science of the age, Dr. Shklar thinks that the outraged condemnation of rationalism and all its products with which Rousseau launched his literary career expressed his constant perspective and remained the foundation of his later writings. She insists that Rousseau can be understood only as a critic of society, informing men of their disease, and not as a constructive social thinker, suggesting remedies. He expressed, as she nicely puts it, "the individualism of the weak," as Locke had expressed that of the strong. He hated human suffering, which he portrayed in many passages with unexampled power, but finding its cause not in ignorance, which might be dispelled as Locke and the utilitarians hoped, but in weakness of will, he concluded that there is no remedy. His apparent remedies—*Emile*, *La Nouvelle Héloïse*, *The Social Contract*—all not only contain the seeds of their own destruction,

but do not provide, separately or together, an adequate world for the human soul. Man cannot live without society, society is impossible without inequality, and inequality is another name for human suffering. Rousseau is not only pessimistic, as has often been recognized; the very "perfectibility" of man, his distinguishing characteristic, is the source of his woes. This Rousseau is surely a prophet without hope.

Mrs. Shklar seems aware that her thesis is extraordinary, reducing a man who has been considered a great and important social philosopher, despite his unsystematic mind, to little more than an anguished cry of frustration, anger, and impotence. She deliberately ignores the historical influence of Rousseau's thought, and for the most part other scholarly interpretations, apparently considering that Rousseau cannot be held responsible for what others have made of his work. She would let Rousseau speak for himself. One cannot deny that she has been largely successful in permitting one Rousseau to emerge, the Rousseau who speaks to the modern, agonized, existentialist temperament, and this reader is grateful, since he now understands an appeal he had previously found inexplicable. Still, there are other voices of Rousseau: the protohistoricist of the *Discourse on the Origin of Inequality*, the careful legal phrases and political demands of the *Social Contract*, the practical and evolutionary conservatism of his later writings, which impressed a Vaughn, a Cassirer, a Derathé, leading them to discern a quite fundamental development in Rousseau's thought and learning during the decade following his first discourse, and these are not given adequate consideration. For example, Mrs. Shklar's treatment of sovereignty and the general will seems to void them of all substance; they become inspired, critical metaphors, to be understood almost in reverse of what they seem to say. It is hardly certain that Rousseau considered them so. Nevertheless, Dr. Shklar has given us a distinguished book, ensuring that the debate over the meaning of Rousseau will continue, and contributing greatly to it.

WILLIAM H. HARBOLD

Whitman College

Soviet Perspectives on International Relations, 1956-1967. By WILLIAM ZIMMERMAN. (Princeton: Princeton University Press, 1969. Pp. 336. \$9.50.)

The past several years have witnessed a spate of articles clamoring for more political science—greater methodological consciousness and rigor—in the study of Communist systems. Responses to these appeals, even when the injunction is taken seriously, have been disappointing. The

work under review is a happy exception to this generalization. Zimmerman displays a broad familiarity with contemporary IR literature and, better still, an ability to apply relevant concepts in a sensible manner.

As the title suggests, the book treats recent developments in the intellectual climate of Soviet foreign policy decision-making. By examining the growing Soviet literature on the theory and practice of international relations the author finds considerable evidence of movement towards a more empirical appraisal of the international system. Indeed, he notes a significant convergence with western concepts and perceptions. According to Zimmerman, the new appreciation of the complexities of international reality has entailed a progressive discarding of heretofore sacrosanct Marxist-Leninist principles with their simplistic zero-sum-game assumptions.

The book is organized topically, rather than chronologically. This strategy involves a certain cost in repetition and discontinuity, but the cost is generally balanced by analytical benefits. In Chapter Two, which provides a general integrative background, Zimmerman presents an extensive account of the development of IR as an autonomous discipline in the USSR. Particularly important was the re-emergence of the Institute of World Economy and International Relations in the wake of criticism of Soviet scholarship by Khrushchev and Mikoyan at the Twentieth Party Congress. Much of the impetus proceeded from the new line on peaceful economic competition, which presumably required a more profound understanding of the nature of contemporary capitalism. Not surprisingly, economists and economic questions dominated the early scholarly output of the Institute. As representatives of other disciplines became involved, the range of interests accordingly expanded, as did the level of analytical sophistication.

This developmental process was not unilinear. The dead hand of traditional views and the unwillingness of conservative forces to envision IR studies as anything more than an aid to propagandists posed serious obstacles to growth during the 1956-1962 "foundation period." During the last two years of Khrushchev's rule there occurred a notable breakthrough. The author extends this period of "new respectability" up to the time of writing—1967. However, there is good reason to designate the post-Khrushchev period as a separate stage, in my opinion, even on Zimmerman's own evidence, exclusive, that is, of the Czechoslovak crisis.

Among the reasons for the new receptivity the author mentions Soviet impressions of the salutary influence of political and strategic scholar-

ship on American foreign policy! After the Cuban missile debacle the grass may well have looked greener on the other side of the fence.

The chapter on Soviet perceptions of the international "actors" is particularly well handled. Zimmerman traces the complex process whereby Khrushchev and the specialists came to view the nation-state as the primary actor. To be overcome were ideological proclivities for viewing IR in class-conspiratorial and cosmic world-historical terms. He notes important semantic changes in Soviet terminology as the centrifugal effects of nationalism created problems for both major power blocs in a period of détente.

In a chapter on perceptions of U.S. foreign policy the author cogently describes the overcoming of "contradictions" between the hoary conception of governments as mere executive committees of the capitalist ruling classes and the obvious importance of governments as relatively autonomous determiners of national policy. Indeed, he notes, towards the end of the Khrushchev era, a tendency to go beyond "power elite" or "military-industrial complex" explanations, which have so preoccupied Western critics. Zimmerman argues that during his final years Khrushchev found it expedient for his own purposes to "prettify American imperialism"—a tendency rejected by his successors. To Zimmerman this reversal offers greater promise for a stable U.S.-Soviet relationship than did Khrushchev's lily-gilding approach.

The book is not without faults. The style, although generally lively and interesting, is sometimes strained as the author reaches for the *bon mot*. It is one thing to "bracket" Mao between the K(h)a(n) boys—Genghis and Herman (p. 95); but it seems a bit inappropriate (even if hilarious) to refer to Khrushchev as "the Everett Dirksen of the world communist movement" (p. 225).

Some of the substantive problems are more serious. It may not be quite fair to mention the Czechoslovak crisis, but Zimmerman's analysis of trends, despite occasional caveats, is much too unilinear and leaves little room for such lapses into past "irrationalities." The predictive potential of the analysis is restricted to the most general level.

A more fundamental weakness is the failure to deal seriously and systematically with internal political factors. The excesses of Kremlinology notwithstanding, one cannot comprehensively treat Soviet foreign policy-making without serious consideration of leadership conflict. Zimmerman does not give sufficient attention to this crucial problem or to the related question of personal leadership style.

Finally, the basic issue of the erosion of ideol-

ogy as a major determinant of Soviet foreign policy is not handled as subtly as the general quality of the book would lead one to expect. What Zimmerman appears to see "eroding" is the petrified formulations and *pronunciamentos* of the Stalin era. It is certainly true that many of the hallowed doctrines of the past, including even some of Lenin's basic perspectives, have become inoperative in this "post-imperialist" age. Nevertheless, ideology has always been most important as a methodology, a way of ordering data. Its doctrines and even its categories have often been modified and "enriched." Lenin's *Imperialism* was nothing if not a major revision of Marxism. If the Soviet handling of the Czechoslovak crisis was "non-ideological," then so was Lenin's handling of the Brest-Litovsk negotiations and Stalin's of the 1939 pact with Hitler. But a counter-explanation in ideological terms can also be made in each case and ought at least to be considered. What Zimmerman has done brilliantly is to trace the erosion of old doctrines and analytical categories and the emergence of new ones. This is not the same thing as demonstrating the inevitable end of ideology. What he has done is no mean achievement, however, and his book is an important contribution to scholarship on Soviet foreign policy.

ROBERT F. MILLER

University of Illinois

Custom and Politics in Urban Africa: A Study of Hausa Migrants in Yoruba Towns. By ABNER COHEN. (Berkeley: University of California Press, 1969. Pp. 252. \$5.50.)

Black political scientists and members of the Caucus for a New Political Science will find Professor Cohen's book loaded with implications for their work. Africanists and political scientists generally will find the book a stimulating tonic.

Drawing on his fifteen months of field work in 1962-1963, supplemented by colonial records and earlier studies of Nigeria, Cohen describes and analyzes the social structure and behavior of the Hausa minority in the Yoruba city of Ibadan during the period 1906-1963. This tiny minority of less than one percent of the city's population adroitly exploited their own strengths, the anxieties of the Yoruba chiefs, and the British system of Indirect Rule to achieve 1) their own semi-autonomous residential and business quarter (Sabo) under the authority of a Hausa Chief of the Quarter, 2) a monopoly over the trade in cattle brought to Ibadan from the North, 3) a monopoly over the trade in kola nuts shipped to the North, and 4) for a while a monopoly over the butcher trade

in Ibadan. Cohen maintains that the technical requirements of long-distance trade in perishable commodities are best met, in a pre-industrial society, under the conditions of ethnic monopoly, and the book's primary focus is on the relationship between Hausa ethnicity and their political and economic fortunes.

Cohen's treatment of this relationship utilizes two key analytic concepts. The first, "retribalization," makes the book revisionary of earlier studies which associated African urbanism with "detrribalization." Migrant Hausa have not been integrated in the course of time into the general life of the city. Nor have they merely replicated in Sabo the Hausa culture of their homelands in the North. Instead they have developed a locally distinct ethnicity, participation in which (i.e., "citizenship" in Sabo) is not acquired as a simple function of Hausa identity brought from the North but is achieved by a migrant's taking up roles that make him progressively more settled in Sabo. As he becomes more settled, he takes on a new, and exclusive, ethnicity; he becomes "retribalized."

Secondly, Cohen treats ethnicity as "essentially a political and not a cultural phenomenon." Throughout the history of Sabo, ethnic exclusivity has been a mechanism for fostering and protecting Hausa interests in trade and property. Even the mystic Tijaniyya order of Islam that became dominant in Sabo in the 1950's, leading to the "ritualization of authority" as malams became integrated into the decision-making process and to the intensification and increased pervasiveness of religious ritual, can be seen as a response to the threatened subversion of Sabo's autonomy by the collapse of Indirect Rule and the rise of nationalist parties. Thus, Cohen demonstrates that, contrary to certain notions, "tribalism" is not necessarily conservative and traditional but may be a dynamic and rational mechanism for solving problems. Moreover, "tribalism" is not the explanatory factor it might seem for analyzing African politics, for ethnic identity and exclusiveness are often more a function of vested economic interests than of particularly strong tribal sentiments. Cohen's work here supports that of Richard Sklar, among others, who has suggested that attention to class rather than tribal factors may advance the cogeny of African studies.

From the methodological point of view, Cohen's use of the "Micro-historical" procedure will be especially interesting to students of political development. Implying neither the history of small units nor the kind of brief narrative background we are accustomed to finding at the beginning of community power studies, Micro-his-

tory is an attempt to isolate and analyze the varying interrelationship of several factors through a series of historically related case studies set in a common and limited field and focusing at each point in time on a different sociological or political problem.

The Black Caucus at last year's meeting of the African Studies Association called for increased scholarly attention to the relationship between African and Afro-American phenomena. Here is one splendid point of departure. Cohen's concluding chapter contains a lengthy discussion of his findings within a comparative framework. In suggesting directions for future research and theoretical development, he recognizes that the study of political ethnicity and specifically "retribalization" should not be restricted to pre-industrial societies, and he even refers briefly to possible links between his work and that of C. Eric Lincoln, Essien-Udom, and Glazer and Moynihan. The parallels between the behavioral dynamics of Sabo Hausa and Afro-Americans are many and Black scholar-activists may find Cohen's discussion of "Cultural Strategies in Politics" very suggestive for political as well as scholarly matters. Whites, on the other hand, and especially those of us who are prone to treat Black Nationalism as a "fantasy" or a dangerous departure from liberal pluralism *cum* integration, may well wish to reevaluate the phenomenon and our reaction to it in light of Cohen's concept of the utility of ethnicity.

Just as Lipset demonstrated the possibilities for reinterpreting early American history in light of developmental theory based on research in the Third World, so now Cohen offers a promising basis for the reinterpretation of contemporary American life. The new nations, indeed, have much to teach us.

EVERT MAKINEN

Colby College

The Ideology of Fascism: The Rationale of Totalitarianism. BY A. JAMES GREGOR. (New York: The Free Press, 1969. Pp. 493. \$11.95.)
The Nature of Fascism. EDITED BY S. J. WOOLF. (New York: Random House, 1969. Pp. 261. \$7.95.)

After several attempts to penetrate the dense and convoluted prose of Professor Gregor, I am reluctantly led to the conclusion that he has produced a bad book. Gregor's volume exhibits thorough scholarship; it industriously "covers" a great deal of ground. Some of the analyses of individual thinkers (Gentile, Spirito, the early Mussolini) contain much that is of merit. Unfortunately, however, Gregor's principal theses, judgements and implicit evaluations are so

sweeping and questionable as seriously to detract from the value of the book considered as a whole.

Gregor sets out to provide an "accurate and objective account of Fascist commitment." This would be all to the good, except that he dispenses with the entire thorny question of what constitutes objectivity in the social sciences in a few apodictic pronouncements. The familiar distinctions between objective and "empirical" political "science" on the one hand, and subjective and "normative" political "theory" or "philosophy" on the other, are dutifully trotted out, but they are introduced without any attempt to deal with the severe critiques to which these very distinctions have been and are being subjected in our discipline. Had Gregor seriously considered these critiques, perhaps he would have avoided the perils of what I have elsewhere termed "pseudo-objective descriptivism." Instead, in the pursuit of a misconceived "objectivity," he is led to take literally some patently ridiculous and self-serving statements made by fascist propagandists and to offer up a portrait of Italian fascism which is unrecognizable because of the deep scars which have been omitted. Thus, in Gregor's interpretation, Italian fascism turns out to be committed to the "humanism of labor" and the "presumptive equality of all men" as members of the "Kantian kingdom of ends." According to this interpretation it is not valid to distinguish, as benighted "Anglo-American analysts" have been wont to do, between "fascism, Marxism, and democracy on the basis of fascism's putative 'anti-humanism' and 'anti-egalitarianism.'"

Gregor is intent in this volume not only upon demonstrating the objectivity of his political science but also its *relevance*. The relevance of authentic political science is held to consist in its explanatory and predictive capacity. By understanding the nature of Italian fascism and the conditions to which it responded, we are supposedly enabled to understand the nature of contemporary regimes in the "underdeveloped" and "developing" world. Gregor tells us that an "objective" analysis leads us to regard fascism as "a developmental dictatorship appropriate [*appropriate!*] to partially developed or underdeveloped . . . national communities in a period of intense international competition for place and status." (p. xiii) "One of the central theses of this book," the author informs us, is that Italian fascism "was the first, and remains perhaps the only, fully matured rationale for the totalitarian systems of the twentieth century." (p. 7) Thus, the ideological arguments of Italian fascism are seen to be "paradigmatic" for a host

of recent and contemporary regimes, ranging from Lenin's Russia and Mao's China [!] to numerous smaller societies of the Third World. In the strange alchemy of Gregor's political science, "African Socialism," for example, is held to possess "all the species traits of paradigmatic fascism." (pp. 364, 370)

Had Gregor stuck to his last and confined himself to an analysis of Italian fascist ideology, a subject on which he is most certainly knowledgeable and upon which he has intelligent things to say, it would have been possible for this reviewer to restrict his comments largely to difference of interpretation of the available evidence. I could then have focused on such matters as the relationship of Mussolini and Marxism, the relative weighting of Gentile's importance in the shaping of fascist ideology, whether Gregor has not neglected the "universalist" side of Italian fascist ideology via the Roman myth, whether in his overall characterization of fascist ideology, he should not have taken into account the positions of party militants such as Farinacci and Starace, whether the "corporativism" of Spirito and Bottai is worthy of the extensive attention he gives it, and whether his treatment of Italian fascist "racism" is not altogether too generous.

As it is, however, what is one to make of such a hopelessly amorphous concept of fascism as is that employed by Gregor in this volume? How can one even take seriously the "wave of the future" speculation which characterizes the author's attempt to be "relevant" and to fulfill his stated mission as a "predictive" social scientist? (See, for example, the sweeping generalization about present "totalitarian" trends in world politics on pp. 3, 329, and 381-382.) Essentially Gregor has done little more than abstract elements of fascist thought (nationalism, elitism, voluntarism, racialism, anti-parliamentarianism, ethnocentrism, etc.) and mechanically to discover some of the same elements in the pronouncements of Marx, Mao Tse-tung, Nkrumah and Leopold Senghor. The latter then, in effect turn into fascists. A similar game has been played for some time in the history of political thought, so that, for example, we have had Plato, Hegel, and Nietzsche reinterpreted as fascists (although few indeed have ventured to muddy the waters even further by suggesting that Marx and Mao were). This approach simply will not work, either for thinkers or for regimes. The detailed and specific features of each teaching and/or regime will have to be considered in the appropriate historical and cultural context. This is what real "empiricism" in political and social studies is about.

I find the style of this book to be lamentably lacking in grace, wit, or pungency and cannot but express the hope that in his next book Professor Gregor will devote more care to the art of writing and in particular will stifle his penchant for infelicitous neologisms and endless, convoluted sentences. We have too much of this kind of writing around in the social sciences as it is.

The volume edited by Woolf contains the proceedings of a symposium on fascism sponsored by the Reading University Graduate School of Contemporary European Studies in the spring of 1967. The papers—ten in number—are grouped under four headings, dealing with the political, economic, social, and intellectual aspects of fascism. Overall, the conference appears to have been a useful one, having brought together historians, political scientists, sociologists, and economists in an attempt to offer fresh interdisciplinary perspectives.

Woolf, in his Introduction, stresses the "contemporary relevance of fascism." However, this relevance stems primarily from the fact that fascism constitutes a "negative heritage" for those countries which had the "misfortune to experience a fascist regime," and secondarily from the insights it offers into such contemporary phenomena as "the processes of political modernization, the relationships between political and economic power," the problem of economic planning, and the "appeal of the irrational" to alienated intellectuals in the West. This is to pose the question of relevance far more adequately than did Gregor, for it is one thing to say that numerous contemporary movements and regimes have taken and will increasingly take on the features of "paradigmatic"—i.e., Italian—fascism, and another to conclude as Woolf does that an understanding of fascism may provide "insight" into some problems of contemporary societies, especially those searching for national identity and rapid economic development.

One could object, to be sure, to the failure of the participants more systematically and coherently to address themselves to the question of what constitutes the "essence" of fascism. However, this objection would not be entirely fair because it is quite possible that in the strict sense fascism as such has no essence but must principally be studied in the context of specific movements and regimes. One can perhaps more accurately speak of "fascisms," some of which are much closer to the totalitarian end of the spectrum than others.

Norman Kogan's opening paper is helpful in at least setting us on the way to considering the problem of "defining" fascism. For Kogan, the key characteristics of fascism are that it (1) de-

pends on a "mass base" which supports a charismatic leader, (2) is a modernizing and revolutionary rather than a traditionalist and conservative movement, (3) rejects the egalitarian ethos and extols hierarchy and discipline, typically enforced by the single party, (4) systematically embarks on a program to create a psychologically conditioned "new man," (5) glorifies terror and violence on principle, and (6) embraces a distinctive kind of nationalism which we may call "integral nationalism." These traits, however, must *all* be present and interrelated if a political system is to be categorized as fascist. It is refreshing, after emerging from Gregor's pages, to find Kogan asserting what one had rather suspected all along, *viz.*, that "fascism and Marxism contrast in a number of respects," including in particular the fact that the latter entertains humanist aspirations while the former does not. (p. 18) All the same, it is surprising to see Kogan, after drawing many of his examples of fascist thought and practice from the Italian regime, conclude that in actual practice "Italy under fascism was not a fascist state"! (p. 16) This reviewer prefers to think that Kogan has not said quite what he intended here. If he had said that "Italy under fascism was not a *fully* fascist state," this would have been more consistent with his effort to articulate a model which, while not precisely faithful to any given fascist regime, could help to illumine the nature of all of them. As it is, if we take him literally, we must conclude that there were no fascist regimes (Nazi Germany being excluded on the grounds of its uniquely monstrous biological racism). In that event, what are we studying?

Space limitations do not permit detailed comments on the other essays, which are by A. F. K. Organski, J. Solé-Ture, Gino Germani, S. L. Andreski, S. J. Woolf, S. Lombardini, T. W. Mason, George L. Mosse, and P. Vita-Finzi. Students of fascism will find something of interest in all of them. Organski and Germani have contributed provocative essays on the *conditions* which facilitate the emergence of a fascist system. Woolf has contributed a substantial paper dealing with the question "Did a Fascist Economic System Exist?" (His answer is in the affirmative with reference to Italy, Germany, and Japan.) Mason's paper on "Economics in National Socialist Germany" and Mosse's essay on "Fascism and the Intellectuals" also deserve careful consideration.

Despite its accomplishments, the symposium does more to indicate problems than to provide "definitive" resolutions. In any event, it may well be too early for the latter. If there is a common mood to these studies (except for the paper by Kogan) it may be described as revisionist. The authors are particularly eager to

move beyond "polemics" regarding fascist regimes. But one wonders whether at least some of the earlier studies of fascism—while needing to be supplemented and revised in the light of new material and further opportunity for reflection—did not come closer to portraying the raw and oppressive features of what were, after all, unjust and intolerable regimes than do some of these more clinical recent studies. For if a critical study of politics cannot unequivocally reject fascism, what can it reject?

DANTE GERMINO

Debtors in Court: The Consumption of Government Services. By HERBERT JACOB. Rand McNally, 1969. Pp. 260. \$6.00.)

The fact that most voters participate only minimally in government decision making has been well documented by political scientists during the past decade. However, the citizen's participation in politics through the consumption of government outputs has not been extensively explored. In this short, but suggestive book, Herbert Jacob addresses himself to the political behavior of people as they use government services, receive government grants and are objects of government regulation. Consumption has important influences upon the level of support for the regime, the distribution of symbolic values, and new demands upon the system. By extending his definition of politics to this linkage between government and the citizen as consumer, the author studied the use of bankruptcy and garnishment services in four Wisconsin cities.

Debtors in Wisconsin may have their wages garnished or avail themselves of bankruptcy or Chapter 13 proceedings. The latter, described as "bankruptcy on the installment plan," allows debtors to pay off their debts over an extended time period through payments made to an officer of the court. Each of these services has developed over time in response to political pressures from various sectors of the community. Garnishment laws resulted from creditor demands, while bankruptcy has been a response by government to the debtor. Wisconsin's political history may be partially understood by the differential treatment accorded these groups as they have attempted to structure the law towards their own needs. Of current interest is the fact that as the extension of credit has become widespread, the consumption of these debt-related judicial services has risen among all levels of society. This, in turn, has had an impact upon norms regarding credit and the use of government services to collect delinquent debts.

Various groups in the cities studied made use of garnishment and bankruptcy services. One

might expect wage garnishment to be a tool used against the poor, while bankruptcy to be a service extended to the more affluent. Jacob found that socio-economic variables such as income, race, education, and location, explained only a small portion of the decisions to go into bankruptcy. As the author notes, the effect of these correlates are not linear, but interact with one another with a variety of complex results. Especially important to the debtor is access to an attorney and a communications network of people who have had experience with bankruptcy. An attorney will probably steer his client towards bankruptcy or Chapter 13 proceedings rather than risk the imposition of garnishment. An equally important factor is the debt level and resources of the delinquent. Those with a high debt and low income are most likely to go into bankruptcy.

Creditors seeking to recover assets through wage garnishment also vary. The law is written so that creditors using this service must be well organized and willing to divert manpower towards this goal. In addition, Jacob found that many companies are unwilling to alienate customers through the use of formal proceedings and use other means to recover debts owed them. Thus businessmen resort to wage garnishment only after other alternatives have failed.

The impact of political culture on the rates of debt litigation is an especially intriguing aspect of this study. Using Alford and Scoble's typology which rates the cities on a four point scale from traditional conservatism to modern liberalism, Jacob found marked differences existing in the propensity of citizens to use bankruptcy and garnishment services. These differences parallel other aspects of political participation so that the modern liberalism of Madison supports the consumption of a high level of court services. The linkage between the political culture and the actors within the judicial bureaucracy needs to be further explored. The author notes, for instance, that the judicial personnel and procedures in some cities were more receptive to the use of their services than in others. What political influences bear upon the extension of these services to the citizen?

Professor Jacob has broken fresh ground. His conception of the politics of consumption has implications far beyond this study of the judicial process. Every day citizens use a multitude of public services which, as the author suggests, have a wide variety of political consequences. The political impact of usage patterns warrants additional study. This book will be an important guide to that work.

BOOK NOTES

POLITICAL THEORY, HISTORY OF POLITICAL THOUGHT
AND METHODOLOGY

Social Change and History: Aspects of the Western Theory of Development. By ROBERT A. NISBET. (New York: Oxford University Press, 1969. Pp. 335. \$6.75.)

The thesis of this book is that change in society is mostly in the eye of the beholder. The argument for the thesis commences with the ancient Greeks and their overworked word *physis*. Among other things it means essence, nature, and growth. The argument ends with an assessment of the inutility of 20th-century theories of development and such assertions as these: "change is, however, *not* natural, *not* normal, much less ubiquitous and constant. Fixity is." (p. 270); "continuity of change lies in our constructions; not in history" (p. 294).

Nisbet does not deny change as a phenomenon but objects to assertions that one stage of development does not simply follow but is also the consequence of its predecessor. He asserts that there is no genetic change. Like David Hume, he finds cause to be the result of man's desire to say post hoc, ergo propter hoc. From the Greeks with their cyclical view of growth through the ever-repeated steps of birth, growth, and decay down to Oswald Spengler and Walt Whitman Rostow—all such theorists are only Platonic realists who fail to tell it as it really was.

It is a bit odd that a writer could make such assertions about change and fixity in a century that continues to observe and participate in such widespread change and seems to experience so little fixity. One is reminded of myopic Mr. Magoo crossing a busy street with cantankerous unconcern and reaching the other side unaware of the cars that have honked and crashed into each other to avoid hitting him. And so one is tempted to say it's obvious that civilizations, including polities, are born, grow, and die and the only question is how. To both the Magoo and the growth analogies, Nisbet would reply that the trouble with social theorists is precisely that tendency to analogize and to compare the physical body to the body politic. And there the reviewer did it again.

The author is quite right about this tendency to analogize. In an early (perhaps the first) edition of *Leviathan*, Thomas Hobbes' publisher pictured a giant man composed of hundreds of homunculi. Thomas Jefferson called cities festering sores on the body politic. And Abraham Lincoln intoned that our forefathers brought forth a new nation in liberty. Nisbet with careful scholarship tells how Platonists and anti-Platonists

have analogized, in both the style and substance of their theorizing about cyclical and evolutionary change. As he says, "the power to conceptualize is also the power to hypostasize, to reify."

Indeed it is, and Nisbet does it himself. In criticizing Marion Levy's study of family change in China, Nisbet asserts that "the Chinese family was indeed freighted with stresses and strains. . . ." And functionalism, a rather ill-defined concept, an approach, becomes for the author "the most significant body of theory in the social sciences . . . [seeking] a unified theory of order *and* change." And he reifies history, so vividly that one looks for the man with hourglass and scythe. And he is evidently persuaded by an argument against cause in history that is based on the analogy of a baseball pennant race.

In short, the trouble with the book is that it throws out its own baby and every baby with the bath. Processes in civilization and society and in nature have been conceptualized by various writers both badly and well, but rarely without analogy and metaphor. It is hard to imagine how in social science we can do without such sometimes sharp symbolic instruments if what we are left with are such undefined, unedged reifications as functionalism and history.

The conceptualizations in natural science have been very metaphorical. The human ear contains these parts, among others: concha (meaning shell), the drum, the malleus (hammer), the stapes (stirrup), and semi-circular canals. The brain has its cortex (bark) or pallium (mantle) at one end and the spinal cord at the other, with such important parts as the hypothalamus (underchamber) and hippocampus (seamaster) in between. And the principle of parity in physics has to do with whether particles are arranged in a mirrored or a left- and right-handed relationship to each other. No scientist has been troubled by the fact that molecules really don't have a pair of hands. Two scientists get a Nobel prize for discovering in genetics what they called the double helix, the pair of springs coiled oppositely around each other. It is hard to imagine natural scientists theorizing and experimenting without the use of analogy and metaphor.

The tools of functionalism and history suggest the source of the author's problem, which is, as I see it, the inability to realize his own necessity to conceptualize and to abstract. If we must, as he mostly argues, stick to the concrete, the palpable,

we would of course have no use for such dull tools as even functionalism. We might be better off without such amorphous terms, but if we must indeed abandon conceptualization that is sometimes metaphoric, then we must abandon thought and generalization.

It is all reminiscent of the lack of introspection which Hume evinced when he said that man invented the concept cause because man tended to associate things that occurred one after the other. Hume did not understand that he himself could not explain cause without himself establishing what he thought was *the* cause for cause. Similarly, Nisbet, in conceptualizing, himself seems to reify.

The solution for the problem is to find analogies and terms, however metaphorical, that do help explain satisfactorily the phenomena of change. The author comes close to saying this when he says we can look for "the assertedly timeless, continuous, and uniform sources of change"—with the help of functionalism. Just what these sources (causes?) of change might be, we do not here learn. The author cites Comte for his assertion that change results from the human desires for knowledge, status, and power. He cites Teggart for the idea that change in any larger sphere (from cosmos to society to family) affects the individual. But he does not relate the Comtean assertion, which implies that sources (causes?) of change emerge from within the individual, who is therefore an originator of change, to the Teggart notion that the individual is only an object of change. There is no indication, in short, that the author has any awareness of any contemporary social or natural science other than sociology. Until sociologists and other social scientists become as familiar with psychology and neurology as biologists are with chemistry and physics, Nisbet will be right. We won't understand either stasis or change or development. But not because we use metaphors to describe reality. That has gone on since the first word was spoken. We won't understand because we have reified and refuse to change our own segmental analysis of social phenomena.

What is left open by the author's argument is the confirmation or disconfirmation of his thesis. He might call the gradual acquisition of political power of successive social groups (bourgeoisie, peasants, manual laborers, and black people) over the past four to five hundred years a mere change and not growth toward the realization of man's need for equality. But the author's critique of Platonic realism leaves such modern events unexamined. One is inclined to think historians and functional or systems theorists, replete in the boxes they have built for themselves, are responsible for this very realism which they so appropri-

ately oppose.—JAMES C. DAVIES, *University of Oregon*.

The Foundations of Human Society. By DONALD MCINTOSH. (Chicago: The University of Chicago Press, 1969. Pp. 341. \$10.50.)

Several decades ago the British sociologist Morris Ginsberg wrote a warning to ambitious political theorists: "... what is general in common action is not will, and what is will is not general." Although a generation of political theorists heeded Ginsberg's warning and others like it, with the result that the idealist tradition in political thought went into eclipse, at least one contemporary political theorist is ready to present a novel and serious interpretation of the general will. The tenor of Donald McIntosh's *The Foundations of Human Society* is revealed by his remark that one must choose between the position that the State has a purpose and the standpoint that only subunits in the State have purposes "... before one can begin to grapple with the main problems of political theory in a coherent way." When he failed to make this choice Max Weber "defined himself as a sociologist rather than as a political theorist." McIntosh argues that the State does have a purpose and his book is devoted to exploring the questions of whose purpose it is and how this purpose is translated into action.

The Foundations of Human Society is the first part of a projected three-volume "systematic political theory," that constitutes an attempt to synthesize such diverse tendencies in political thought as the mathematical theory of games, Freudian psychoanalytic theory and the classical tradition as exemplified by Plato, Aristotle and Rousseau. Influences from Marxism, symbolic interactionism, Bentleyan group process analysis and even phenomenological views of zones of human activity are also evident. The result, at least in the first volume, resembles greatly twentieth century idealist thought as expressed by writers like Bosanquet and Hocking. If this string of references confuses the reader, he should not conclude that the book is hopelessly eclectic and contradictory. Instead, he should appreciate the effort that must have gone into relating together this wide range of perspectives. Unfortunately, McIntosh's restatement of the general will is not commensurate to the range of thought that he has brought to bear in creating it.

In the short space allotted to this review it is impossible to do justice to the many lines of argument that McIntosh opens up. *The Foundations of Human Society* repays careful reading for its many suggestive passages, as well as for the subtleties of its major argument. However, at the risk of oversimplification it is necessary to justify the con-

clusion that McIntosh's treatment of the general will is unconvincing. In an involved argument, McIntosh derives the general will from a ground in the process of psychological identification. Identification begins as introjection, or "the incorporation into one's self or something from the outside." Such introjection is a primary process and it includes the idea of "adopting a utility scale of another person as our own." Given this basis one can define the private will of an actor as his utility scale apart from the influence of the utilities of others and the particular will of an actor as his "actual utility scale" when the influence on his preferences of the utilities of others is taken into account. The formation of this particular will describes with McIntosh calls "simple identification."

The general will, however, is formed by two further processes of identification. In primary identification an actor forms an idealized conception of the utility scale of a significant other, takes it over as the utility scale of his superego and partially integrates it with the ego's scale through the process of simple identification. Primary identification is with a parent or parent substitute. Secondary identification involves a transfer of identification from the original object to a new object. Here, the superego image created by the process of primary identification becomes detached from its original object and displaced onto another individual or an institution. This is the ground of political leadership and authority. At the same time a process of "ego identification" goes on between followers in a social group. As a result of these two processes of secondary identification, a general will of a social group is formed. The dynamics of the general will can be described in four propositions. Superego utility scales of group members will normally be closely similar; these utility scales do not necessarily closely resemble the actual will of any actor; these utility scales may be visualized as representations of the actual will of an ideal group member; the utility scale of the ideal group member is the general will of the group. Since members of the group do not have exactly the same interpretation of what constitutes the general will, the real general will is defined as the area of agreement on the ideal group member between all of the members of the group. Thus, the general will must not be understood as a sum or aggregate or average of particular wills, but as a discrete utility scale, "a component of the psyche" of each group member. Freud has solved Rousseau's problem, and we can conclude that a State is an association organized for the purpose of putting the general will of a community into action.

McIntosh's restatement of the general will is unconvincing for several reasons. First, although he does not violate Ginsberg's rule that contents

cannot be regarded as having an independent existence prior to the act of apprehension or comprehension of particular persons (contents are universals, states of mind are temporal processes), he saves the general will from dependence upon a universal mind at the cost of introducing an argument with important gaps. There is a gap between the formation of a superego utility scale and the formation of an image of an idealized group member. Is McIntosh describing anything more profound than reference group behavior? There is a gap between the processes of identification in primary groups and their supposed parallels in secondary groups. Second, since every group has a general will, it is unlikely that the general will of the entire community will be a meaningful and significant variable for political analysis in complex societies. Despite these comments, *The Foundations of Human Society* remains an impressive effort.—MICHAEL A. WEINSTEIN, *Purdue University*.

The Political Thought of Pierre-Joseph Proudhon, By ALAN RITTER. (Princeton: Princeton University Press, 1969. Pp. 222. \$6.75.)

With the possible exception of Rousseau, Pierre-Joseph Proudhon is the most enigmatic of all modern political philosophers. Twisting and turning his way from one level of cognition to the next, his writings are a maze of paradox and irony which the reader enters at his own peril. This undoubtedly explains why Proudhon, obviously one of the most brilliant of all modern intellectuals, is not better known to political theorists in America. Alan Ritter's attempt to interpret Proudhon's political thought through a careful analysis of his writings, therefore, is highly commendable.

Rejecting the often expressed opinion that Proudhon's political thought is so hopelessly contradictory and confused that it cannot possibly be subjected to careful analytic treatment, Ritter prudently avoids existing secondary sources and goes right to the original writings, including some, like the *Notebooks*, which have just been published for the first time. In a further effort to achieve objectivity, Ritter views Proudhon's political ideas without reference to his colorful personality or his involvement in the social and political movements of his day. The author's object here is to be fair, for Proudhon's dazzling verbal exchanges with Marx and other outstanding nineteenth century intellectuals have created ideological backwaters that remain turbulent to this day. Proudhon's tremendous influence upon leading American anarchists, such as William B. Greene and Benjamin R. Tucker, moreover, has given rise to a virtual mountain of additional interpretation, and Ritter was indeed wise in deciding not to undertake the scaling of these forbidding heights.

The thesis Ritter sets out to defend in this book

is that Proudhon, "though a radical, was a realist and a moralist as well." Proudhon's most brilliant contribution to moral theory, according to Ritter, is that he ultimately draws a careful distinction between autonomy and conformity, thereby saving himself from the mistaken romantic notion that self-direction is only possible where all conventional norms are totally rejected as guide lines of social action. Ritter points out that it may well be true, as modern sociology insists, that no individual can altogether escape the pressures exerted upon him by the institutions of society. But this does not mean that the individual is destined to remain in moral limbo forever, the helpless victim of the pulls and tugs exerted upon him from without. To be considered autonomous it is not necessary that the individual reject all volitional directives urged upon him but only those which conflict with his own reasoned idea of what is correct and proper. Proudhon made this clear, Ritter maintains, when he argued that the man who obeys an edict not because it has been commanded by authority but because it equates with his own conception of what is right has not given away any part of his personal freedom at all. "Making dependence on self-validated norms the sign of autonomous choice," Ritter concludes, "reopens the door to liberation which is closed by the sociologists," and thus Proudhon is seen as one of the most reliable of all libertarian writers. Had Ritter stopped here, he would have furnished us with a helpful insight into the complex mind of one of the nineteenth century's most brilliant luminaries.

Unfortunately there are several glaring areas of confusion in Ritter's analysis that detract from its usefulness as a guide to an intelligent understanding of Proudhon's thought. One of these has to do with the excessive weight which Ritter gives to Proudhon's mutualist ideas. Proudhon, it is true, viewed the pressure exerted on the individual by the social group as much less socially harmful than the formal control directed at him by government. But this does not mean, as Ritter suggests, that Proudhon was blind to the enslaving characteristics of the social group. (p. 80) To the contrary, Association, or fraternity, as he sometimes calls it, was in his mind merely another step along the way toward authoritarian control over the individual. Even when proposed by radicals as a revolutionary expedient, Association, according to Proudhon, is essentially dogmatic in character and cannot end up in anything less than the "SYSTEM" which he so much dreaded. As G. D. H. Cole once observed, the only social group in which Proudhon placed much trust was the family. But even here, Proudhon insisted that the individual had to be constantly on guard lest he be

corrupted by the filial pressures he was surrounded by. In view of this it is difficult to understand why Ritter spends so much effort in chiding Proudhon for his failure to see that social pressure does in fact hinder free moral choice by the individual.

Ritter's analysis of Proudhon's political thought is further weakened by the shallowness of his understanding of the basic design of libertarian theory. In the last pages of the book he makes the perplexing assertion that Proudhon was in error when he objected to law on the grounds that it interferes with the growth of libertarian currents within society (p. 21). Ritter defends law as a regulating mechanism on the grounds that not only does it "encourage people to think critically about their norms of choice" but it also "offers valuable support to freedom of decision by guaranteeing the individual a kind of immunity from social pressure that he could not otherwise enjoy." The basic flaw in Ritter's analysis here is that he does not recognize that Proudhon's objection to legal system was not peripheral to his libertarianism but the very heart of it. Under no circumstance, according to Proudhon, can social regulation be imposed upon the individual by the authority of any group, social or political. Had Ritter read *The General Idea of the Revolution of the Nineteenth Century* more carefully, he would have discovered that Proudhon adamantly refused to admit that justice and authority can ever be reconciled. The most destructive of all social crimes takes place, according to Proudhon, when society attempts to sit in judgment of the individual and his actions. Only the individual has the right to judge himself, Proudhon consistently held, for "justice is an act of conscience, essentially voluntary," which owes nothing whatever to authority in any of its forms. Any attempt whatever to coerce or punish the individual for his personal actions is a species of force and hence utterly inadmissible in a libertarian society.

Ritter's inability to understand Proudhon stems from his own commitment to the liberal notion of force and authority as legitimate means of effecting social change. His bias in this regard is revealed when he writes that: "Proudhon's tactical stance, and its dilemma, anticipate those of contemporary libertarian radicals. Like him, they are uncompromising advocates of radical change. Like him, they are unwilling to use coercive means to achieve it." (pp. 193-4) Ritter seems to imply that it is the worst kind of intellectual confusion to believe, as Proudhon does, that society can function efficiently without its law courts, prisons, and other institutional means of compelling the individual to do what he should. Apparently Ritter, like so many other social scientists of the day, is unaware that it is the liberal idea of the state

itself which has brought us to the troubled times we labor to escape. If several centuries of experimentation with systematic force and compulsion have not led us out of the wilderness, is there any point in praying at the feet of that god any longer? Proudhon has much to say on that subject. Unfortunately, the real import of his argument has passed completely over Ritter's head.—WILLIAM O. REICHERT, *Bowling Green State University*.

Simulation and Society: An Exploration of Scientific Gaming. By JOHN R. RASER. (Boston: Allyn and Bacon, 1969. Pp. 180. \$2.95, paper.)

Simulation and Society is not a research report. Rather, it is a handbook of simulation and gaming lore which acquaints the reader with the kind of talk which is often overheard (and occasionally written in the fugitive monographs of) simulation and gaming subcultures of the social sciences. A simulation is viewed by the author as a "complete and accurate representation of a referent," while a game is considered to be "an initial postulation providing the framework for further building." The wide ranging discussion of these two research and teaching strategies is largely descriptive, punctuated with a generous number of excerpts from the writings of simulation and gaming practitioners, a style which is presumably responsive to the author's stated intention of writing a book about models and the men who construct them (although biographical data are quite sparse). The analytic or interpretive portions of the discussion are directed toward the author's additional avowed intention to consider the theoretical and philosophical underpinnings of simulation and gaming, focusing primarily upon the process of discovery, criteria for evaluation, and questions of validity.

Generally the book is well put together. It is engagingly and imaginatively written, relating simulation and gaming as a research and teaching strategy to both images of man and models of man. With respect to the former, the author concerns himself with the implications of viewing man from a variety of perspectives. The discussion of models addresses itself both to the logic of modeling in general and to modeling in simulation and gaming modes more specifically.

The descriptive portions of the book are well executed. Taken as a whole they represent the best account of the breadth of activities associated with simulation and gaming of which I am aware. A comprehensive intellectual history of the social scientific roots of simulation and gaming is sketched and an enthusiastic account (complete with exclamation points!!!) of the successes of computer simulation, man-machine or complex environment games, games for teaching in schools

and games for instructing policy makers is provided.

In addition to its descriptive function, the book is designed to relate simulation and gaming to the metatheoretical or epistemological concerns which are the basis upon which all scientific activity is assessed. The portions of the book addressed to this function are very uneven. On the positive side, the general treatment of modeling as a research strategy is well executed. The author makes clever use of analogy to explain analogizing as a cognitive strategy which promotes scientific discovery. Moving from the process of discovery to the logic of justification, he, with the help of generous quotations from Donald Campbell, presents a competent account of the process of inductive inference from experiments.

The most serious shortcoming of the book is in its treatment of simulation and gaming as strategies for theory building and scientific explanation. The fact that a model (and hence the theory which it models) is an argument or explanation about some aspect of reality is hardly touched upon. When the discussion does turn to the nature of theories, some rather serious confusions are manifest. Theories are equated with theorems (p. 6), laws are contrasted with probability statements (p. 6), and variables are confused with parameters (p. 26). Generally, theories are identified in several different incompatible ways, the most frequent confusion being that of identifying a theory with one of the components (e.g., a law or a prediction) of a theory.

One of the weakest parts of the interpretive portion of the book is the last chapter on the validity of simulation and gaming. Here, the question of validity, which might be legitimately conceived in terms of the logic of justification, is treated more on the basis of biographical reports of how gratifying various experimenters have found their simulation and gaming experience to be. This unwittingly subjectivist position on meta-theory is maintained throughout the discussion which consistently confuses the problems of discovery with those of justification.

In sum, the contribution of *Simulation and Society* will not be one of giving the reader intellectual control over simulation and gaming as theory building strategies. It should, however, help to give both students and professionals in the social sciences a good perspective on what is happening in the laboratories and heads of those involved in these strategies.—MICHAEL J. SHAPIRO, *University of California, Berkeley*.

The Mind of Jeremy Bentham. By D. J. MANNING. (New York: Barnes & Noble, 1968. Pp. 118. \$4.50.)

It hardly seems that almost twenty years have

passed since Michael Oakeshott, in *Political Education*, his celebrated inaugural address at the London School of Economics, exhorted us to regard legitimate political activity as the "pursuit of intimations," to recognize that the main task of "political education" is to train people to understand and participate in their concrete political traditions, and to eschew the "cookery book" approach to politics. Precisely how this conception applied to historical political philosophy—and especially to the leading thinkers of the "tradition"—has never been clear to those of us who were not privileged to attend Oakeshott's classes—and brilliant they were too, judging from the reports! But now D. J. Manning has provided some of the details in his *The Mind of Jeremy Bentham*, which is as much a study in the application of a specific method as it is an analysis of the political doctrines of philosophic radicalism. Indeed, it is more method than substance; as Manning acknowledges, his book "is an attempt to explore certain possibilities and suggestions in Bentham's work, leading, it is hoped, to a new appreciation of his thought" (p. 2). Not, mind you, what Bentham "said" or even "intended" but what can be inferred from his writings! Not what is there but what is suggested! "Suggested to whom and in what terms?" are the central questions, for inferring from the thoughts of others—pursuing their intimations, if you will—is a tricky business, and we must know what standards are being applied before we can begin to understand and evaluate the effort. Manning has been extraordinarily helpful in letting us know that his categories are Michael Oakeshott's.

In that incrementalist, romantic, and almost mystical world of Professor Oakeshott, the hero is the man of talent, insight, and action—the successful cook and statesman who is able to explore and extend the accumulated wisdoms of his art without going beyond them or attempting to condense them to a set of abstract principles that can be used as a "preface to political activity." The Oakeshottian villain, correspondingly, is the "rationalist," the thinker rather than the doer, the man who speculates, deduces political prescriptions from "premediated" ideals, pretends to universality, and shows a disregard for (or ignorance of) the concrete political arrangements of his own society; for it is in those arrangements, according to Oakeshott, that ideals are inevitably imbedded.

This, then, is the intellectual context for a book that is engagingly and concisely written, well organized, carefully and thoroughly researched, and exceedingly clever. To write interestingly and intelligibly about Bentham is no small feat, for "the hermit of Queens Square Place" did all he could to render interpretation difficult if not impossible. Neologisms piled upon archaic phrases, a crabbed

and often witless style, and literally thousands of manuscripts stored in University College, London—the eleven volumes of small print in Bowring's edition of the *Collected Works* are but the top of a monstrous iceberg—are enough to drive off all but the most stalwart of scholars. Dr. Manning has persisted, and we are to be grateful for those morsels he has rescued from the manuscripts. But precisely because the volume of Bentham manuscripts is so great and so relatively unexplored, it is almost impossible to evaluate the author's (substantive) findings. Undoubtedly what Manning has produced is there, and we must, as it were, take his work that it truly represents the still submerged portions of the iceberg. Fortunately, Manning's Bentham, in his essentials, is not strikingly different from the hedonistic curmudgeon with whom we are already familiar; that is, if we discount the excesses of the Oakeshottian sieve through which he is filtered.

The Benthamite system is sufficiently well known to make a summary superfluous. The point of Manning's book is that there is something seriously wrong with the pleasure/pain calculus—not just that it is silly and pretentious, which we already know—with the "greatest happiness" maxim and especially with the political doctrine Bentham extracted from them. With only a slight shift in emphasis that does no great violence to his thought, Bentham becomes the rationalist villain par excellence: he believed unyieldingly in the majesty and power of reason, attempted to formulate a universal system of social and political norms that would have permitted the deduction of rules governing specific conduct from general and abstract principles, and—most importantly—was downright hostile toward both the traditions and political institutions of late eighteenth and early nineteenth century England. Bentham's individualist conception of human nature, Manning says, leads to a "society of stranger," the members of which must be organically reunited into a political community.

There is something fresh and exciting about the suggestion that Bentham faced a world of alienated men and sought to devise a political order that could accommodate them; it is quite the most intriguing argument in the book. Unfortunately, Manning sees this as a defect to be overcome rather than as a means of understanding Bentham more clearly, and the thesis is never developed. (The promise to analyze Bentham as a product of and response to his own times—repeated several times—remains unfulfilled.) Manning sees politics as not simply the technique for regulating competition; it is the art by which the forces that create alienation and conflict can be overcome; politics, in short, is the master skill through which the traditions, identities, and bonds of each unique com-

munity can be discovered and nurtured. Contrary to Bentham's fondest hopes, there can be no universal political ethic, for human life is infinitely complex and filled with singular experiences that transcend rational understanding. Tending to these complexities is, in the Oakeshottian scheme, the job of the politician and statesman, men who are wise in the care and pursuit of intimations. But Bentham, Manning contends, despaired of politicians and their ways; he would have replaced them with rational administrators and substituted for their art and decisions the conflict of interests and the resolution of these conflicts in accord with the sterile principle of utility. Thus, enactment of Bentham's ideals would make it impossible ever to reestablish organic, social bonds among men; each member of the "society of strangers" would continue to pursue his own interests without regard for the good of others, and certainly not caring about the good of the virtually inconceivable whole. In Bentham's "rational society," we are told, "every subject intimidates, and is in turn intimidated by, his fellows" (p. 84). Manning seems to believe that we are now living in a Benthamite world and that an awareness of the shortcomings in Bentham's thought will make our own foibles more apparent, a series of claims I cannot begin to deal with here beyond observing that they rely upon a naive and far-fetched view of historical causation that need not be attributed to Oakeshott.

How one reacts to this reading of Bentham will depend, in the final analysis, upon his attitudes toward both classical utilitarianism and the anti-rationalism of Michael Oakeshott (if it is not improper, at this point, to visit the sins of the student upon the master). There are always dangers in imposing upon a body of doctrine a ready-made scheme of analysis, especially if the scheme is hostile to the doctrine in question and contains an ideology (in the best sense) of its own that is neither clearly articulated nor fully acceptable. In the present case, the dangers are exaggerated, for, as Manning recognizes (p. 15), Bentham's system was neither consistent nor fully coherent. The only way to read Bentham from an Oakeshottian perspective, then, is to *make* him logical and to *force* him into a model he undoubtedly would have rejected. It is noteworthy in this context that Manning does not date or otherwise indicate the chronological sequence of the passages he quotes. This is a most serious failing, for Manning himself acknowledges that Bentham altered and expanded his doctrines from year to year. Thus, it is not Bentham who is presented to us but some "might have been" who never quite was, not—despite the title—the "mind" of Jeremy Bentham that is explored but some higher meaning that is obtained only by ignoring shifts within the several texts and by imposing an alien framework upon the whole. This method of interpretation is ques-

tionable at best. While I am not convinced that it is necessary to go the whole way with those who insist that all works can only be explicated within their own (historical) contexts, I am persuaded of the necessity of at least sticking to the actual texts and not making them (artificially) consistent so that they can be "understood" in terms of the commentator's own categories. Once we sew seed in this garden, we had best be prepared for the appearance of all sorts of hybrid and curiously anachronistic growths that now seem to be vestiges of an outdated way of doing the history of political thought, such as Plato the fascist, Machiavelli the scientist, Locke the democrat, Rousseau the totalitarian, and Bentham the rationalist. In the end, Manning can do no more than castigate Bentham for not conforming to an *a priori* model that was actually designed as a counter-doctrine. It is not just that Bentham was not Oakeshott, for only a moment's reflection suggests that very few political philosophers who were worthwhile have satisfied the rigid demands of intimation pursuit. Politics itself may be largely a matter of pushing beyond the fringes of present institutions ever so slightly, but this is certainly not an accurate description of political philosophy. It simply will not do to contend, as Manning does—and without any attempt to explain or justify his assertions—that the aim of "theory" is essentially to make experience "meaningful" and that political "philosophers" *per se* "do not make any" political prescriptions (pp. 111–112) and then to condemn Bentham for having failed the former and attempted the latter.

Before it retreated into the university sometime within the past century, political philosophy was self-consciously devoted to the justification of political systems and recommendations. And the act of political justification cannot help but commit at least one of the Oakeshottian cardinal sins of "abridging" a tradition, relying steadfastly upon the powers of reason, and calling for the overthrow of the whole of a way of life. The advocate of incrementalism must be either satisfied with the world in which he finds himself or fearful of the prospects of change; he believes that the "good" and "just" society has indeed arrived or is afraid that any but the most cautious of steps toward justice will bring greater misery than the conditions they seek to eliminate. Such a view is characteristic of the contented (and neutral) academician and successful politician; it can never be the vantage of the intellectual partisan or the political malcontent who has been denied power or access to it. So much the worse, then, for political philosophy once it entered the academy and became converted into "value free" analysis, explanation, and political "theory." And what happens when our "just" and "good" society begins to crumble,

or is exposed as a facade that hides manifest injustice, or when we learn that our politicians have been pursuing the wrong intimations all along

The Benthamite conception of interest conflict is undoubtedly an inadequate normative model of politics, but the elitism implicit in the anti-rationalist "pursuit of intimations" is probably even more defective. That Jeremy Bentham may have been among those who delivered us into our present bondage is an interesting suggestion that is undoubtedly open to question; that we are there and must be rescued is now beyond dispute. But Michael Oakeshott—for all his brilliance and insight—is not leading the way to a promised land. —GORDON J. SCHUCHET, *Livingston College, Rutgers University*.

Politik als Interessenkonflikt. BY WOLFGANG HIRSCH-WEBER. (Stuttgart: Friedrich Enke Verlag, 1969, Pp., 288.)

This book is a new and most interesting contribution to the Arthur Fisher Bentley discussion. Written by a German social scientist, the study seizes upon an analysis of *The Process of Government* as an opportunity to provide for a foreign audience a comprehensive, excellently informed and critical account of the "American Science of Politics" since Bentley but without the ironic harping of a Bernard Crick. To view behaviorism, functionalism and group theory as it were from the outside allows for some novel perspectives which by themselves make the book valuable.

That this can be done by a fresh investigation of the concepts, assumptions and methods of Bentley's *Process*, shows not only the (in the strict sense) epochal importance of the 1908-product. The new study also makes quite clear why in certain respects Bentley's book has become, at least for some of its admirers, the "conceptual and theoretical trap" of which La Palombara has spoken (in *Interest Groups in Italian Politics*, p. 13). The rather loose structure of Dr. Hirsch-Weber's treatise is at times slightly confusing. But it helps the author to achieve his various objectives. Time and again he takes off uninhibitedly for interesting excursions covering in depth less well known aspects of Bentley's and of group theory. (He reserves for an appendix, perhaps more useful for a European than for an American audience, sharply focussed critical appraisals of the books by E. P. Herring, P. Odegard, E. E. Schattschneider, F. W. Riggs, and E. Latham.)

Instead of the usual general reference to Bentley's exposure to German social science at the turn of the century, Hirsch-Weber traces very concretely the fascination which such complicated thinkers as Georg Simmel, Gustav Ratzenhofer and the legal philosopher Rudolf von Ihering held for the young Mid-Westerner. However great the intellectual impact of these scholars on Bentley's

concepts, it is probably just as characteristic for them as for the author of the *Process* that his work completely ignores the "governmental process" in continental Europe. Just as his pragmatism is most of the time singularly unpragmatic, Bentley's functionalism is non-comparative to the point of making its assumptions largely useless for the analysis of any but the American system.

Dr. Hirsch-Weber is unable to explain why there is no trace of either Dilthey or Max Weber in any of Bentley's works. He had studied under Dilthey and Weber was rapidly rising to prominence when Bentley wrote. Was this a case of "selective attention?" Especially where Bentley speaks about the importance of "underlying conditions" and activities, he comes very close to Max Weber's insights. But Weber avoided the very pitfalls of Bentley's insistence that there is nothing but a "seamless web" between group politics and the governmental process. Could Bentley's failure to ever mention James Madison and the tenth Federalist Paper be due to a similar self-suggestion or originality?

Dr. Hirsch-Weber's discussion of Bentley's seldom highlighted treatment of the judicial process shows very well the merits and shortcomings of the *Process*: there are here, again partly inspired by Ihering, valuable building blocks for legal realism, but also the errors flowing from his conviction that Supreme Court decisions are "group activity" like everything else.

The most valuable and most original excursus of the book explores the concept of "interest" from the Corpus Juris to Planetz, via Rousseau and, of course, Bentley. Here a linguistic analysis drawing especially on the later Wittgenstein adds important dimensions to the discussion of the *Allgemeininteresse*, of the public interest in both its descriptive and normative content. Whether there might not be a connection between the ontology of the early Wittgenstein (at least as interpreted by the Vienna circle) and Bentley's thinking remains an open question not touched upon by Dr. Hirsch-Weber. But there is much valid criticism of the notion of latent and potential interests. David Truman's use of the term "attitude" evokes for the author certain highly problematic hypotheses of German experimental psychology, especially of the pre-behavioral structuralists.

Quite correctly the book points to and explains the empirical and logical weakness of Bentley's defiance as "mental terms" of all statements suggesting causality or motivation. The author might have been even more critical of Bentley's concept of "transaction," defined by Bentley (and Dewey) as "man-in process-with environment." Even though the term appears only in Bentley's later works, especially in the *Knowing and the Known* (1949), its substance is very much around in the *Process*. Arnold Brecht has contributed a short but

appropriately savage criticism of the entire notion (in *Political Theory*, pp. 512 f.) where he concludes: . . . "concentration on the transactional as distinct from the inter-actional (causal) aspects of events in social life is as yet a vague program rather than an achievement."

Of course on many points Bentley can be defended (and Hirsch-Weber does a good job of it) by pointing to his own often repeated claim that he did not wish to offer more than a "vague program," that he was merely proposing provisional methods for empirical research he himself had not undertaken. Disciple of Charles Peirce he was, he followed the command of his master "not to block the road to inquiry" so faithfully that he shunned all definitions which might have proven premature even though they might also have lent concreteness to his propositions. There is, however, one seemingly extravagant dictum of Bentley's which is often quoted to show that he was not just the pioneer of modern behaviorism but also an uncritical hanker after quantitative data. To be sure he has written (*Process*, p. 201): "The statement that takes us farthest along the road toward quantitative estimates will inevitably be the best statement." But this is preceded by a never quoted (here even Dr. Hirsch-Weber fails Bentley) and in present-day research often ignored caveat that it must first be ascertained whether such a quantitative statement "does not otherwise distort the social facts."

The excellent study concludes with a discussion of Bentley's legacy. This has been done before and most recently in the contributions by David Truman and by Richard W. Taylor to the *International Encyclopedia of the Social Sciences*. Just because the author looks at the *Process* from the outside, it would have been interesting to have him discuss the place of Bentley, the curious social philosopher and muckraker, in the tradition of American political thought. Described by some as a cynical conservative, Bentley was in fact (moderately) active in Mid-Western progressive movements. His assumptions of an eventually un-failing equilibrium emerging from the conflict between "activities" might appear naive. They are, however, in line with Bentley's acceptance of the democratic idealism and basic optimism that was prevalent at the time he wrote the *Process*. It might be worthwhile to investigate further (as Mancur Olsen has done very tentatively in *The Logic of Collective Action*, pp. 130 f.) the affinity between the populist strand of American pluralism and an antistatism of which corporatism is the conservative and mutualism or anarchism are the progressive manifestations.—HENRY W. EHRMANN, *Dartmouth College*.

Introduction to the Reading of Hegel. By ALEXANDRE KOJÈVE. Edited by Alan Bloom, trans-

lated by James Nicholls. (New York: Basic Books, 1969. Pp. 287. \$8.50.)

Studies on Marx and Hegel. By JEAN HYPPOLITE. Edited and translated by John O'Neil. (New York: Basic Books, 1969. Pp. 202. \$6.50.)

Idealism Politics and History: Sources of Hegelian Thought. By GEORGE ARMSTRONG KELLY. (New York: Cambridge University Press, 1969. Pp. 387. \$13.50.)

The first two books are translations of very prominent French-language commentators on Hegel's work. Kojève, a Russian by origin who finished his life as a civil servant of the European community, taught in Paris during the thirties at the *Ecole Pratique des Hautes Etudes*. This book is based on those lectures, but Kojève did not publish it himself; rather the book was put together from Kojève's lectures for a number of different sessions, and published together with an introduction by Kojève shortly after the war by Raymond Queneau. This translation includes about half the material of the original.

This book is a fascinating one in more than one way. Kojève remains a mysterious figure, who published very little, but had an extraordinary influence. In fact it was through these lectures at the *Ecole Pratique* in the 'thirties that Hegel really entered the French philosophical scene. In fact up to the thirties France remained strongly impervious to post-Kantian German thought—strangely, that is, in view of what has happened since. Even Marxism was not a serious force intellectually. Then Hegel suddenly gained intellectual naturalization, in the company of Marx and Heidegger.

Thus the Hegel who is an important reference point of post-war French thinkers of the so-called "existentialist" left, of Sartre and Merleau-Ponty, is first introduced in these lectures which are important documents in the history of thought. Those familiar with the work of the later authors will recognize the link at once. We are looking here at a Hegel who is being read in the light of Marx, but is not seen as a simple "fore-runner," but rather as a way of rediscovering in Marx the full philosophical depth of a dialectical notion of history; rescuing Marx as one might put it from the mechanical interpretation according to which the "base" determines the "superstructure," an interpretation which always has to be balanced later by an admission that the "superstructure" also affects the "base" to some degree. Whether this has been a correct interpretation of Marx is certainly open to question (the reaction to it has come in France with Althusser and his associates); but no one can deny that, aided by the rediscovery of the early Marx manuscripts, it has been an immensely influential one.

One might also question the interpretation of Hegel. The central text for this contemporary re-

interpretation is the *Phenomenology of Spirit*, and this is the work on which Kojève lectured, and which he studied minutely; the most discussed passage is the dialectic of the Master and the Slave, to which Kojève gives a central place. And this is understandable in an approach which is interested in understanding what Hegel had to say about man and human history. On this subject there are few more fascinating works in the history of Western philosophy. But the danger, from which Kojève doesn't fully escape, is an "Anthropologizing" distortion of Hegel's thought. Hegel's Spirit is not simply that of man, even if it is not equivalent to the orthodox idea of God. It was the young Hegelians who centered the dialectic on man; much of Hegel's thought becomes incomprehensible if one does this. It would be impossible to read the *Logic* or the philosophies of nature, or religion, for instance, with the same eyes that Kojève has read the *Phenomenology*.

In a sense we should think of Kojève more as an original philosopher who thought out his ideas through a meditation on the *Phenomenology*. Hyppolite, on the other hand, is a genuine commentator, the dean of Hegel scholars on the French scene. He too is best known for his admirable translation of, and commentary on the *Phenomenology*; but his interpretations are well grounded in the whole of Hegel's work (he has also published a commentary on the *Logic*).

The book of Hyppolite's translated here is a collection of essays which touch on one of the central issues which arises from the contemporary concern with Hegel, his relation to Marx. Precisely because Hyppolite doesn't share the "anthropologized" interpretation of Hegel, but sees that Hegel is talking about an absolute subject who is not simply human but cosmic, he can appreciate the extent of Marx's break with Hegel: it involves in fact a declaration of independence of man and human purpose within the cosmos. For this point of view the monism which Engels re-established supposedly on a materialist basis, and which has become the orthodoxy of official communism, seems to run counter to the spirit of Marx's work. As Hyppolite says of these "East European commentators" in the preface written specially for the English edition, "they preserve in Hegel what Marx felt obliged to reject" (p. viii).

The essays, which are arranged in four sections, range fairly widely. The first and fourth sections contain papers dealing strictly with aspects of Hegel's philosophy. The middle two sections are, however, of particular interest to political theorists. Part II contains an essay on "the significance

of the French Revolution in Hegel's *Phenomenology*" which is well worth reading. Hegel's attitude to the French Revolution is one of the keys to understanding the genesis and purpose of his political thought. One of the crucial passages for understanding this is the short, ten-page section of the *Phenomenology* on "Absolute Freedom and the Terror," in which Hegel tries to draw out the contradiction which he sees in the goals of the Revolution. Hyppolite gives a very useful background and commentary to this passage and the preceding one.

Part II also contains a commentary on Lukacs' *Young Hegel*, while Part III, devoted to Marxism and Philosophy, has papers on Marx's critique of Hegel's concept of the state, and on the structure and philosophical presuppositions of *Capital*.

Professor Kelly's book is an attempt to trace the development of idealist thought in modern politics through its formative period in four connected essays, devoted respectively to Rousseau, Kant, Fichte and Hegel. Idealism is seen here as the doctrine that reality must be understood in relation to mind, spirit and reason, which means ultimately in relation to an underlying ideal form. Hegel stressed how much his idealism was in continuity with that of the followers of Socrates, with the theory of Ideas of Plato and Aristotle, and not with the epistemologically-based views of a Berkeley, for instance. But the crucially new dimension, unknown to the Greeks, was that of 'historicism,' the notion that history could be seen as polarized by the Idea towards higher and higher forms of its realization, culminating in a state founded on reason.

Although Rousseau, and even in some respects Kant, were not idealists in this sense, we cannot understand the background to this extraordinary current of thought which arose in Germany at this time, and which has had such a fateful influence on modern history, without returning to them. We have been familiarized with this filiation by the polemics of some modern authors against "totalitarian democracy."

But Professor Kelly's work most emphatically does not belong to this class of put-downs. "Although an empiricist by conviction" (p. 6), he has attempted to understand the views on politics and history of his authors against the background of their deeper philosophical ideas. In particular, for instance, he attempts to cast light on the differences between the four authors by relating them to their different notions of time. This book is a really valuable and timely contribution to our understanding of this important tradition of thought.

—CHARLES TAYLOR, *McGill University*

AMERICAN GOVERNMENT AND POLITICS

Congressional Committees. By WILLIAM L. MORROW. New York: Charles Scribner's Sons, 1969. Pp. 261. \$6.95.)

In the exploratory work on congressional committees advanced during the past several years, most studies have dealt with a particular committee, or a particular congress, and considered a limited number of explanatory variables. Such specialization is understandable given the importance of "field" research, the value of interviews with congressmen and staff, and the number and complexity of relevant factors even for such limited designs. But students of the field now urge testing of some of these particular findings across a range of committees or a range of congresses—to see the varying impact of subject matter, external environment, changes in membership and in chairmen. Work on comparative committee studies is beginning. The more elaborate designs which will test one set of findings against a range of possible influences still remain a goal for future research. It is an emergent, challenging field—with much of the task of comparative analysis and empirical generalization remaining to be accomplished.

In this field at this time, William Morrow has written *Congressional Committees*. The book offers a macro-view of the place of committees in the American political system (pp. 1, 2). It traces the formal and informal committee structure in relation to such systemic variables as the separation of powers, federalism, patterns of conflict and decentralized decision-making in the national government. Chapter 2 outlines the formal committee structure, discusses the impact of the seniority system and the committee assignment process on that structure and concludes that "the formal organization of committees represents a response to those social forces which have been able to exploit constitutional features and the decentralized character of American politics to their best advantage." (p. 57). Chapter 3 examines the informal structure. It traces the possible role relationships members may adopt with participants in the external environment, such as interest groups, the public, executive department personnel; discusses the role of committee hearings; and points out "how informal organization . . . nourishes and extends formal organization in a mutually reinforcing, cyclical pattern which helps to institutionalize the patterns of conflict in the American system and within Congress" (pp. 143, 144). Chapter 4 examines the relationship between committees and the Executive; discusses the procedures and possibilities for congressional oversight; and concludes that "the same factors which encourage committee

reinforcement of the decentralized character of the American political system . . . also profoundly affect the character of committee-executive relationships" especially as regards the exercise of the oversight function (pp. 220, 221). While the author draws on some interviews conducted as a Congressional Fellow in 1965-66 and some research in committee hearings and other documents, the main basis for generalization is the existing literature on Congress and its committees. The ambitious scope of the enterprise deserves notice, offers a useful overview of the subject, but invokes certain obvious difficulties.

At the present stage of knowledge, some of the generalizations offered cannot be substantiated. For example, Morrow discusses the "group influence" on the assignment process and points out how this influence contributes to intra-committee conflict: "Such a procedure usually guarantees that committees will be structured so as to promote conflict between groups' spokesmen, each seeking to advance the cause of the dominant group or groups in his district" (p. 85). He cites the House Education and Labor Committee as example. But we do not know the extent of group influence on the assignment process, nor its relative influence compared to that of the party leadership or the chairmen of the committees concerned, nor the extent to which that influence may vary from one committee to another. The House leadership keeps an eye on selection for the three prestigious committees of Appropriations, Rules, and Ways and Means—partly to ensure that conflict will not dominate committee decision-making. And from time to time the leadership may influence other appointments. Nor do we know the range or variation in committee conflict. The group conflict that fractionalizes Education and Labor is not found on Armed Services, particularly notable under Chairman Carl Vinson for producing unanimous committee votes on controversial legislation. Some pioneering work by Richard Fenno suggests conditions under which committee cohesiveness may vary. Indeed, according to Fenno's analyses, Education and Labor—cited by Morrow to illustrate his point—may be, rather, the limiting case of extreme committee conflict. Other such statements recur through the work—on the impact of the seniority system, on patterns of substantive committee oversight—which require just that specification of degree of impact and committee variation that is only beginning to be available in the literature.

Morrow admits the difficulty in the preface and urges that the conclusions be taken as "hy-

potheses" rather than "principles." (He continues: "To the author, there is little doubt that the generalizations to appear in the following pages are for the most part valid, but few attempts will be made to explain the extent of their validity.") However, in the vocabulary and phrasing of conclusions, the absence of questions raised for future research, and the lack of admission of areas where no firm information exists, the text does not follow the spirit of the preface on this point.

And yet in providing a macro-view of committee structure and functioning, *Congressional Committees* makes certain definite contributions. Morrow's outlining in Chapter 3 of the possible dimensions and impact of the committee role system and its basis in six spheres of external influence deserves attention and may prove helpful as a base for typologies in future work. His application of committee structure to the problems of oversight in Chapter 4 is particularly thorough and thoughtful. Most importantly, he manages to bring together in one volume an impressive amount of literature on the subject. And throughout the work, the author succeeds in conveying a sense of the complexity of pressures brought to bear on the committee system and the way that system may function as a "vital . . . part of the nerve center of the American political process" (v). These descriptions make useful reading not only for political scientists, but for undergraduate students of Congress as well. There will be other, more analytical books on congressional committees. But this is a first—which, by itself, is no mean achievement.—BARBARA HINCKLEY, *University of Massachusetts*.

The Corporation in American Politics. By EDWIN M. EPSTEIN. (Englewood Cliffs: Prentice-Hall, Inc., 1969. Pp. 365. \$8.50; paper, \$4.95.)

Epstein establishes seven goals for his book: he intends to be descriptive and prescriptive regarding corporate political activity, and he hopes to offer a framework for the analysis of this activity that will reveal its significance for the American social order and corporate system. In addition he offers, for changing legal constraints on this activity and for further research, recommendations which are consistent with his text and argument. Epstein is neither a social theorist nor a political philosopher. He is a scholar who tries to be careful, thorough, and unbiased. His references are extensive, his prose is concise and always clear, he avoids concealed value judgements on small matters. Within his value system he is neither friend nor enemy of corporations. He maintains a distinction between electoral and governmental politics and is never deflected from his chosen focus of corporations. This is not a book about any other kind of pressure group. It is, then, modest,

thoughtful, and easy to read. The book should be manageable in undergraduate courses (although the paperback price is singularly inflationary), for it contributes to the rational discussion of a complex issue. For the modern political scientist the book is less fruitful and for the political activist it can be maddening, for reasons I shall try to state.

Chapters 1 and 2 are introductory. Chapters 3 and 4 contain an historical review of corporate political activity. Epstein traces the growth of corporations, the abuses of the robber barons, and the failure of early regulatory efforts. Detailing the growth of trade associations and corporate public relations, he outlines the changing nature of corporate political involvement in the 20th century. For the Post-World War Two period he subordinates his historical review to a discussion of the reasons for federal expansion and its consequences for the distinction between private and public enterprise. His historical outline is untheoretical however. The development of corporate political activity has been influenced by the changing nature and scale of economic organization, technological innovation, political invention, ideological changes, the need for socializing risk, and the dynamics of the bureaucratization of the activity itself. Epstein leaves the modeling of these factors to the reader. The absence of formal thinking at this stage allows an unsophisticated justification of corporate political activity. He can view it as a response to increasing public-private interdependence without analyzing its extent, loci, or causes in more than a superficial manner.

Chapter 5, detailing the extent of corporate political activity, contains many items that normally escape the attention of political scientists yet could be informed by Drew Pearson's columns or the pages of *Hard Times*. In general, the less savory aspects of corporate involvement are neglected and involvement in administrative processes and regulatory proceedings is treated weakly and naively.

The next three chapters consider arguments for and against corporate political involvement. His analyses are usually crisp and telling. Chapter 8 contains a first-rate, imaginative, 40-page discussion of the political resources of corporations. It is one of the highlights of the book. But it, is followed by a weak, biased and irrelevant discussion of community power structure. He accepts the caricature of the elite theorists offered by Polsby's *Community Power and Political Theory*. Chapter 9 discusses the legitimacy of corporate political involvement in a vacuous manner. The question posed is whether such activity is or is not legitimate, and I do not see that this is an empirically or normatively useful way of posing the question. Chapter 10, the last one, contains a thoughtful discussion of the laws surrounding corporate polit-

ical activity. Epstein never gets around to defending the major premise of his book: that corporate political activity is legitimate because of public-private interdependence and the pluralist nature of American politics.

Epstein's writing is marred by occasional statements and jargon that betray an uncritical acceptance of contemporary consensus politics. The FTC is viewed as a leading defender of the public against corporations; the Vietnam War is "our commitment." Regardless of what one thinks of such a value system, the fact is that this is a political position in a book that needs either to scrupulously avoid one or advance a blatant one. It is the value position of much of the white, "liberal," upper-middle-class, and thus too often a political position that is greeted as the hallmark of objectivity.

Such a matter might be a minor annoyance were it not symptomatic of the major flaw of the book: a permeating, uncritical acceptance of pluralist dogma. Three components of this dogma which Epstein accepts are: (1) insensitivity to what Schattschneider has called "the scope and bias of the pressure system;" (2) evaluation of the political system on the basis of limited attributes of the input side of the policy-making process; and (3) inattention to policy outputs in operation. Like all pluralists, Epstein is also unaware there is something called analysis that enters the policy process as well as bargaining. Any evaluation of corporate political activity must confront Schattschneider's arguments and works complementary to them such as Mancur Olson's theories of interest group mobilization in *The Logic of Collective Action*. Adherence to pluralist dogma allows Epstein to avoid corporate involvement in regulatory proceedings and administrative agencies where serious issues of the capture of public power by private groups are involved. Finally, if one concentrates on policy outputs in operation, one gets a very different view of the consequences of corporate political activity. Pluralist dogma allows Epstein to avoid attention to such matters as the symbiotic relationships between defense contractors and the military services, the role of food corporations in suppressing the production and distribution of fortified foods to the poor at potentially negligible cost, or the industry-dominated Coal Mine Safety Review Board.

Pluralist dogma—on the one hand an ideology in the service of a limited set of social interests and on the other a seriously incomplete model of American politics—is not an adequate model for the study and evaluation of corporate political involvement in the U.S. Because this dogma suffuses Epstein's argument, his book is far less than the sum of its often admirable parts.—MICHAEL J. WHITE, *University of Kentucky*.

Power in the Senate. By RANDALL B. RIPLEY. (New York: St. Martin's Press, 1969. Pp. 246. \$6.50.)

Professor Ripley purports to discuss the distribution of "power" in the Senate from two complementary points of view. In part I the history of the Senate since the Civil War is sketched in terms of three modes of power distribution—centralization (preponderance of power in party leadership), decentralization (committee-centered), and individualism (power dispersed to subcommittees and individuals). Parts II and III then set out "to explore the present Senate in depth," relying mainly on Round Table sessions with senators and aides held at the Brookings Institution in 1965. The intention is to examine the dimensions and consequences of the current phase of "individualism," which Ripley claims had its beginnings in the mid-fifties. Though he eschews any attempt to devise a precise definition or measure of "power," it becomes clear in the course of the book that what he has in mind is the ability to effect or influence policy outcomes. He thus contributes to the growing literature on the erosion of the Senate's so-called "inner club" and the increasing dispersal of lawmaking roles and opportunities within the upper chamber.

Though Ripley acknowledges that power has both "personal" and "institutional" bases, his historical chapters generally focus on the latter; he thus presents a brief organizational history of the Senate together with an assessment of the relative importance of party and committee leadership posts in successive periods. Ripley's criteria of "importance" are not always clear; relying mainly on biographical and historical studies he refers sometimes to a person's or a position's reputation for powerfulness, sometimes to more concrete legislative achievements. His dependence on David J. Rothman's *Politics and Power: The United States Senate, 1869-1901* is particularly heavy, and he is able to reinforce Rothman's observations with some interesting data on the late-nineteenth-century "institutionalization" of the Senate. His treatment of other periods, however, is often less impressive. He does not seem to be aware, for example, of Joel Silbey's demonstration of the strength of party identification in determining congressional voting alignments in the 1840's and even into the fifties; Ripley rather assumes (p. 25) the James Sterling Young's generalizations with respect to the pre-1828 Senate can be applied to the entire pre-war period. Nor does he take adequate account (pp. 15, 31) of the inroads the emerging "conservative coalition" made upon the "centralized" 74th and 75th Congresses. The labeling of various other problematic periods is likewise left unqualified and unexplained.

The most recent historical transition, that of the

post-World War II Senate from "decentralization" to "individualism," poses particular difficulties. Even if one acknowledges that it is possible meaningfully to speak of overall distributions of power-in-general, serious questions as to the mechanisms of transition and the relationships among Ripley's three modes of power distribution remain—difficulties attested to by Ripley's inability to pin a single label on the years 1955-1961. What these years demonstrate in particular is the inaccuracy of conceiving of "individualism" and "centralization" as opposing modes of organization; this period in fact displayed *both* trends, and there is considerable evidence that exercise of certain prerogatives by the majority leadership, rather than diminishing the "power in the hands of individual senators" (p. 106) in many instances did very nearly the opposite. And problems of explanation loom large. While Ripley's main concern is with the gradual erosion of the "institutional" power of southern conservatives, he acknowledges (pp. 66, 76) that subcommittee proliferation and a general dispersal of "personal" power antedated the decisive weakening of "the hold of southern Democrats on the Senate" by several years. Yet neither here nor in the earlier historical sketches is there any sustained attempt at explanation, even in terms of such obvious "external" variables as the character of executive leadership, the context of policy needs and demands, and changes in the nature of electoral politics.

In Parts II and III Ripley turns from historical analysis to a fuller description of the "dispersion of power in the contemporary Senate," dutifully reporting the views of Round Table participants on the character and strength of various party and committee posts. Of particular interest is the generally positive assessment among the senators as to their own potential as legislators and the opportunities afforded by committee structures and resources, though Ripley makes little attempt to analyze the variations and conditions of this sense of efficacy or to test it against performance. Ripley accepts at face value his respondents' portrayal of "segmented, sporadic" processes of legislative initiative and increasingly permissive norms which exclude only "six to ten" senators from some sort of "legislative effectiveness" (pp. 160, 168), but he makes no attempt to discriminate among the various facets of legislative initiative or between different policy areas and committees.

While one can appreciate the service Professor Ripley has performed in pointing to significant general changes in Senate norms and in the distributions of legislative roles and resources since the fifties, the study's usefulness is considerably reduced by this failure to discriminate and differentiate. Various observers have noted that a cer-

tain type of senator has become more conspicuous of late—activistic in his legislative orientation, generally liberal, often low in seniority and representing a large or urban state, oriented toward the media and national issues—and Ripley in fact hints that his sample may be disproportionately composed of such men (p. 236). What we need to know is not simply that senators-in-general are enjoying a new-found "legislative effectiveness;" we need to be much more precise about the types of legislative roles that are emerging, their distribution and their viability. To what extent is this new activism a matter of publicizing and investigating issues? How much actual policy innovation and formulation is going on? Most importantly, is the capacity to *mobilize* the chamber becoming more widely shared as well? Rarely can the answers to such questions be given in broad general terms; nor is the matter of explanation any less complex. The roles a senator assumes, the initiatives he undertakes, and the degree of success he enjoys may well be dependent, for example, on such diverse factors as the character of his constituency and his electoral situation, the nature of his committees' leadership and organization, patterns of agency activity and group access in various areas, and so forth. This is not to say that general trends cannot be discerned. But any overall picture we gain of dispersals of "power" in the Senate will remain undifferentiated and vague, and our efforts to isolate and order the relevant causal factors will be frustrated, until we pay considerably more attention to patterns of empirical detail and to the necessity for analytical precision in approaching them.—DAVID E. PRICE, *Yale University*.

Congress and the New Politics. By JOHN S. SALOMA, III. (Boston: Little, Brown and Company, 1969. Pp. 293).

John Saloma's study of Congress is an ambitious and thoughtful effort. It seeks to establish guidelines for evaluating present-day congressional performance, to suggest ways in which Congress will adapt to the new computer technology and the concomitant "information revolution," and both to outline the basic challenges that Congress will have to confront in the future and to presage the possible adjustments it will make in response to these challenges. The author accomplishes these tasks with varying degrees of success.

Much of the book focuses on the difficulties of evaluating so complex and multi-functional a political institution. Professor Saloma maintains that those who are critical of Congress and wish to reform it are not always sufficiently concerned with the possibility that the prescriptions they offer are a product of their own normative predilections, and that the alterations they advocate will dimin-

ish the institutions capacity to undertake responsibilities which other students of American politics happen to think are important.

He discusses six significant functions which Congress is expected to perform (the representative, legislative, investigative, informative, administration control, and the constituent service functions) within a context of alternative "models" or "conceptual frameworks" (the latter is a more appropriate description of his constructs) of legislative-executive relations, on the one hand, and the distribution of power within Congress on the other. Four perspectives of legislative-executive relations are delineated: the presidential-responsible party perspective, where "the President is assigned the primary leadership role supported by powerful party leadership in Congress;" the presidential pluralist or pluralist perspective, which views government as a "bargaining system with varying veto powers available to the participants;" the constitutional balance perspective, which stresses the constitutional or legal "balance in the roles of the President and Congress;" and the Whig or congressional supremacy perspective, which insists that Congress, not the President, "should be the locus of policy leadership." His four formal models of the legislature's internal organization are defined as "control by the presidential party, control by congressional party, control by congressional majority, and decentralized control with accommodations reached through the bargaining of all participants, the President included."

Saloma concludes that Congress has fulfilled its functions more responsibly and has been more agile in adapting to changing demands than most of its' critics have suggested. His is obliged to note, however, that its' performance in many respects still leaves much to be desired. The chief merit of this portion of the book is that it brings together in a reasonably systematic fashion the varieties of vantage points from which Congress has been assessed and the normative concerns that have influenced thinking about the role of Congress within the American political system. Saloma marshalls his evidence and arguments well. He adds little to the discussion that is new, however. This is true primarily because, as the author himself observes, the conceptions of American government inherent in the frameworks within which congressional performance is gauged are inadequate. They are static and stereotypical, for the most part, and neither contain nor permit particularly rewarding generalization. This weakness is partially an indictment of the literature on Congress, since other specialists have not given Saloma the comprehensive models his analysis requires. On the other hand, if the book does de-

velop *new* guidelines for a more realistic and sophisticated evaluation of congressional performance, the author fails to make them sufficiently explicit.

The final two chapters look ahead to the challenges that are likely to face Congress in the 1970's and beyond, with particular emphasis on how the institution is likely to adapt to the changes that computers hold in store for the aggregation, retrieval, and application of information. Saloma rightly asserts that Congress has been at the mercy of the Executive branch for much of the information that informs its' deliberations. He suggests that independent access to greater amounts of data will provide Congress with far more information than it is now able to compile and that electronic data processing will permit Congress to use this information more efficiently. If congressmen will only seize the opportunity to exploit the new technology, he argues, they will improve their capacities to review legislative measures proposed by the administration, to initiate appropriate measures of their own, and to exercise greater control over the manner in which the bureaucracy administers ongoing programs.

His discussion about the ways in which Congress is likely to apply the new technology is interesting and wide-ranging, but it is also less disciplined than his earlier chapters. Some of the possible consequences of computer use forecast by Saloma are difficult to accept. He suggests, for example, that computers will "introduce a bias entirely consistent with democratic theory—toward the free exchange of information and ideas." Yet, it is not entirely evident why swift, easy access to reams of information by future congressmen will necessarily facilitate the exchange of facts and arguments. Much will continue to depend upon which members of Congress avail themselves of the information, the uses to which the information is put, and the rules of relevance individual members and the Congress as a whole apply to the law-making process. Nor is it entirely clear why new information systems "should also afford democratization of committee power," or why congressmen will not have to rely upon "middlemen" for their information, as members do now.

Saloma's final chapter deals with the legislature's capacity to adapt to future challenges, and is the least rewarding section of the book. He catalogs some significant, but obvious, changes currently taking place in the United States (*e.g.*, "increased nationalization of politics and the decline of southern power, the growth of a sophisticated electorate and corresponding new forms of political organizations, metropolitan growth and the rise of a new urban cleavage"), although some

may take exception to his assertion that there has been and will continue to be a "decline in southern power" in national politics. Unfortunately, his efforts to link these changes with the adjustments the institution is likely to make to them is not terribly convincing. He generates more speculation than he can handle well in a single chapter, and the relationship between Congress and the "New Politics" which is promised in the book title is given short shrift, indeed. The "New Politics" is defined so broadly that the term's usefulness for analysis is severely circumscribed.—IRWIN N. GERTZOG, *Yale University*.

Cooperative Lobbying—The Power of Pressure.

By DONALD R. HALL. (Tucson: The University of Arizona Press, 1969. Pp. 347, \$8.50.)

Donald Hall's *Cooperative Lobbying* must have been a terribly frustrating book to research and write. Hall set out to examine in depth the lobbying activities of "peak" associations—organized interest groups whose primary members are other, narrower voluntary associations—and of ad hoc alliances among interest groups to achieve specific legislative goals. In order to make his research manageable, he chose to concentrate on business associations, particularly the national Chamber of Commerce.

At every turn, the author had doors slammed in his face. First, the Chamber of Commerce refused to discuss intergroup activities in which it engaged, and charmingly disclaimed that it ever did any such thing. At the time the research was being conducted, the Chamber was undergoing a three year-long audit by the Internal Revenue Service, and Chamber officials stated that the IRS might misuse such information to harass the organization.

As a result, Professor Hall had to rely on data of questionable objectivity: on interviews with former Chamber employees, on comments from leaders of interest groups which admitted that they cooperated with the chamber, on the self-serving publications of the group he was studying, and on exposé-type articles in popular magazines and newspapers. Furthermore, most of the people who did talk to Hall demanded anonymity and requested that their comments be sufficiently doctored to prevent any possible identification of their source.

Inevitably, one wonders whether all interest groups which engage in cooperative tactics are equally secretive about their activities, or whether groups which are highly defensive, such as business associations tended to be throughout the 1960's, are perhaps extreme in this regard. A hypothesis testing this relationship could be formulated in operational terms. Yet, because Professor

Hall chose to focus on business associations, the book does not raise questions of this nature.

Given the research limitations imposed by the cloak and dagger nature of his investigation, Hall has done a creditable job. The reader comes away from *Cooperative Lobbying*, however, with the feeling that much remains to be done in this field. The author mines the data available to him skillfully but, to put it simply, the data is not very rich.

It is important to add that Professor Hall does not generalize beyond the limits of his data and consciously avoids constructing theories about cooperative lobbying. His approach is straightforward. He spins no gossamer webs. As a result, this book will be most useful to undergraduates and others who are yet amateur explorers of interest group politics; it has much less of value for political scientists familiar with books like Truman's *The Governmental Process*; Bauer, Pool and Dexter's *American Business and Public Policy*; Milbrath's *The Washington Lobbyists*.

Let me illustrate the above point: *Cooperative Lobbying* begins with a chapter about lobbyists in Washington. The author admits that the ore from this particular vein has been pretty well extracted already, but he justifies his work on the ground that "a few non-scientific comments by newspaper reporters and lobbyists are still needed to fully describe current lobbying recruitment." He proceeds to rehash a number of recent popular magazine articles and, disturbingly repeats their jargon and some of their inanities. The chapter reads easily, but it detracts from the focus of the book.

The following two chapters concentrate on motives for and against interest group cooperation. Essentially, these chapters develop—in depth and with illustrations drawn from contemporary business interest groups—the reasons for and against cooperative action outlined in Truman's *The Governmental Process*. After 90 pages of analysis, the author concludes that "only a few generalizations can be drawn" and that these generalizations are "simple in nature." Two such conclusions are "Groups often cooperate to exchange information about issues and problems common to their perceived interests" and "Economic self-interest is one of the most compelling motives that activates interest groups."

The second half of the book offers the knowledgeable reader more substance. Professor Hall is clearly more adept at analyzing and writing about actual examples of cooperation among voluntary associations than he is at speculating about such vague phenomena as the "motives" of multi-member organizations. His chapter entitled "Methods of Intergroup Cooperation" makes worthwhile reading, especially for those interested

in studying the Washington activities of associations in the food industries.

Hall focuses on the Food Group, a twenty year-old informal conference group whose members include representatives of over sixty business associations. Officers of the Food Group tend to be men from associations like the National Institute of Fisheries, the National Canners Association, or the International Association of Ice Cream Manufacturers, but peak associations like the National Association of Manufacturers, the Chamber of Commerce, and the American Farm Bureau Federation also belong to the conference.

The Food Group claims to be simply an informal group which holds frequent lunches to discuss what is going on in Washington and to exchange information relevant to the interests of its members. Nevertheless, Hall found that the Food Group appeared to be the parent of a more formalized ad hoc interest group, the Information Committee on Federal Food Regulations, formed specifically to fight Senator Hart's "Truth in Packaging" legislation.

For example, the Chairman of the Information Committee, who had major responsibility for planning and executing the response of food industry members to the threat of Federal regulation, was simultaneously program chairman of the Food Group, a top-level executive in the National Canners Association, and a member of the National Association of Manufacturers.

Besides studying 1) informal groups which avoid structure, rules, organization, etc., and claim that they serve purely an informational rather than a pressure function and, 2) ad hoc industry groups, the author concentrates on what he calls the "conference association." He explores the Greenbrier Conference, an annual "summit meeting" of representatives of the major business associations and other generally conservative groups like the AMA and the AFBF, and the Conference of National Organizations, a somewhat broader organization which meets three-times yearly. Both of these Conferences exclude reporters, do not take minutes, nor make public the substance of their discussions. The Greenbrier Conference, in particular, tends to be highly influenced by the National Association of Manufacturers.

Given the secrecy of these Conferences, the author was unable to attend any of their meetings or to get wholly reliable information on their significance. He concludes, logically and I think correctly, that these secret summit meetings are not as nefarious as might be assumed, since they have built-in limitations; the groups which attend sometimes have conflicting interests and frequently disagree over priorities; frequently second and third-rank employees who have little or no

responsibility for policy-making within their organizations are detailed to "represent" their respective associations; the very secrecy which encourages free discussion and consensus-building prevents effective use of the results of the discussions in the political process. Strategy and tactics cannot be planned and carried out through the mechanism of broad summit conferences.

The final chapters provide brief case studies of "Intergroup Cooperation in Action." The conflicts over "Truth in Lending," "Truth in Packaging," and the Dirksen Reapportionment Resolution are examined by the author. About his last case Professor Hall concludes that the activities of the various groups can be observed and cooperation inferred but only the participants—none of whom is willing to discuss such cooperation—could actually document the existence of an alliance and the methods employed by alliance members.

Professor Hall would perform a valuable service for political science if he builds upon his present book and concentrates in his next work on attempting to research and write one or more in-depth case studies of group alliances in action. Furthermore, such studies should not be limited to business-oriented groups; an analysis, for example, of the Leadership Conference on Civil Rights might prove especially rewarding. A break-through is needed here, and Professor Hall may well be the one to achieve it.—ALAN H. SCHECHTER, Wellesley College.

Congress and Urban Problems: A Casebook on the Legislative Process. EDITED BY FREDERIC N. CLEVELAND. (Washington, D.C.: The Brookings Institution, 1969. Pp. 450. Cloth, \$7.50; paper, \$2.95.)

It is generally acknowledged that America has become a nation of cities. But although the extensive growth of large metropolitan areas on a national scale is a relatively recent phenomenon, urbanization and many of its attendant problems certainly are not without long standing precedent. It is rather surprising and a matter of no small interest that this fine collection of case studies edited by Professor Cleveland represents the first major attempt to analyze the challenge which urbanization as a field of public policy has posed for Congress. Why has a volume dealing with this important topic been so long in coming? The answer to that question reflects more upon the nature of American politics than it does upon the inclinations of American political science.

What emerges as the central theme of these studies (and particularly of Professor Cleveland's masterful concluding essay) is the delineation of a political system which is not yet structured at the national level to treat the problems associated with urban life as problems of urban life *per se*. It

is one thing to recognize that the United States is confronted with an urban crisis on a national scale and quite another to conclude that there ought to be a national urban policy which somehow addresses itself to that crisis. Institutionally, the recent establishment of both a cabinet level department and a White House staff for urban affairs may move the Executive branch in that direction. But as Professor Cleaveland points out, "there is little evidence that Congress has developed regular patterns of decision making where urban problems are concerned. To put it another way, Congress has not yet developed stable issue contexts organized around the notion of 'urban affairs policy.'" (pp. 358-59)

In addressing themselves to the problem so stated, Professor Cleaveland and his associates have made a major contribution to a growing body of literature which seeks to explain systematically the formation of public policies at the national level. Seven cases exhibiting varying degrees of "urban-relatedness" (Prof. Cleaveland's term) are presented—air and water pollution control, assistance for airports and mass transit, the establishment of programs to control juvenile delinquency and to feed the urban poor, and the creation of a department of urban affairs. Although a number of relevant and important legislative fields are not included (e.g., housing, urban renewal, and anti-poverty), students of Congress will find that the case studies describe well the extraordinary spectrum of legislative committees, executive agencies, professional staffs, and interest groups involved in urban policy making. More than that, however, these essays show how this complex structure of decision making tends to treat urban problems as non-urban issues.

In fact, the authors find urban policy making to be an almost capricious enterprise in Congress: thus legislation to abate air and water pollution bogged down in controversy over state enforcement powers and resource conservation; a proposed urban affairs department was defeated in 1962 when the House became embroiled in a racial controversy over the appointment of a Secretary; airport assistance was conceived primarily to promote the interests of commercial carriers, without reference to urban development; similarly, mass transit was not regarded as fundamentally urban legislation until the indifference of the Senate Commerce Committee virtually compelled supporters to turn to the more urban oriented Housing subcommittee on Banking and Currency; and the food stamp program, long regarded as a general welfare measure and as a means of reducing agricultural surpluses, became an "urban" issue almost gratuitously in 1964 when non-urban Congressmen used it as a means of bargaining for the urban support needed to save an unpopular farm

subsidy. Because Congress lacks a perspective on urban life and development as a whole, the urban element is often ignored, sidetracked, or treated as an incidental by-product of other concerns.

The judgment that there ought to be a reasonably explicit urban orientation or field of public policy at the national level provides the authors with a concept for ordering their analyses of decision making and serves as a standard for evaluating both the process and the policies produced. Of course it can be argued that as the nation has become increasingly metropolitan most public policies have acquired important "urban" implications. A field of urban policy would encompass so much of the legislative process as to become virtually synonymous with domestic affairs. Moreover, given the great and widely recognized influence which local governments and interests have in Congress, and the consequent tendency to make what the late Professor Morton Grodzins referred to as "decentralizing decisions" at the national level, it can be argued that the complex interests of urban America are powerfully represented in Congress. In fact, contrary to the widely held theses that effective legislative leadership has become an executive function, Professor Cleaveland observes that "these seven studies [demonstrate] the vitality of Congress itself as a source of initiative in legislating on urban problems." (p. 354) The real question, as the authors imply, is whether urban interests have been adequately or properly represented and legislated upon. Given the diffuse nature of metropolitan politics and the heterogeneous character of urban interests and group life, such a judgment is difficult to make. But complexity as such is not really the heart of the problem.

What is involved here is the impact of institutional or structural constraints upon the substance of public policy. In Congress the organization of authority systematically discourages the development of an urban field of legislation. It is not surprising that these studies are compelled to focus upon the character of the committee system, which almost invariably divides legislative responsibility on a functional basis that cuts across an areal phenomenon like metropolitanism. Such a system not only discourages the development of a comprehensive urban perspective, but distorts or conceals the urban dimension in individual legislative proposals. The seniority system exacerbates the problem by elevating to positions of authority many legislators from rural or small town constituencies which are unlikely to sensitize them to urban problems or interests. Under these conditions the principle or mechanism of representation, which is inherently divisive, cannot be relied upon to produce reasonably responsive urban policies. Even big city congressmen rarely represent

constituencies which are likely to encourage a comprehensive perspective on metropolitan problems. This is especially true of House districts, which usually divide urban areas ethnically, racially, economically, and politically.

The necessity of attracting the support of non-urban representatives further complicates the process since urban leaders must often compromise their legislative proposals and avoid defining issues in explicitly urban terms. Since it is the structure of authority which makes it virtually impossible to see or to treat urbanism as a complex whole, some reorganization fostering a broader perspective will have to be undertaken if Congress is to respond to the urban crisis in an enlightened manner. Professor Cleaveland suggests that at a minimum this would require creating House and Senate committees with legislative jurisdictions roughly equivalent to that of the Department of Housing and Urban Development. It might also entail the creation of a non-legislative joint committee with authority to review the urban implications of all relevant legislation—a function similar to that of the Urban Affairs Council in the White House.

The impact of institutional reform is always problematic. Even with the recent changes in executive organization and those proposed for Congress, certain fundamental features of American politics mitigate against the emergence of urban affairs as a stable, broadly conceived, and reasonably well defined field of national policy. Such a field would cut into the decentralized structures of political power associated with federalism, the party system, and the urbanized areas themselves. But the most important obstacle is the absence of an identifiable (let alone self-conscious) urbanized constituency in the welter of metropolitan interests, organizations, and political jurisdictions which make it difficult to mobilize support for urban policies at any level of government. The recently formed Urban Coalition may make some contribution in organizing such a support structure. Professor Cleaveland argues that urban based interests are so diffuse and difficult to organize that only the party system can supply the energy needed for defining, articulating, and supporting national urban policies. And he believes that "time is fast approaching, perhaps is now here, when the parties will base their appeal to [urban] voters on proposed national solutions to urban problems. . . ." (p. 389). But this is precisely what the parties have been unable to do well because they, too, are diffuse, disorganized and rooted in the very conflicts which obscure the perspective and obstruct the support needed for creating a national urban policy.

It may be an irony of the American system that if an urban constituency and support structure

emerge, they will do so primarily within the context of institutional developments at the national level. Although the structure of American politics makes this particularly difficult, a national government organized to legislate broadly conceived urban policies can provide the perspective and incentive needed to foster such support. But should this be surprising? Executive agencies and congressional committees typically contribute to the development of their own clientele groups. One must not underestimate the impact of institutional devices. That, after all, is the lesson which this book teaches.—LEO M. SNOWISS, *University of California, Los Angeles*.

The Contemporary Presidency. BY DOROTHY BUCKTON JAMES. (New York: Pegasus, 1969. Pp. 187. \$6.95.)

This is a relatively short study that claims to examine "the structure, uses and expansion of presidential power from the Roosevelt era to the present." (jacket) For the most part, it does. The author focuses on the demands and expectations of the modern institution, those forces that shape the character of the office and the roles of its incumbent. Routinization and institutionalization are described within the context of changing presidential responsibilities. The quagmire of personalized leadership in an increasingly bureaucratic system is presented.

It is a fruitful focus, one that breaks away from the traditional chieftain approach that still characterizes so much of the textual literature. The reader is presented with a systematic framework for understanding and evaluating executive policy-making. He is also presented with a concise summary of many scholarly writings. For these reasons *The Contemporary Presidency* should constitute a valuable introduction for most political science students.

It may not, however. It is very succinct; it summarizes a significant amount of published research; it provides insightful commentary. And it does all this in a body of a little over 150 pages. For a Ph.D. candidate intent on reviewing for his comprehensive examinations, such a compiliation might prove extremely useful and should be easily comprehensible. But for a student with only an elementary knowledge of the American political system, it is probably too compact and undoubtedly too advanced. It makes for difficult reading. On the other hand and to the author's credit, underliners would certainly be kept busy.

Perhaps the place for this book is alongside the Wildavsky collection of readings (*The Presidency*). Together they constitute a good anthology and synthesis of much of the Presidency literature. But used alone or with a less complete book of readings, *The Contemporary Presidency* may

be too brief and too sophisticated an introduction for most beginning students.

James concentrates the bulk of her analysis on the institutionalized aspects of the American Presidency. There is a chapter on the selection process, but it is not a very complete account. Similarly, the discussion on leadership is suggestive rather than informative. Personality theory is not explored in any detail. There are even some omissions in the institutional discussion, two of them serious. The author discusses the President's legislative role yet fails to explain the structure and function of the Office of Legislative Reference of the Bureau of the Budget. This is the office that is responsible for coordinating the clearance functions. She notes the need for strong executive leadership on the Hill yet does not describe the operation of the President's congressional liaison staff.

With these exceptions, however, the institutionalized Presidency is outlined in fairly complete detail. This is the book's chief merit. It examines structural-functional relationships within the framework of evolving responsibilities. James suggests that these evolving responsibilities set the parameters of presidential action and constituency reaction. She argues that the President is the prime mover in this process although the process itself is continual.

What is presented is a very mechanical model, updated from the Montesquieuian prototype. It has its checks and balances which the author suggests are operative. Others do act to moderate presidential initiatives but the extent of their moderation and the moderators themselves may differ.

In the domestic sphere Congress and the bureaucracy do the moderating. While they appear to exercise considerable power, James argues that the President can limit their impact by maximizing his own political power. Here she resorts to the familiar argument that a President must utilize his bargaining position to assume a role of leadership.

This argument, however, may obscure more than it reveals. Leadership itself is very complex. It does not necessarily follow from bargaining, although it can. The President's position can be persuasive, especially to those who have been socialized into believing that a chain of command exists, or more simply and to the point, that the President's wishes should be satisfied and his interests considered. It is the job of the White House staff to make these wishes and these interests known.

In the area of foreign and military policy James argues that the President is less restricted or at least, he seems to be. His constitutional prerogatives combine with his public position to create

the impression that he is limitless. The constitutional prerogatives that the author is referring to are those powers that provide for the Common Defense, powers as interpreted by modern Presidents rather than the Senate Foreign Relations Committee. James is of the opinion that the presidential interpretation will continue to prevail.

Nonetheless, the author does not conclude that Prometheus is, in fact, unbound. She hedges, suggesting restrictions of money, information and advice. In the final analysis, she adds, "... the greatest limitation upon Presidential initiative in foreign policy and defense is a personal one—his judgment and sensitivity to the strengths and weaknesses of the advice he is given." (p. 170) Vietnam indicates that this last limitation may not be too great. Besides, to say that the greatest limitation on presidential power is the President himself is to acknowledge that the external checks are not working, that there is no effective balance, that Prometheus can prevail under most circumstances.

This is one of the most critical problems—how to effectively check the President without at the same time preventing the efficient and often decisive formulation of foreign policy. The domestic Presidency faces somewhat the reverse situation—how to overcome internal constraints to meet an increasing number of institutional demands. For a President to succeed under these conditions, the author concludes, his sense of direction and style must be appropriate to the times. Unfortunately she offers no guide as to how Presidents can develop these attributes or how the electorate can determine who has them.

But this is probably asking too much. The author has given us a good book, substantial in content, fairly perceptive in analysis. Despite its difficulties for the beginning student, it is a useful addition to our textual literature.—STEPHEN J. WAYNE, *The George Washington University*.

The Idea of a Party System: The Rise of Legitimate Opposition in the United States, 1780-1840. BY RICHARD HOFSTADTER. (Berkeley: University of California Press, 1969. Pp. 280. \$6.95.)

Political scientists, historians, and sociologists in the last two decades have studied anew the phenomenon of the rise of open political parties. On this topic there are the writings of William N. Chambers, Noble E. Cunningham, Joseph Charles, Seymour Lipset and a number of others including myself. There also are a number of specialized works on the impact of parties in particular states. Various aspects have been emphasized by these writers and by earlier ones such as James Bryce, Marucie Duverger, M. Ostrogorskii and Charles A. Beard. Much attention has been given by the above authors to matters such as party structure,

some aspects of ideology and theory, and to the socio-economic base of politics.

Now we have Richard Hofstadter's book, also focusing on the rise of American parties. Hofstadter's approach is that of emphasizing intellectual history in the comparative setting of English and American ideas on parties. But he also focuses on the importance of the *acceptance* of parties in practice. For this purpose he stresses the significance of the struggle in the presidency of John Adams, 1797-1801, for the establishment of the right of an opposition party to exist. While he feels that the peaceful transition of power to the opposition in the election of 1800 is indeed an important land-mark, yet the central struggle about the opposition party's right to exist was won in the Adams period. Too much attention, he believes, has been given to Jefferson in power, not enough to the significance of the rise of the opposition.

This is the more important when we consider his carefully chosen material on the original ideas of our founding fathers. Their use of the term political party is carefully traced, both as to British and American usage in the eighteenth century. The terms "party" and "faction," as used by virtually all writers, were derogatory. Edmund Burke was a leading exception. His definition was: "Party is a body of men united for promoting, by, their joint endeavors the national interest upon some particular principle in which they are all agreed." This definition while deficient in certain aspects, did show recognition of the necessity of parties in a representative system of government. But the predominant view of the founding fathers was rather in agreement with Bolingbroke. Bolingbroke regarded factions as natural, but as being harmful. He, in his *Idea of a Patriot King*, wrote that statesmen and leaders must rise above party, even as they functioned. True leadership could not consist of just moulding the parties to support a program. This was the outlook of our own founding fathers in their writings. James Madison, in the famous tenth number of the *Federalist Essays* foresaw the rise of local and state parties but believed they should be neutralized and localized, not used as a structure for nationwide political programs. The Constitution itself reflected this point of view. It was intended to be, as Hofstadter puts it, "A Constitution against Parties." This same point of view was held by President Washington. In his presidency he sought to ignore parties. His first cabinet, in which both Jefferson and Hamilton served, was an attempt to establish a ministry of all the talents. But before long the proposals for programs and policies created divisions. Moreover to support his program, Hamilton organized support in what became the Federalist Party.

At this point Madison in Congress abandoned his support of the administration and Jefferson soon left it. But neither the administration nor the opposition clearly saw what was transpiring. It was not apparent that new institutions were developing. Rather there was the belief (by the opposition) that administrative errors needed to be corrected. In the administration Washington felt hurt. Hamilton ultimately felt that the opposition should be suppressed. As many of the Federalist Congressional leaders shared this point of view, it was in this spirit that in the Adams administration the Alien and Sedition laws were enacted.

After the election of Jefferson the role of parties was still not clear. Jefferson, most of the time hoped still to eliminate parties, to harmonize, to reunite. He saw the forces for development of some political opposition but was reluctant to institutionalize it, even in concept. He hoped to unify support. Ultimately Monroe came closer to achieving a momentary appearance of such unity, but the social, economic and personal forces for realignment and change immediately caused the rise of a new set of parties. Here Hofstadter finds the model for this in the work of Dewitt Clinton, and of the Albany regency. These forces in New York were typical of forces which produced the rise of a new set of parties. The new system of parties was analyzed in the writings of Martin Van Buren, especially his writings after leaving the presidency. To Hofstadter, the termination of his book is justified with the institutionalization of parties under Van Buren in 1840. By that date the concept, role, organization and activities of parties were clearly developed. The operation of the Constitution had been modified. The role of political parties was fairly clear and acceptance of parties was becoming general. Thus the writing about parties caught up to the actuality. The contribution of political parties to self government was no longer one of suffrage.

In summary, Hofstadter has confirmed some concepts, modified others, clarified many and developed some new departures, as outlined above. His book is a definite contribution and one which students of parties as well as students of theory will find quite important. Yet, the approach through intellectual history does have certain limitations. Both in this work as in earlier ones Hofstadter finds Madison more satisfying as an intellectual leader than Jefferson. I believe a change in perspective as to the political actions and leadership of each should reverse this judgment (p. 212). A reading of the newspapers in addition to the reading of the writings of the leaders would change some other points of emphasis. Also on the development of the Clintons and some other points on New York politics there is confusion, as between George Clinton who was still Governor in

the early 1800's and then United States Vice President, and Dewitt Clinton, with the result that Dewitt Clinton's career is telescoped with the later career of his uncle (pp. 221-222). This is chiefly of importance as indicating the necessity for a grasp both of ideas and also of practical politics to reach a balanced evaluation of leaders. Hofstadter is less at home in attempting such synthesis although he rightly sees the importance of such materials.

Finally there are theoretical questions beyond the scope of this book. Is there such a matter as the national interest? If so how does it evolve from the party struggle? Also for self government to function in an old or new nation, a basic consensus is probably necessary on the existence of the state and on what the British call "the rules of the game" as to how elections, the right of opposition, and the yielding of office are to take place. But all this cannot be done in a single book. Meantime, Hofstadter has made a valuable contribution, and has written an interesting and readable book with many new perspectives.—MANNING J. DAUER, *University of Florida*.

The Negro in Maryland Politics 1870-1912. BY MARGARET LAW CALLCOTT. (Baltimore: The Johns Hopkins Press, 1969. Pp. 199. \$7.95.)

Dr. Margaret Law Callcott has delved beneath the surface and exposed in a most glaring manner, a fallacy, "Negroes do not vote." She dispelled this notion and this oft-times used or misused statement by tracing the history of the Negro in Maryland politics from 1870 to 1912, and finding that Negroes *did vote* and *still do* in the Free State. With meticulous care and consummate skill she examined the voting records of the counties and Baltimore City in election after election during the period under review to lay bare the facts. The book is replete with charts and is well documented. But, above all, it is written in a pleasing style. By any measuring rod it is sound scholarship at its best.

The book is not only a significant contribution to courses in political parties and the electoral process, political behavior, and political dynamism, but to Negro history. It should be required reading for leaders of both political parties in the Free State, but particularly for Negroes themselves. It certainly provides Negroes an opportunity to review the past, reassess the present, and chart the future. Negroes can well say—"Stormy the path we've trod, bitter the chastening rod. Let us march on till victory is won."

The historic position of the Negro in Maryland politics is a rather strange phenomenon, full of paradox and irony, simplicity and complexity, mystery and meaning, public injustice and poetic justice. His influence on Maryland's political systems,

structures, events, and public policies have been profound, central, and universal. In a very real sense, the Negro has been the key to Maryland politics since 1870. Since the political system determines who gets *what*, *when*, and *how* the fruits of political power are many and varied. Conflict is the heart of politics. A political system is creative or destructive in accordance with pattern and quality or response to basic problems and dimensions of human conflict.

It is safe to say that the Negro was wedded to the Republican party in Maryland from 1870 to 1936. His enfranchisement heralded a new era for the Republican party in Maryland, changing a seemingly hopeless minority party into an organization of real power. Negro membership in the party freed it from the confines of sectionalism and provided it with a constituency of varying size and steady loyalty in virtually every county in Maryland. The Negro was led to believe that the Republican party was his chief benefactor and only protector. For while the Negro was underrepresented and undervalued in proportion to his electoral strengths, he was at least accorded a place and recognition of sorts in the Republican hierarchy, which was more than he was offered by the Democratic party of Maryland.

Negroes were also slighted in the distribution of party patronage. Likewise, they were denied real influence in party councils. They had little to say about the jobs at the party's disposal. Yet, patronage is the life blood of political parties. Therefore, the oppressed status of the Negro in Maryland political life represented his victimization and exploitation of something precious and sacred to white Marylanders. The raping of Negroes by the Maryland political process was, therefore, born of and nurtured by the search for meaning as well as the will-to-power. There was, in fact, a marriage of the will-to-meaning and the will-to-power.

Laboring-class Negro Republicans could count some tangible rewards for having their party in power, but the middle class and upper class Negroes were slighted by Republican patronage policies. They still are in 1969. The Maryland delegation is split down the middle as far as party alignment is concerned and yet no Negro Republican has ever received a top level federal or state appointment. During the 1950's Maryland had a Republican governor, two United States Senators, and three members of Congress flying the Republican banner—all elected by Negro votes. The Maryland Republican leadership has not learned a thing in one hundred years with respect to significant patronage federal or statewide. Apparently it has lost one of its national commitments. This certainly is no way to win friends and influence others.

On the other hand, *racism* was the major

weapon in the Maryland Democratic party's arsenal. Race, in its many manifestations was the chief source and expression of conflict and tension in the life of this party during the period under review. *Gormanism* then was what *Agnewsticism* is now. Exclusion, oppression, suppression, and victimization of Negroes were the chief methods and techniques of the party in dealing with racial conflict and tension. Regulation, adjustment, accommodation, and resolution of conflicting interest were accomplished by the mobilization and application of "White Power." The system not only fostered but celebrated and glorified collective hypocrisy, conceit, egoism, and dishonesty. It still does. Majestic principles were invoked to justify reduction of Negroes to the status of subject and victim of the political process. Lip service was dutifully paid to democracy even as Negroes were excluded from the experience of every element of citizenship.

Fortunately they did not prevail. The Republicans learned something about both the strengths and weaknesses of their racially mixed party. They learned they could achieve power with the Negro in their ranks. This, too, the Maryland Democratic party learned in later years. Due to numerous changes in the political landscape the Maryland Negro is much nearer the shore of political equality. A new day has dawned in the political and governmental life of the state. For the Negro, then, reading Margaret Law Calhoun's *The Negro in Maryland Politics 1870-1912* should keep alive within him the memories of the past, the good experiences of the present, and the grand visions of the future.

Because of increased participation, Negroes are developing a reservoir of political experience and increasing their political confidence and skill. They can help redeem the past of the Maryland political process. They can be liberating and redemptive agents, just as the Negro was the key to the party's emancipation. Freed from the prison of racism, the Maryland political scene will be freed from the heavy yoke of deceit, hypocrisy, negativism, and obstructionism.—ROBERT LEWIS GILL, *Morgan State College*.

City Politics and Planning. By FRANCINE F. RABINOVITZ. (New York: Atherton Press, 1969, Pp. 192. \$6.95.)

The dependent variable being examined in this volume is "planning effectiveness." Initially, the design states that variance in effectiveness is to be explained in terms of organizational difference (independent or executive planning operations), variation in the role of the planner (technician, broker or mobilizer) and political system differences. The latter variable is conceived, with some qualifications, as a pluralist-elitist continuum. The ex-

ploration is ostensibly to take place using data from six New Jersey municipalities. However, something happened between the research proposal and the field. The ensuing problems are so severe that the usefulness of the volume is drastically impaired.

The first problem and the one which nearly wrecks the study is the lack of a dependent variable which can be satisfactorily operationalized. Evidently, the original plan was to measure effectiveness by contrasting city plans and subsequent realizations. When this strategy did not work out, a substitution was made of using informed judges to rate the six cities. This was done dichotomously, ending with a list of five effective cities and one one-effective city. After reading about the cities' experiences one wonders about the charitable proclivities of planners judging other planners. Aside from the crudeness of the ratings, the result creates a cell with one case, which in turn limits the ability to make statements. As the "effective five" turned out to have inconsistent characteristics with respect to role, organization and system, the original design was abandoned.

The study then shifts to constructing, in a rather ad hoc fashion, a typology of political systems based on the six cities. Three indices are employed to arrive at a "banded continuum" with designated stripes. These dimensions are power distribution, political culture and output, each hoary concepts indeed. There is no discussion of how they are to be measured and there is precious little indication of how the three dimensions are employed to come up with bands called cohesive, executive centered, competitive and fragmented systems. Given the number of cases and the procedures employed these are in fact tantamount to pseudonyms for the properly named cities. The classification is arrived at largely by impressionistically characterizing prominent attributes which came to the mind of the researcher. Based on the evidence presented the types are convincing, but there is no way to check on this.

The final section is devoted to a discussion of political strategies employed by the various planners and the fortune of these strategies in the various system contexts. This passage is informed by a kind of participant observer insight and judicious common sense. It furnishes highly recommended practical advice for those engaged in planning.—OLIVER P. WILLIAMS, *University of Pennsylvania*.

A Constitutional Faith. By HUGO L. BLACK. (New York: Alfred A. Knopf, 1969. Pp. 97. \$3.95.)

In this compact little work, a compilation of lectures delivered in 1968, the aging Justice Black at last offers a book-length statement of his guiding judicial principles, which he calls his "constitu-

tional faith." In characteristic style he wields his pen like a sword, cutting swiftly through massive constitutional subjects, always tough-minded and keenly devoted to his ideals. Brushing aside the now fashionable claims that he is a New Deal liberal, whose recent opinions show that he has turned sour and conservative with age, Black assures us that his basic tenets have never changed, only his application of those tenets to the circumstances—a claim over which Blackophile and Blackophobe writers are sure to do battle.

The Justice's principles of jurisprudence are presented in three lectures on (1) the constitutional role of the courts; (2) due process of law; and (3) the first amendment. He holds fast to his familiar positions on the incorporation of all Bill of Rights guarantees into the fourteenth amendment and on his "absolutist" interpretation of the first amendment, guarantees of liberty of expression. The unifying theme that laces together these and other arguments is that judges are obliged rigorously to adhere to the original meaning of the Constitution as seen in its plain words and in the historical conditions of its drafting. Accordingly, Black's repeated lament is that his brothers too often arrogate to themselves the power to change the Constitution by interpretation, while their true obligation is to "follow the true meaning of the Constitution and other laws as actually written . . . leaving the problem of adapting the Constitution to meet new needs to constitutional amendments approved by the people under constitutional procedures." (p. xvi). Contemporary legal scholars are likely to label this a quaint version of "strict constructionism," since long-accepted theories of judicial legislation emphasize the sense in which judges are independent agents who make law rather than merely find it, as Black seems to be saying. But quaint or not, Black's theoretical statement takes on new relevance today with the recent election of a President who campaigned heavily on the theme that courts ought not to legislate and who appointed a supposed "strict constructionist" as Chief Justice.

Unfortunately for Black, the conviction of his writing style is not matched by the substance of his arguments. He advocates a close following of the literal wordage and the historical context of the constitutional provisions; but, his interpretations of some provisions are faulty, it seems to me, on just these points. To take one of the most glaring linguistic problems, Black maintains that the first amendment accords unconditional protection to "speech," but adds that this does not include direct protection for civil rights demonstrations since they are not engaged in "speech," but are "conduct." He says it is "speech," not "conduct," that the amendment explicitly protects. But does this not cavalierly overlook the presence of

the same provision of rights of "assembly" and the "exercise" of religion?

How can one make any sensible construction of these words without allowance for "conduct"? Some of Black's arguments about historical context are equally dubious. For example, not many reputable scholars have accepted his "incorporation" theory of the intent of the framers of the fourteenth amendment. And the Justice stands virtually alone in his absolutist interpretation of the first amendment (an interpretation which, he tells us, would strike down every defamation statute in the country). Indeed, Leonard Levy's thoroughgoing historical study, *Legacy of Suppression*, may put to rest once and for all the notion that the Framers had any idea of Black's absolutist first amendment.

Finally, it must be said that Black, for all his personal greatness and intellectual power, makes the fatal mistake of trying to resurrect dusty theories of mechanical jurisprudence which obscure the realities of judicial discretion. Even if the Justice's use of words and history were sound, his literal approach to adjudication would still be inadequate since it greatly overestimates the fixity and certitude of the meaning of legal documents, especially of the conveniently vague phrases of the Bill of Rights. The Justice is eloquent, but not persuasive in his attempt to get us to shelve Justice Holmes' maxim that courts "do and must make law."—PATRICK MCBRIDE, *Sacramento State College*.

New Jersey Reapportionment Politics, Strategies and Tactics in the Legislative Process. BY ALAN SHANK. (Rutherford, N.J., Fairleigh Dickinson University Press, 1969. Pp. 308. \$10.00.)

"A specter is haunting the United States—the specter of reapportionment" Alan Shank opens his book on this off-key note and ends it by reciting dreary details of the procedures for apportionment established in 1966. Along the way he presents much detailed information on legislative apportionment controversies in New Jersey, particularly in the twentieth century. He also makes an attempt to relate the strategies of the antagonists in these legislative struggles to the various models of coalition formation that have been developed in recent years. To that end Shank has painstakingly calculated the indices of likeness and of cohesion of various groups in the legislature, particularly county and party factions. Apparently Shank means to use all this to say something about New Jersey politics in general.

My impression is that the book rides off in all these directions. There is scant effort to bring the elements together in any meaningful whole. If, as sometimes appears to be the case, this is intended primarily as an attempt to show the applicability

of theoretical models to real politics, the result is not impressive. For one thing little space is allocated to it. The potential application of the models of Schelling, Buchanan-Tullock, and Downs is summarily dismissed—one paragraph apiece. Riker's minimum winning coalition model is found more applicable, but the ten pages devoted to showing instances where Riker's model would apply do more to whet than to satisfy the appetite. If, however, none of these was Shank's prime goal, and his purpose was to say something significant about New Jersey politics by commenting on reapportionment as an illustrative case, then, alas, the case became the leading actor and the original objective was shunted aside.

As a dissertation it merits the Ph.D. degree that it helped to get for the author; as a book it illustrates once more that publishers are more anxious to produce books than they are to hold to appropriate standards of publication.—DUANE LOCKARD, *Princeton University*.

Governing the City: Challenges and Options for New York. EDITED BY ROBERT H. CONNERY AND DEMETRIOS CARALEY. (New York: Frederick O. Praeger, 1969. Pp. 230. \$7.00.)

Several of the papers in this book were written for a conference in May, 1969, which was jointly sponsored by the Academy of Political Science and the Urban Center of Columbia University. Professors Connery and Caraley have performed a difficult task well—editing a series of diverse papers by a group of diverse authors. The number of papers (eighteen) makes it impossible to examine all of them here, but those that are mentioned below and others make *Governing the City* a worthwhile addition to the literature of New York City politics.

Part of the volume deals with the city's governing process. Included are papers by Wallace S. Sayre and Herbert Kaufman, the co-authors of *Governing New York City*, a monumental book for which *Governing the City* is a timely supplement. Sayre's "City Hall Leadership" focuses on the mayor and his relationships (poorly developed, in Sayre's opinion) with the other main elements of the city's fragmented power structure. Sayre suggests that "the city is not likely to find a shorter or more satisfactory road to a more responsible City Hall leadership than rebuilding the party system" (p. 39). Arnold J. Bornfriend in his "Political Parties and Pressure Groups" indicates why rebuilding the city's now impotent parties will be difficult, although his perceptive description of the city's new pressure group system indirectly lends support to Sayre's position. Bornfriend suggests that the currently intense conflict between primarily black and Puerto Rican "new-comer" groups and emerging "backlash" groups will not ease until the city's benefit sector is ex-

panded—an unlikely development in the absence of more inclusive hierarchies capable of extracting resources from larger governments and of increasing the quantity and quality of bureaucratic outputs.

Herbert Kaufman examines bureaucratic politics in "Bureaucrats and Organized Civil Servants" and focuses on municipal employee unions, among the most important of the many roadblocks to responsive government in New York City. There can be less disagreement than Kaufman seems to think with his suggestion that "the principle of joint management-labor administration attained and then abandoned in West German labor unions has been approached as normal practice in the government of New York City" (p. 43). On the basis of my own research on the city's labor relations it seems to me that Kaufman understates the influence of the organized bureaucrats and overstates the potential of emergent countervailing groups to restore public control over the bureaucratic process.

Governing the City also contains several good papers examining some of the broader systemic variables affecting the city's decision-making process and capabilities. The nature and implications of the city's complex and changing demography are discussed by Emanuel Tobier in "People and Jobs." David Bernstein's excellent "Financing the City Government" describes city expenses and revenues and along with Vernon M. Goetcheus' "State House and National Capitol" illustrates the city's reliance on and need for massive financial assistance from the state and national governments. The sheer magnitude of the city's functional responsibilities are concisely spelled out by Bruce Feld in "What the City Government Does."

The papers treating the city's major problems demonstrate that New York City's populace bears considerable hardships because of the city's governmental inadequacies. Separate papers treating recreation, education, crime, health, housing, poverty, and city planning all document the city's inability to focus enough resources and authority to resolve, even ameliorate, many of the conditions which make the city an undeserved burden for so many of its residents. As Roger Starr so aptly puts it at the conclusion of his excellent paper "Housing the City's People": "The challenge is there. Where is the power?"

That's a good question and one which the city's political leaders and chroniclers had better start confronting very soon. Co-editor Caraley in the concluding paper "Is the Large City Becoming Ungovernable?" deals with Starr's question from a national perspective. Caraley suggests that the power to govern large cities depends on the mobilization of national resources and that there is a potential "pro-urban" coalition capable of generat-

ing enough influence in Washington to assure requisite resources for urban development. After all, Caraley argues, a country which can win world wars, support worldwide alliances, develop nuclear weapons, and put men on the moon has the resources to accomplish a great deal. The rub, of course, is that the American people may not want to develop viable urban areas in which people of different races can live and work together. Furthermore, given the condition of New York City's fragmented governing process, one can question whether it is capable of converting substantially greater resources into consequential outcomes.

Caraley's optimism may be excessive, but his paper provides some balance to a book which is destined to send most of its readers into Spenglerian fits of doom about New York City's future. Actually, New York City's problems and prospects are more the same than different from those of most other large cities; if its problems are greater in magnitude and its options more limited, this is partly because New York City has made errors which other cities (and perhaps New York) still have time to correct. *Governing the City* documents a lot of these errors, but what it really does is to effectively underscore the first principle of most American urban political systems—urban governments are hardly the captains of their own ships. —RAYMOND D. HORTON, *Grinnell College*.

The Quest for Regional Cooperation: A Study of the New York Metropolitan Regional Council. By JOAN B. ARON. (Berkeley: University of California Press, 1969. Pp. 225. \$7.00.)

The most recent innovation in metropolitan governmental organization is the voluntary association of local governments, usually a council of elected officials, established to study area-wide problems and to discuss proximate solutions. The first such council of governments (COG) was organized in 1954. By March, 1968, encouraged by Federal financial support, the number of COG's had grown to ninety, with twenty others in various stages of formation.

Joan Aron's study is a history and analysis of the effort to establish a workable COG in the nation's most complex metropolitan environment, which in 1961 included over 1400 distinct political units and was designated by Robert Wood as "one of the great unnatural wonders of the world."

Briefly stated, the New York Metropolitan Regional Council (MRC), established in 1956, moved to a plateau of limited regional activity in the early 1960s and declined in importance after 1964, when it abandoned its efforts to gain legal standing as an organization of *communities*. In 1966 an attempt at rejuvenation was begun. At that time MRC was incorporated as an organization of elected *officials* to secure Federal funds under the Housing and Urban Development Act of 1965. By

March, 1968, when the research for this study was completed, MRC was attempting to establish itself as a viable regional organization.

Aron's comprehensive case study shows that during its formative years MRC suffered problems common to many COG's in the United States. There was no consensus among members as to what MRC's regional role should be. Shifts in membership occasioned by electoral outcomes, together with a general lack of money and professional staff, made leadership formation difficult. Because of goal confusion among local officials, MRC was often unable to communicate effectively with suburban governing boards and State legislatures. There was apparently no attempt to identify issues and personalities which could break the usual public apathy surrounding regional concerns. The Council was attacked from all sides: some critics charged it could never become a political unit of real force, while others claimed MRC was the harbinger of metropolitan "super-government."

In addition, MRC encountered a special obstacle in the particular governmental conditions of the New York region. Unlike many other States, the governments of New York, New Jersey, and Connecticut have been urban-oriented for some time and have attempted to meet several problems on a regional basis. But these efforts have been concentrated upon *functional* arrangements (e.g., Authorities) rather than general-purpose structures. MRC was unsuccessful in its attempt to change this State practice.

Faced with internal dissension and external hostility, MRC's accomplishments were "more good intentions than anything else." The Council supported proposals concerning regional transportation, the preservation of open space and recreational lands, and an air-pollution warning system. The organization also served as an arena for informal negotiation of some regional problems requiring action by several local governments. Although MRC served over the years as a useful device for the exchange of knowledge among local officials, it lacked the political resources to deal with continuing regional issues. When a problem became pressing in the Region, governmental authority was needed. This power rested with the States and they were unwilling to share it with MRC.

What is the future of governmental cooperation in the New York area? Aron sees no "supergovernment" for the Region. The Authorities will continue to furnish the most critical area-wide services. Any initiatives for regional coordination must come from the States or the Federal government. If MRC is to develop as the representative of local units in the planning and governing of the Region, the author feels that it must develop leaders who can establish meaningful relationships

with the principals in other regional organizations—Federal and State agencies, the Authorities, and private planning agencies such as the Regional Plan Association.

In the end, therefore, "cooperation" is still the watchword in the New York metropolitan area, just as it was when Wood examined its governments nine years ago. Any change must await future events. The author concludes:

MRC is not an ultimate solution. But it may provide the metropolitan community in New York with its first demonstration that local governments can play an effective part in shaping their own destinies.

In the opinion of this reviewer, such a demonstration, if it develops, will rest upon new initiatives taken during the 1970s rather than the limited past achievements of MRC.

This case study is a significant contribution to the literature on metropolitan councils of governments. While it deals with a metropolitan region which is perhaps unique in its composition and complexity, the work provides valuable data for future comparative research in metropolitan governmental organization.—ROBERT E. MCARTHUR, *Vassar College*.

COMPARATIVE GOVERNMENT AND POLITICS

Political and Administrative Development. EDITED BY RALPH BRAIBANTI. (Durham: Duke University Commonwealth-Studies Center. 1969. Pp. 667. \$15.00.)

There are fifteen essays here each specifically prepared for this volume. Three of the essays are critiques of selected sister contributions and one of them is a "conspectus" that summarizes and correlates the materials in the eleven primary pieces. Needless to say, any work of this range and variety of authorship (prepublication prose-minar notwithstanding)—is inevitably uneven in quality. Moreover, the degree to which different pieces may strike responsive chords in the reader probably depends as much on the instrument being struck as on the intrinsic merit of the essays themselves. In my own case, for example, I have not been in a sympathetic mood concerning the entire area of this book for some time. Basically my pessimism stems from an uneasy suspicion that much of the recent wisdom of public administration in general, might best be characterized as reinventing the wheel. And in the case of *development* administration it is a reinvention preceded by an agonizing appraisal as to whether you really need wheels. The entire enterprise is then packaged in such scholasticism that it takes considerable courage to suggest that all too often the emperor is naked. But this is an indictment of the state of the discipline and of all of us who continue to live within its confines rather than a thrust against any of these authors in particular.

Indeed, a number of the authors themselves indulge in embarrassed asides. Palombara, for example, states his central theme: "that certain values, ends-in-view, or ideologies carry with them implications for an administrative organization that would not be relevant or necessary were the values and goals of ideologies different," before he notes that "Although this observation appears truistic, it seems to me apparent that like many other truisms about public administration that might be enumerated here, it is not fully under-

stood by contemporary nation builders and by those who provide them with 'technical assistance.'"

Perhaps the reader might better evaluate for himself the strength of the volumes connective tissue, the interest level of the various themes and the prose style most typical of the essays from the following excerpt by the editor of the book and its lengthiest contributor, Ralph Braibanti: (This statement is from his "Conspectus" and is preceded by a demurrer concerning the volume's failure to present a unified model.)

"Despite the foregoing remarks, there appear to have emerged the glimmerings of a common perspective with respect to the purposes of development, the configurative or ecological tissue in which administration is embedded, the indigenization of political institutions, and the insistence on typological schema, however obscure and complex they may be, by which subsequently comparative evaluation may be made. Apart from what appears to be a group of not greatly divergent points of view toward these problems, there are on some issues conflicting emphases, uneconomic variations in terminology and constructs and varying perceptions of the same problems of political and administrative development."

This, apparently, is where we all are.

I will not, however, further emphasize the negative, but instead call attention to a few pieces that are in and of themselves worth the price of the book. Ralph Braibanti's opening essay, for example, provides an excellent review of the literature of development administration as well as a most timely reminder of the pitfalls of our foreign aid program. His major thrust is to emphasize the central importance for development administration of ongoing political institutions in terms of their general ideology, spread of power, institutional regularity and innovative capacity. He provides classificatory handles to aid in evaluating such institutions and also expresses the hope that through a careful balancing of administrative activities in relation to the activities of other sectors in the polity, the satisfaction level as well as the performance ability of administrative organizations will be raised.

In his final "Conspectus," moreover, Braibanti performs the Herculean task of compressing the ideas of his colleagues into an accurate and thorough set of precis, followed by an overview of the general themes and interrelationships found in the volume. This virtuosity is particularly helpful since the reader is likely to approach the book piece by piece. If there are timelags between the reading of one essay and another, it is inevitable that possible relationships will slip past unobserved. Braibanti's review, therefore, presents us with exactly what we may have failed to do for ourselves.

Another particularly useful portion of the volume is the interchange between Fred Riggs and Martin Landau. Riggs sets forth a richly imaginative schema of politics and bureaucratic subsystems. He places these against a complex backdrop of ecological settings, and a threefold classification of what he calls "transformations" whose consequences he subsequently explores. In and of itself this is an interesting essay. Landau's brilliant criticism, however, actually illuminates it. He deals with Riggs's conceptualizations and with his special terminology. This portion of the book could well serve as a model for teachers and students alike on how to analyze political science contributions. It is intellectual surgery at its best.

The themes that run through the book are essentially a counterpoint among ways of looking at institutions, values and persons. The authors vary in the emphases they place on each of these modes, as well as in the constructs they provide for analyzing them. For example, Friedrich together with his critic, Sartori, explores the problems and rewards of studying the ends of government in our political and administrative development work. Palombara discriminates between the drives that led to the development of the Weberian type of continental bureaucracy in distinction to those that led to the British-American systems and draws analogies for the more complicated field of the developing countries. Lasswell and Holmberg provide an eight item classification of values (neatly arranged into a mnemonic device) and then add a six-fold set of implications that the model might suggest for developing states. Kariel's essay enumerates a stimulating array of literary allusions that entertain as they illuminate problems in the field through varying definitions of "man."

But attempts such as this to encapsulate the various authors does a disservice to most of them. In essence, all the authors are struggling toward those insights that might best provide *all* nations, not just those variously defined as "developing," with some sense of direction and order for their political systems. The book on the whole, is a fair representation of the thinking in the field and on

this basis deserves the consideration of the profession and the neophytes.—BLANCHE DAVIS BLANK, *Hunter College*.

The Angolan Revolution. Vol. I: The Anatomy of an Explosion (1950-1962). BY JOHN MARCUM. (Cambridge: The M.I.T. Press, 1969. Pp. 380. \$12.50.)

In Angola the presence of Portugal and its imperial mystique has been challenged for centuries by the black African. The challenge has taken the form of sporadic outbreaks of resistance and rebellion, such as the uprising of Alvaro Tulante Buta during 1913 to 1915 in protest against labor conditions and the deportation of Africans to Cabinda, São Tomé, and Príncipe. Protest also took the form of nativist or messianic mass movements, especially in the Portuguese Congo after the colonial breakup of Bakongo territory in the late nineteenth century. It was manifested through *assimilado* protest writings, newspapers, and cultural journals as well as through official and semi-official African and European organizations. More recently, the opposition to Portuguese rule crystallized into tens of ephemeral nationalist movements among which a few represent a serious threat to Portugal's hold over the territory.

John Marcum has given us a detailed account of these movements, their origins and evolution from 1950 to 1962. A promised second volume will cover the period from 1962 to 1968. Marcum's account is based on personal experience and insight, interviews during the past ten years with nationalist leaders, and thousands of ephemeral and secondary sources.

The present volume is divided into three parts and concludes with four useful appendices of documents. The first part deals with the rise of Angolan nationalism during the decade preceding the revolt of early 1961. This period of nationalism is analyzed on geographical and ethnic lines focusing, first, on the Luanda-Mbundu sources represented by the Movimento Popular de Libertação de Angola (MPLA), the Marxist revolutionary movement which evolved from the earlier intellectual *assimilado* and mulatto protest. A second focus is on Bakongo sources of nationalism in northern Ongola where dissent in the Congo monarchy is led to the formation of several movements under the leadership of Holden Roberto. Third, there are the Ovimbundu, Chokwe, and related sources of nationalism in the southern half of Angola, from which a third force later evolved during the mid-sixties. In each case Marcum meticulously explores the roots and causes of nationalism, identifies the principal personalities, and analyzes the ideology, organization, and significance of the many movements in relation to the open rebellion of the sixties.

The second part of the book concerns the uprising of 1961, the year of rebellion and "sequential explosion." Citing both nationalist documents and Portuguese sources, Marcum reconstructs the series of events, commencing with the attacks in January by members of a sect known as Maria, the Luanda riots and vigilante reprisals of February, and the upheaval of March 15 which thrust Angola into a protracted state of rebellion. He also examines the American and Portuguese responses to the conflict as well as the impact of the rebellion on subsequent developments in Portuguese Guinea and Mozambique.

The third part examines in depth the period leading to the 1962 formation of a government in exile and the effort of nationalists to cement relations and gain support in independent Africa. The effort to form a broad national front from ideologically diverse movements is analyzed with particular attention given to Roberto and the MPLA. Marcum concludes with an assessment of the rebellion in terms of the Portuguese commitment, Portugal's links to Western allies through the North Atlantic Treaty Organization, the opposition to Portuguese colonialism in the United Nations, and the potential of pan-Africanism.

The appendices of documents concern the uprising of Tula Alvaro Buta and biographical notes on Agostinho Neto, leader of the MPLA; two Portuguese documents on alleged Communist subversion; three documents on the relatively unknown struggle of African factions to control the old Congolese throne; and Roberto's forged letter published in *Reader's Digest* as the result of Portuguese public relations effort.

Marcum has gone to considerable trouble to give us a balanced account of these chaotic events and to clarify details which have been badly confused by the divergent positions of the nationalists and Portuguese and by an often inaccurate press. One is especially impressed with the descriptive detail and event by event analysis, depicting the intricacies of nationalist politics. Rather than providing the reader with startling new interpretation and analysis, this book constitutes a necessary synthesis of contemporary political history with deep political insight.

This study is largely dependent on ephemeral nationalist documents which the author has had to weigh carefully. For example, he boldly documents the founding of the União das Populações do Norte de Angola, (the predecessor to Roberto's own movement) as late as in July 1957, some three years later than that officially documented by the nationalists themselves. Through interviews (with the participants involved in the founding of the movement) and inconsistencies in the nationalist documents, Marcum is able to revise the date and recast the historical perspective of Angolan

nationalism in the Portuguese Congo. In certain instances, one senses the author's uncertainty and frustration in dealing with disputable facts. Marcum goes to great length to discuss obviously biased and distorted propaganda emanating from all sides of the struggle.

While this study might be viewed critically by some behavioralists concerned with systematic and quantitative field analysis, it should be emphasized that due to present political conditions such analysis probably could not be undertaken in Angola today. Marcum, it would appear, has ventured into a study of events which are still much too close for detached assessment. Yet his book remains a highly successful synthesis of events as they probably happened. This very necessary study fills a gap which should serve as a basis for systematic social science research once Angolan independence is attained. Thus this is an important book, the best yet available to scholars and students who are interested in the continuing Angolan nationalist struggle. We are grateful to Marcum for his scholarly contribution and we look forward to the projected second volume.—RONALD H. CHILCOTE, *University of California, Riverside*.

Comparative Urban Research: The Administration and Politics of Cities. EDITED BY ROBERT T. DALAND. (Beverly Hills, California: Sage Publications, 1969. Pp. 368. \$10.00.)

It is the urban revolution to which we, after all, owe our civilization, and it is certainly to the culmination of that revolution, which is happening to us now, that we can ascribe most of our contemporary ills. And so it is to an understanding of that culminating process that had its beginning in prehistory (and is thus more than history; it may indeed be psychology or anthropology, though more aptly ecology) to which we must address ourselves. If we are to understand that culminating revolution, we must surely go beyond our provincial preoccupation with our own Western culture and norms, and seek generalizations and valid grounds for prediction in that world which used to be known as outside the bounds of Christendom, and which now is simply known as developing. To approach that developing world, however, one must have more than scientific curiosity and adequate methodological tools; one must have fortitude and courage for above and beyond the ordinary call of duty. One must indeed, to resort to the vernacular, have more brass than a government mule.

Professor Daland and his colleagues have all of these qualities in abundance. Their analytic approach and statistical examination of the data are as sophisticated as their material will allow, and yet, though I suspect them often of perfect, private certainty, they are not willing to visit upon

us their own inner perceptions of reality which we cannot possibly have, not having eaten with, drunk with, or gone to bed with the data. But they do not shrink from speculating about reality that cannot be empirically validated with the data at hand. Thus Miss Rabinovitz: "It seems intuitively that urban service levels are indicators of something other than the demographic level of urbanization. Could that something be the phenomena of 'urbanism' or the urban way of life?" If we are not ready to speculate intuitively, with Miss Rabinovitz, about what our data might show us at some time in the future, we shall surely be denied a scientific view of politics.

Much of this volume focuses on urban phenomena in the developing world. After an introductory essay by editor Robert T. Daland, which in itself constitutes a comprehensive statement of the problems as well as the goals of comparative urban research, Frank P. Sherwood looks theoretically at the position of the city as a subunit in the national system, and succinctly summarizes the possibilities for autonomous action by the local polity: "there is in fact a tremendous range of system-oriented behavior that occurs without reference to power and dominance"; and "power is highly variable. The addition of power at one level of the hierarchy does not at all mean the automatic withdrawal of power at another." Although Sherwood seems to be wanting to generalize for all time and every place, it is probably accurate to say that his principal points of reference are the American and Brazilian systems. Latin America at large, on the other hand, is the focus of Francine F. Rabinovitz; Malaysia of James F. Guyot; and two African cities of William John Hanna and Judith Lynne Hanna. Robert R. Alford, in a long concluding section, poses ways of viewing and interpreting the data shown from Latin America, Malaysia, and various African cities. Departing from this general pattern, Deil S. Wright and Daniel R. Grant examine American urban experience in separate essays on the city manager as development administrator and political access in the metropolitan governments of Nashville, Miami and Toronto.

Miss Rabinovitz, concerned with urban and political development in Latin America, uses her data well, while all the time admitting the uncertain nature of it. She is convincing, to my mind, when she argues that urbanization has affected economic development (there is a positive correlation between the two phenomena she insists), and that at the same time the city qua city affects little the politics of Latin America, except as a functioning subunit in a totally nation-centered political life. Equally dominated from the center are the urban villages being developed by the Federal Land Development Authority in Malaysia. This attempt to

urbanize a portion of the rural population, as described by James F. Guyot, is a center-dominated endeavor which could easily contain the seeds of its own destruction. Already there are signs of conflict between an elitist bureaucracy and the dominant political party, and this conflict may be a signal that cohesion could "dissolve into localism." Alford's criticism of Guyot—that he produces two possibly contradictory schemes of explanation—is valid, but he misses the point, I think, that Guyot is attempting to make, and that Sherwood in particular assumes: that urbanization may well develop a leadership cadre that is capable of challenging the center from a local base.

While not overlooking the relations of city to center in national political systems, the comparative focus of the Hannas is upon transnational differences and similarities found in two widely separated cities, Umuahia in eastern Nigeria (now Biafra), and Mbale in Uganda. The Hannas were able tentatively to conclude that similarities could be found in the politics of the two cities. For one thing, in both cities the role of the community influentials in integrating each system is partly a communications process (they "transmit the perspectives of one subunit's culture to another"), and partly a manipulative one (they "manipulate the practices and perspectives of one subunit so that they are more compatible with those of another"). For another thing, there seems to be a cosmopolitan orientation "on the part of members of the two communities' elites."

Oddly enough, the Hannas' research into the politics of Umuahia and Mbale, though carried out in a non-Western cultural environment, is conceptually closer to the investigations of Grant and Wright than to other essays in this collection. In using the non-Western world as its predominant focus, this volume puts a healthful emphasis on the role of cities in national systems, an emphasis that has been lacking in the study of American city politics and administration perhaps because of the smokescreen raised by the conceptually inadequate intergovernmental-relations approach. But is this focus too nation-centered? While exploring the importance of the relation of cities to national systems, the authors (except for Grant and the Hannas) tend largely to ignore the transnational character of larger cities (note the instances in which the metropolis physically spans national boundaries; note also that ecologically and organically there is a tendency for the city to become a *Weltstadt*, literally to reach out and encompass the world). Is it invalid to compare cities of 20,000 and 2,000,000 in the same national system, except as a means of understanding the particular national system? Does the city—at least the metropolis—so transcend the national system that comparative *urban* analysis (in contrast to *na-*

tional analysis) must emphasize the transnational over the national? To put the question another way, is the urbanist concerned primarily with the city qua city, or is his primary interest centered, to use that unfortunate coinage, in nation-building?

If the urbanist is interested primarily in the city qua city, then one of the opening statements by editor Daland very cogently identifies perhaps the only major difficulty with this otherwise excellent volume: "It has been noted that urban politics frequently varies more within nations than among categories of cities in different nations." This is a good working hypothesis, which I think most of us would perceive intuitively as valid. Acting upon this hypothesis, we would then divide this volume in two, and arrive at a more homogeneous mix in each one. In each case, the better mix would make a better book.—WILLIAM O. WINTER, *University of Colorado*.

Modernizing Peasant Societies: A Comparative Study in Asia and Africa. BY GUY HUNTER. (New York: Oxford University Press, 1969. Pp. 324. \$6.50.)

Perhaps the most common—yet the most irrelevant—argument in support of aid to the newly independent nations of Asia and Africa in the second decade after World War II was the success of the Marshall Plan in contributing to the economic revival of Europe in the first such decade. Programs, on the other hand, which did not implicitly confuse the preconditions of non-Western development with the quite different requirements of European reconstruction, tended, as in the case of President Truman's "Point Four" formulation, to invoke a strategy of assistance that would "greatly increase the industrial activity in other nations and [hence] raise substantially their standards of living." It is significant that the primary emphasis in *Modernizing Peasant Societies* is on the need for change in the agricultural sector as a precondition of economic advance for most countries of Asia and tropical Africa, and that the author makes only a half-dozen (almost cursory) references to the contribution that foreign aid, on a government-to-government basis, might be able to make to such a process. While the reader's immediate reaction is to regret that this volume was not available as "required reading" for developmental specialists in years past, it is perhaps only with benefit of hindsight that it can fully be appreciated as embodying the "common sense" of a highly complex matter.

The author states in his preface that the book is "the outcome of two and a half years' work on a project sponsored jointly by the Institute of Race Relations and the Overseas Development Institute (both in London)," the purpose of which was to inquire more deeply into the effect of 'the transfer

of institutions from developed to developing countries.'"

But as the work proceeded, it became increasingly clear that to concentrate wholly on 'transfer' did not provide an adequate basis for explanation of the problems and performance of developing countries. These problems arise . . . because developing countries are seeking rapid economic growth in a wholly different total environment from that in which the main thrust of growth took place in the West. They can neither recapitulate the sequences of growth in Europe between 1700 and 1900 nor take the full modern equipment of institutions and technology of the 20th century. Their paths of development must be, in many senses, unique. This constituted a challenge to adopt a wider framework which I was forced to accept.

Hunter's "wider framework" will disappoint those seeking a tightly-reasoned "theory of development." It yields instead a series of remarkably acute insights into the variety of factors influencing acceptance or rejection, success or failure, of change at the local level of peasant society. While the policy planner will lament the dearth of sweeping prescriptions, the thoughtful Peace Corps returnee will nod in agreement at virtually every page. Consider, for example, the simple matter of the introduction of fertilizer: "surely this is not surrounded by a host of complications and consequences? Yet indeed it is" (p. 115). And Hunter proceeds to tell us why. Or the fact that

there is a great temptation to jump the steps from hand-cultivation to tractor, because it seems uneconomic to have both forms of capital—animals and machines—when farming capital is so short (p. 117).

followed by a discussion of the varied consequences of the substitution of the machine for the animal, some of which may be distinctly counter-productive in developmental terms.

It should not be assumed from the foregoing that Hunter is either pessimistic regarding the potential for change in peasant society or skeptical as to the possible contribution of Western technology. He argues, rather, for *measured* change as dictated by a capacity for acceptance at the local level, rather than for change arbitrarily imposed by central government fiat. As Hunter himself succinctly puts it, the most fruitful approach, in many cases, may well be "the marriage of 17th century scale with 20th century technology" (p. 271). And insofar as central planning is concerned, he quotes with approval, Hans Singer's observation that "a plan must start from resources rather than needs" (p. 274). His definition of modernization is keyed to both notions:

Modernization can in fact only mean following a path which is possible for each nation in its current circumstances, using to best advantage the common stock of scientific knowledge which is available simultaneously to every country in the world (p. 296).

Arguing that "a second-rate engineer has at

least some skills to give to society [while] a second-rate Arts graduate has very few indeed," Hunter's treatment of the role of education as a modernizing influence is in full accord with that of other developmental analysts, save, perhaps, for specific emphasis, in keeping with the overall thrust of the book itself, on the need for "qualitative improvement of Primary schools in their full capacity as socializing agents . . . and available not in the city but in the rural areas" (p. 253).

Equally central to the books thrust is the argument that developmental financing for most Asian and African nations must, in the main, be internally generated, with the primary contribution, for the foreseeable future, stemming from the rural sector. There are many, however, who would challenge the author's optimism that agricultural productivity will sufficiently outstrip population growth for the remainder of the century as to make this possible.

The sub-title of *Modernizing Peasant Societies* is somewhat misleading. The book is by no means a rigorous comparative analysis, but rather the distillation of a large number of case studies coupled with the author's extensive field observations in both Asia and Africa. As such, however, it is a well-integrated and uniquely informative effort.—ARTHUR S. BANKS, *State University of New York at Binghamton*.

Les Groupes Communistes Aux Assemblées Parlementaires Italiennes (1958-1963) Et Françaises (1962-1967). By PIERRE FERRARI AND HERBERT MAISL. (Paris: Presses Universitaires De France, 1969. Pp. 214. 20F.)

In this interesting and valuable study of the Communist parliamentary groups in the lower houses of the French and Italian parliaments, Maisl and Ferrari have treated the two Communist groups separately in a work that really comprises two distinct monographs in juxtaposition. However, we gather from Duverger's remarks in the preface, as well as from the content of the work itself, that the authors compared notes at the outset regarding their respective plans of attack and also engaged in frequent consultation from time to time in the course of their research. There is, therefore, considerable similarity between the approaches employed by the two authors.

Although the French and Italian Communist parties are fairly similar in their electoral strength, there were some sharp differences between the two parliamentary groups under investigation, with regard to such questions as relative parliamentary strength and legislative role. After all, the Italian Communists entered the 1958-63 Chamber of Deputies with 140 out of 596 seats, whereas the French Communists had only 41 out of 482 seats in the National Assembly during the 1962-67 pe-

riod. The Italian Communists, as the second largest group in their chamber, had far more influence and leverage than did their French counterparts. Moreover, they confronted a shaky center coalition cabinet, whereas the French Communist Party was faced in 1962-67 by a strong Gaullist party with largely subservient allies—a party which, thanks to its virtual majority in the National Assembly and to a constitution which protected the executive branch against legislative recalcitrance, could afford to treat Parliament with some disdain.

Both authors begin by examining the official attitudes of the respective Communist parties with regard to the other parties in the system and to the parliamentary regime itself. They then proceed to analyze briefly the nominating process in the two parties in France and Italy, the campaign programs and techniques, and the social and occupational composition of the two parliamentary groups. The internal organization of both parliamentary groups is outlined in some detail; and the external relations of the groups are also given some attention, with Ferrari placing more emphasis on the relationship between the Italian Communist Party and various political forces outside of Parliament (such as pressure groups, local governments, etc.), whereas Maisl tends to dwell to a greater degree on the relations between French Communist Deputies and their parliamentary colleagues. In both countries there are close ties between the Communist party in Parliament and the extra-parliamentary party organization, with a considerable over-lapping of membership. And in Italy, of course, there was until recently a tendency for Communists and Socialists to collaborate closely on policy issues. The Ferrari study reveals that traces of this collaboration were still present in the 1958-63 Parliament.

Finally—and this is the core of the research—there are detailed statistical analyses of Communist participation in the work of the two chambers. The analyses cover private-member bills, private-member amendments to government bills, participation in debates, and questions addressed to the ministers. It becomes evident, as a result of these studies, that the Communist role in the French and Italian parliaments is by no means as important as one might superficially assume. Communist proposals are occasionally adopted by passing private-member bills or, more frequently, by passing private-member amendments to government bills. And Communist criticisms occasionally compel the government to modify its course somewhat. This is more often true in Italy than in France; for the Italian Communist Deputies are far more numerous and have enough votes to prevent Italian parliamentary standing committees from exercising their peculiar power to pass

laws in *sede deliberante*. In short, the Communist role cannot be cavalierly dismissed as being mere *a priori* anti-system opposition. For in both countries the Communist groups have made numerous constructive proposals, and have generally tried to project a moderate and democratic image.

The methods employed in the study are dictated to some degree by the nature of the phenomena under investigation. For instance, the analysis of roll-call votes would have been of limited usefulness in dealing with a party whose members invariably vote as a solid bloc in Parliament. Or, to cite another difficulty, the submission of a structured questionnaire to Communist Deputies might have aroused much suspicion in a highly centralized and disciplined party. And it is questionable, in any event, how willing busy national legislators would be to participate in such a time-consuming venture. For this reason perhaps, the authors have had to forego the more sophisticated findings which an opinion survey might have gleaned regarding the recruitment experiences and role perceptions of Communist Deputies. It might have been even more worthwhile to inquire as to how non-Communist Deputies perceive the role and effectiveness of the Communist parliamentary groups. But here again, of course, certain techniques might be rendered ineffective by lack of cooperation on the part of the politicians under scrutiny. It is interesting to note, in this regard, that Italian Communist Deputies appeared to be much more willing to grant informal interviews than were their French fellow-partisans.

In concluding, one must confess to a certain disappointment at the authors' failure to include a final chapter synthesizing their findings, comparing the behavior of the two Communist parliamentary groups, and suggesting certain hypotheses to be derived from their data. As it stands, their work contains much valuable material and many interesting insights; but one might have wished for a more truly *comparative* effort. However, first-class descriptive analyses and experiments with behavioral techniques are not so embarrassingly abundant in the field of Western European politics as to justify us in "crying over fat broth."—RAPHAEL ZARISKI, *University of Nebraska*.

The Power of Parliament. By RONALD BUTT. (New York: Walker and Company, 1968. Pp. 446. \$3.50.)

From time to time it is valuable to examine phenomena from a different perspective in order to question the conclusions of a currently accepted perspective. This is what the British journalist and scholar, Ronald Butt, has attempted to do in his book, *The Power of Parliament*. Butt's purpose is to show that the concern of parliamentary critics about the decline of the British Parliament is in a

number of respects exaggerated. In the first place, many of the Parliament's critics explicitly or implicitly compare the influence of backbench MPs today to their influence in the mid-19th century, as if this period was both typical and desirable. Secondly, most critics contend that the impact of Government backbenchers and the Opposition on legislation today has practically disappeared, whereas Butt finds that this is not the case.

After conveying these purposes in his introduction, Butt enters into an examination of the functions of Parliament as they developed to 1945. This examination leads him to conclude that the influence of mid-19th century Parliament was both highly exceptional in its degree and undesirable in its effects. Whereas during the mid-19th century the Private Member unceasingly made and unmade governments, Butt contends that neither before nor after this short period did parliamentary predominance prevail. Instead, the function of Parliament has typically been to support government by an executive, whose broad policies it approved. Butt also produces evidence to indicate that the unusual influence of mid-19th century Parliaments was not thought to be desirable. "It seemed at the time an irresponsibility, which was the despair, not the pride of contemporaries" (p. 408).

Butt does not pretend to discover much about the pre-1945 period which historians had not already uncovered. His conclusions gain their thrust in part because they are set along side contemporary criticisms of the decline of parliamentary influence. Moreover, he complements his historical examination with an original analysis of the role played by Government backbenchers and the Opposition since 1945. This analysis is intended to demonstrate that the influence of backbenchers and the Opposition on Governmental policy and the public is not substantially different today from the influence Parliament has traditionally exerted.

Butt repeatedly points out that the influence of the contemporary Parliament remains within the traditional parameters of maintaining executive government. Within these limits, however, Government backbenchers and the Opposition still exercise effective influence and he forwards numerous instances to support this contention. Over twenty examples of backbench influence on Government policy are presented. His case study of Resale Price Maintenance, for instance, shows that the Conservative Government did not introduce legislation to abolish R.P.M. for almost a decade in part because of its anticipation of the reaction of a sizable section of its backbenchers. When the Government finally did introduce legislation in 1964, it did so in part because of pressure forthcoming from others among its backbenchers. Or, to select another example, Butt contends that

the reservations Macmillan was required to put on the British application for membership in the Common Market in order to avoid widespread backbench rebellion (as well as interest group disaffection) were sufficiently fundamental so as eventually to lead to the French veto. Butt also shows that even when Government backbenchers were unsuccessful in their efforts to influence legislation, their revolts often ended at least in focusing public attention on the issue.

The contemporary influence of the Opposition on Government policies was also shown to have been effective in several cases, especially those in which a group of Government backbenchers was aligned with the Opposition. The Government's Common Market policy can again serve as an illustration. Macmillan's compromises were in part induced by the opposition of the PLP to Common Market membership. The impact on the public of attacks made in the Commons by the Opposition was also in evidence in a number of cases such as Suez and the Rents Act. Butt is careful to stress, as well, that the Opposition still controls approximately 30 percent of all parliamentary time.

Butt's emphasis on the influence that Government backbenchers and the Opposition can and do have both on Governmental policy and the public makes a substantial contribution to the literature on the House of Commons. Few will be able to look upon backbenchers as nothing but "lobby fodder" or as totally ineffective actors after reading this book.

It is true that Butt leaves a number of questions unanswered. For example, how often are efforts made to influence policy? One suspects the possibility that Government backbenchers (whose action is usually a necessary condition for influencing the Government), while making more successful attempts to influence the Government than the previous literature anticipated, do not make nearly the number of attempts that backbenchers did in earlier Parliaments or that governmental legislators do in other systems. Answers to questions such as this one would have considerable bearing on Butt's conclusions and deserve additional research. The significance of Butt's contribution is that he presents a case which advances knowledge sufficiently beyond that provided by the critics so as to be suitable as a focus for new discussion and research on the House of Commons.—JOHN E. SCHWARZ, *University of Minnesota*.

An Ideology in Power: Reflections on the Russian Revolution. BY BERTRAM D. WOLFE. (New York, Stein and Day, 1969. Pp. 394. \$10.00.)

At first glance this book appears to be a "scissors and paste" job. It is a collection of miscellaneous articles and addresses composed by the au-

thor from the early forties to the present. Only one chapter, "The Forced Labor Reform after Stalin's Death," seems not to have been published previously. The subject matter of these chapters is extremely diverse, covering such topics as: "Marxism and the Russian Revolution," "Backwardness and Industrialization in Russian History and Thought," and chapters on Lenin as a totalitarian, succession struggles, the secret police, Soviet elections, Soviet histories, Soviet science and culture, ideology, and foreign policy, and a final chapter on the theory of convergence.

Nevertheless, the book does form a coherent whole; there is unity in diversity. As Dr. Leonard Shapiro says in the Foreword, "... it becomes a kind of hand-book of totalitarian behavior in its various aspects, both internal and external." (p. VIII). Let us try to paraphrase the underlying unity of Dr. Wolfe's study.

First, take the chapter, "The Durability of Despotism in the Soviet System," which the author states is probably the most frequently anthologized of his essays. Here he makes a distinction between "changes so clearly of a secondary order that they may be designated *within-system changes* and those so clearly fundamental that they involve *changes in the system* or basic societal structure." (pp. 181-2). He characterizes modern totalitarianism as a society "calculated to assimilate the changes which it intends and those which are forced upon it, in such fashion that—barring explosion from within or battering down from without—the changes tend to be either inhibited or shaped and assimilated as within-system changes in a *persistent system with built-in staying powers*." (p. 185. My italics). Thus does Dr. Wolfe stress the durability of despotic systems.

Furthermore, the author does not see collective leadership as either a permanent change in the nature of the system or as a basic change involving dispersal of power. It is essentially transitional, because there is no legitimacy to provide a successor. There are no "*socially organized checks*" to restrain the flow of power to the top. A crisis of succession is almost guaranteed until the rise of a new dictator (Brezhnev and/or Kosygin and/or somebody else, watch out!):

"The whole dynamics of dictatorship calls for a personal dictator; authoritarianism for an authority; infallible doctrine for an infallible applier and interpreter; totally militarized life for a supreme commander; centralized, undivided, all-embracing, and 'messianic' power for a 'charismatic' symbol and tenant of authority." (p. 191).

Other "changes" since the death of Stalin that other writers have pointed to include the elimination of purges and relaxation of terror, law reform, and a "thaw" in the arts. Again, none of these are really basic.

Dr. Wolfe points out that the blood purge has not been forgotten, but is being held in reserve. He points to the facts that in preparation for the Twentieth Congress all the regional secretaries and leading committees were renewed; thirty-seven per cent of those present at the Nineteenth Congress disappeared, and forty-four per cent of the Central Committee failed to be elected as delegates. Also he recalls the execution of Beria and about twenty-five of his friends. It is true that terror in society as a whole has been diminished, but one reason for this is the now more deeply ingrained habit of obedience. Another is that concentration camps are a wasteful method of production. The camps are gentler now, yet they are there. Consider constant references in the Soviet press to people being "dispatched" or "allocated" to this or that construction project or industrial enterprise. The situation today has been referred to as one of "terror on ice."

The discussion on the codification and regularization of the laws Dr. Wolfe dismisses as "much fuss." He points out that in fact public prosecutors have been given much more control of trials and pre-trial inquisitions. Harold J. Berman, who does see some trends toward liberalization, nevertheless has pointed out that in 1961 and 1962 there was a return of harsher criminal and administrative penalties. In at least one case the death penalty was applied retroactively, and in this period he estimates that probably over 250 Soviet citizens were executed for economic and other crimes. (In 1961 forty-three persons were executed in the United States.)

As for "thaw" in literature and the arts one can easily perceive Dr. Wolfe's reaction to such incidents as the Pasternak affair, the imprisonment of Daniel and Sinyavsky along with others, the defection of Anatoly Kuznetsov, and the current agony to which Alexander Solzhenitzyn is being subjected.

This image of a state still basically totalitarian brings us to the theory of convergence, popular in some quarters, but hotly disputed in others—among them Dr. Wolfe. He attacks the arguments of John Kenneth Galbraith, James Burnham, Pitirim Sorokin, and others that, as the USSR approaches the USA as a "mature" industrial society, and managers, engineers, and technologists gain increasing influence, then the differences in the two societies will have become minor and may be ignored. Essentially this "simplification" borrows from the Marxist concept that economics determines politics and culture. As an ally in refuting this Dr. Wolfe calls on—Karl Marx! Although Marx himself was a "terrible simplifier," further study taught him that he had learned more than the content of the product he was trying to sell. He knew that the history of peoples was infinitely

more complicated than the simple formulae of "economic determinism" and "inevitable social progression." Hence many of his writings purposely left unpublished and appeared only after his death. For the same reason *Das Kapital* was never finished and remained a "torso." Technology like money is neutral. As Germany reached England's level of economic development between 1870 and 1914, for example, the two countries became less like each other politically, culturally, and institutionally. Beyond technology—the Russian heritage is very different from the American heritage.

Dr. Wolfe shows a keen appreciation of history, as chapters on Tsardom, World War I, and Poland testify. His reputation and credentials are well known. His prognosis is gloomy. (I am sure he wishes it could be otherwise.) It seems to this reviewer to be realistic and arrived at in a scholarly manner—years of study in the field and first-hand acquaintance with many of the major actors. He staunchly stands up to his critics, and his case is well made. If the patient is unhealthy, it is no use to say he is well because you want him to be. Dr. Wolfe's erudite and well-balanced observations can be of great benefit to Western students of the Soviet Union.—BENJAMIN M. MAY, JR., *Lafayette College*.

Fiji Goes to the Polls. BY NORMAN MELLER AND JAMES ANTHONY. (Honolulu: East-West Center Press, 1969. Pp. 184, \$5.50.)

The South Pacific remains the last major area of European colonialism, with the bulk of its people still living under British, French, American, Australian or New Zealand rule. But even there modern democratic institutions are being adopted whether the outcome is independence as in Western Samoa, autonomy as in the Cook Islands, or colonially controlled internal self-government as in New Guinea and Fiji. Professor Meller's book reminds us how slowly and cautiously the British have been moving in their largest remaining Pacific dependency, Fiji. He describes the 1963 Fiji Legislative Council elections, with a postscript bringing the story up to date. In 1963 Fiji still had the classic Crown Colony political structure abandoned in Ceylon as long ago as 1931. In 1963 it elected unofficial members to its Legislative Council in the first election in which the Fijians had been asked to vote by modern methods rather than be represented through their chiefs. Even so, the vote was granted only on the basis of literacy while candidates had to possess fairly high property qualifications. It was only a year later that the illiterate and virtually propertyless natives of Australian New Guinea voted for their own Legislative Council by universal suffrage.

The caution with which Fiji moved towards uni-

versal suffrage epitomizes the British colonial attitude. It is a pity that the authors have made very few comparative references. For the devices of literacy qualification and communal representation used in Fiji in 1963 had been tried out elsewhere in the British Empire over the preceding years. In all cases these conservative measures had to be abandoned under popular pressure. As the postscript reveals the same fate befell the Fijian system only two years after its introduction. While the main argument used for caution in Fiji has always been that the British had a contractual obligation to protect the rights of the indigenous Fijians, a comparative analysis might have suggested that the devices used in 1963 were by no means peculiar to the local situation.

While this book is a very valuable addition to the comparative study of elections it suffers by comparison, for example with Professor Colin Hughes' study of the New Guinea elections of 1964 and even with the much older *Five Elections in Africa* edited by Professors MacKenzie and Robinson as long ago as 1960. In part this is because the book is too short, in part because the authors did not actually witness the election and in part because it lacks the historical dimension which a comparison with the post-1963 situation might have given it. Unfortunately for the authors the entire basis of election was changed almost immediately. They might have been better advised to have contrasted the 1963 and 1966 situations, rather than simply adding their "Postscript."

The shortness of the book has meant that much of the fascinating detail of electioneering is overlooked. The candidates all appear as shadowy figures with no reality. As there were only thirty of them the reader at least deserves more detail than is given in Chapter Four—"Profile of the Candidates." We learn very little about any of them except that nearly all of them were lawyers or professional men, which is hardly surprising in view of the property and literacy qualifications, in particular the stipulation that candidates must be able to speak and read English. One also misses an account of the social forces at work. The authors note that the Indians returned were all from minority communities, but tell us nothing about the operation of caste, language or ethnic groupings amongst the Indian voters. Are these less important than in India itself? We do get a fleeting picture of the clash between traditional and modern deference patterns among the Fijians but it is scarcely full enough. The pressure groups and economic interests concerned with Fiji politics are scarcely mentioned. Most markedly the Colonial Sugar Refining Co. is only mentioned in a footnote. Are they not interested in what happens to one of their most profitable properties?

Had the 1963 and 1966 situations been compared

then much more would have been said about parties. The 1963 election appears to have been fought largely between individuals. Yet three years later there were flourishing and well organised parties, stemming partly from the already existing trade union movement. The authors seem to lend support to the British Conservative politician Nigel Fisher's rather old remark that "parties in Fiji will be racial if true political parties are not developed." What makes a party "true" rather than false is not stated. The authors seem to feel that only cross-ethnic parties on a policy basis are really parties. Yet the record of many underdeveloped countries suggests that parties are very often on an ethnic base and quite reasonably so, where, as in Fiji, the interest of one ethnic group is deliberately preserved against the interest of the other (which happens also to be the numerical majority). This was the case in the very similar situation of now independent Mauritius where the warring communal parties have developed, not as "true" parties, but as coalition partners in a dominant-party system.

Although Fiji moved much more rapidly towards self-government under the newly elected British Labour government it is still dependent and still faced with the sort of dilemma which the British have found almost unanswerable in other territories. It is—shall the numerically dominant and politically aware Indian community be allowed to capture power through the ballot box or will it be crushed between the dominant European business interests and their allies the conservative Fijian landowners? *Fiji Goes to the Polls* while an interesting and worthwhile study cannot, within its narrow scope, give us more than an inkling of the possible outcome.—JAMES JUPP, *University of York, England*.

Léopold Sédar Senghor and the Politics of Negritude. BY IRVING LEONARD MARKOVITZ. (New York: Atheneum, 1969. Pp. 300. \$10.00.)

Professor Markovitz's book is a very valuable contribution to the already existing literature on Negritude. Considering the attacks on the concept of Negritude during last summer's symposium on African culture held concurrently with the First Festival of Pan African Culture in Algeria (*West Africa*, August 9, 1969; pp. 913-914), Professor Markovitz could have picked no better time to publish the book.

The Politics of Negritude, though focused primarily on Senegal, deals with the crucial problem confronting African states as they undertake the task of nation building—how to translate abstract ideas into pragmatic actions. The concept of Negritude which provided a sort of myth or an ideological foundation for the pre-independence African cultural and political nationalism is presently

losing its initial appeal. Senghor, one of its chief advocates, has modified his ideas "from the kind of abstraction which appealed to a humanistically educated intelligentsia to a new pragmatic reliance on science and technology" (p. 35).

Professor Markovitz treats Senghor's concept of Negritude under three periods—the pre-second world war, the post-second world war till independence and the post-independence. The first period witnessed the emergence of Negritude in France among the *évolués noirs* who, in anticipation of better economic and social status, had alienated themselves from their indigenous culture in favor of European culture. They realized that they were "caught between [two] cultures, and belong wholly to neither" (p. 46). Frustrated by alienation, prejudice and loss of dignity, they started a quest for the "holy grail," their "collective soul." Professor Markovitz describes Negritude at this stage as a protest ideology which "served the psychological needs of [black] intellectuals in the Paris . . ." (p. 28).

At the second period, Negritude is presented as an ideology designed to facilitate "dialogue and accommodation with the colonial power" (p. 61). Its advocates emphasized those elements which "bound together France and Africa" (p. 61). Professor Markovitz notes the functional change of Negritude at this period. "From a basic weapon of conflict, the radical aspects of Negritude had evolved into a theory of synthesis and unity" (p. 61).

Two main aspects of Senghor's thought are emphasized at the third period of Negritude. One of them is the concept of the "Civilization of the Universal." Here Senghor advocates a sort of Utopia based on the synthesis of unique elements of various civilizations. Professor Markovitz, like many critics of Senghor, tends to emphasize only the international ramifications of the idea, thus ignoring its possible contribution to the problem of nation building in Senegal and other African states. The idea of the "Civilization of the Universal," if properly directed and structured on the national level, could well be the answer to the problem of national unity presently confronting the African states. The existing ethnic and linguistic groups, or what Senghor describes as the "fatherlands" could become the units for the nation-states or "communities." Broadening the areas of shared interests among the "fatherlands" to the extent that each has to relate its own actions to those of others as well as regard the actions of others as giving point and direction to its own, could promote a sense of interdependence and unity as well as instill democratic attitudes.

Professor Markovitz tends to view the formation of "class cleavages" as the panacea to the problem of national unity because "class cleavages

can override other parochial loyalties . . ." (p. 149). Although this observation is plausible, it tends to be the least realistic to African experience when the following points are taken into consideration. First, considering the experience of the Western states, the formation of "class cleavages" based on economic interests out of the present poor economic situations in the African states, would take a long time, and could not, therefore, provide an immediate answer to the pressing problem of national consciousness and unity.

Secondly, even if it were possible to form "class cleavages" within a reasonable time, the experiences of the African states, have shown that the African bourgeoisie, irrespective of their class interests, tend to remain loyal to their ethnic and linguistic groups. Thus, despite "class cleavages" loyalty to "fatherlands" could still exist. Finally, since ethnic consciousness is an established fact in the African states, an attempt to ignore it by simply superimposing class systems could exacerbate further problems. A system which first recognizes the interests of the existing groups and then broadens these interests into national perspective is most likely to provide the most practical solution to the problem of national unity.—MOSES AKPAN, *Southern University*.

The Police and Political Development in India. By DAVID H. BAYLEY. (Princeton: Princeton University Press, 1969. Pp. 482. \$15.00.)

This book reports the analysis of an intensive study of civilian-police relationships in India as they affect both the efficiency of the Indian police and the development of a democratic polity. The data analyzed are of two types. First, aggregate statistics of crime and police effectiveness are presented with a detailed discussion of police organization. Second, a very ambitious survey research project was carried out on thirty-six hundred Indian respondents. Included in the sample are urban-rural, north-south, and student-non-student sub-samples. The data are presented clearly and with relevance to the points made in the text. Statistical analysis of the survey data included correlational analysis, factor analysis of selected variables, and chi-square and t-tests for differences between samples on parametric and dichotomous variables. The author has excellent sense in his choice of statistical applications. For these reasons alone, the book represents a significant improvement in the use of sophisticated research methodologies in political research in India.

The value of the book for scholars interested in political development from different perspectives hinges on the validity of the author's major premise, which is that favorable public attitudes toward the police are conducive to a higher order of political development. Unfortunately the relationship

between police and public on the one hand, and the prerequisites for a "developed" system are not clearly stated. Bayley does not define what he means by political development. One interpolates from his discussion, however, that he is concerned with the effect of police behavior on the development of a stable democratic political order. The purpose of the book, then, is to analyze data which would and does result in a series of recommendations which would improve police-citizen relationships. The assumption is that such an improvement will also benefit the democratic political order.

To evaluate the effectiveness of the Indian police, Bayley directs his research in answer to a set of questions about what, how, and under what conditions the Indian police affect political life. In answer to these questions, Bayley suggests that police forces everywhere perform the following activities: maintenance of law and order, establishment of the boundaries of permissible political action, regulation of mobility and economic patterns through administration, and determination of the scope of police law and order activities. Related to these functions or activities are "styles" of performance. Police may be passive or active in their concern with crime prevention. They may be secret or open in their dealings with the public and other structures of government. They may be rude and insensitive or polite and informal, and partial or impartial in handling cases. All of these patterns affect the public perception of the police. Their corporate image in the eyes of the public may be an example of an integrated, national organization. They may, according to Bayley, "serve a symbolic role, representing a nation yet to be, developing national heroes, and giving a sense of pride in country by means of parades, reviews, and athletic competitions." Finally, the police through organization and socialization patterns mold future policemen to appropriate roles of the police in a society. The police, like the military, may become either an avenue for social mobility, or an important basis of political power.

From this basic model, obviously over-simplified from Bayley's discussion, we turn to his findings. The first part of the book is based upon an analysis of police organization and how well they perform their missions of crime control and the control of massive civil disorder. From this analysis, Bayley concludes that given their resources, the rigidity of the personnel advancement system, the rather low ratio of police to citizens, and the poor pay and education of the lower constabulary ranks, the Indian police are a remarkably effective organization.

Turning to citizen attitudes and perceptions of the Indian police, Bayley's survey research data points to low regard for the police by Indian citi-

zens. Related to low regard is real doubt about the sincerity, probity, and motivation of the Indian police. Public hostility towards the police is reciprocated by the police in their own attitudes towards the public. Police complain that people protect criminals, lie when giving testimony, and generally obstruct police work.

For Bayley, the consequences of this mutually hostile set of perceptions is to lower the quality of law enforcement, weaken the general capacity of government to gain diffuse support and compliance, and, perhaps, to erode citizen acceptance of democratic values and institutions.

Thus we have two potentially contradictory conclusions. An effective police force operates in an environment that is passive at best, hostile and uncooperative at worst. The liberal assumptions behind the analysis are that the democracy is better served if the public has active and positive orientations toward the police, and this end would be achieved by improving the "cutting edge" of police-public relationships, the constabulary. These conclusions raise at least four critical questions for this reviewer. First, might there be a positive relationship between police effectiveness and public hostility? Second, might public hostility toward police be a kind of check serving to maximize individual freedom by limiting police activity? Third, is it not possible that the Indian reluctance to involve the police in conflict situations is in part a consequence of other conflict-resolution mechanisms in the society? Fourth, are the problems which India has with the police so serious that their solution should demand a higher share of public resources than they now receive? The real problem for those who would like to see police reform in India is that the system as presently constituted works surprisingly well.—RICHARD N. BLUE, *University of Minnesota*.

The Politics of Defection: A Study of State Politics in India. BY SUBHASH C. KASHYAP. (New Delhi: National Publishing House, 1969. Pp. 442. \$11.25.)

Shri Kashyap has attempted to study the politics of defection in seven Indian states: Rajasthan, Haryana, Uttar Pradesh, Bihar, Punjab, Madhya Pradesh and West Bengal. His major thesis is that political defection of state legislators in India has not resulted in political polarization. While admitting the impreciseness of the term "defection" and without a defensible analysis of the concept, the major portion of this volume is devoted to a chronological summary of the defection of state legislators and the breakdown of legislative government in the states. The results of this analysis is a detailed step by step description of each state government crisis. The reader may well become confused by the myriad defections

and counter-defections he encounters. It becomes apparent that the immediate causes and consequences of defection vary from state to state.

In Rajasthan the cause of defection was the ambitions of legislators for a portfolio in the state government while the Congress party required their limited participation in order to achieve a slender majority necessary to form the Government. In Haryana, by contrast, where the Congress had a comfortable majority after the Fourth General Election, it lost the control of the government under the pressure of the age-old caste rivalries as well as the drive of individual politicians for power. While Rajasthan defectors were rewarded, by contrast Haryana defectors were severely punished by being deprived a place on the election rolls. In UP Congress formed its legislative majority by rewarding defectors who joined, only to have the rivalry of Congress leaders destroy their slender majority. Shri Charan Singh, a Congress leader, defected with his faction to join with opposition leaders to form a coalition government with its consequent instability leading to Presidential Rule. In Bihar, instability of coalition state government was characteristic after twenty years of unchallenged Congress control. Defection and re-defection were rampant, running as high as four times. Once again the result was Presidential Rule. A somewhat similar pattern existed in the Punjab where Congress coalition with the opposition toppled the coalition government with resultant instability and threats of Presidential Rule. By contrast in Madhya Pradesh a faction ridden Congress party could not form a stable coalition with opposition political parties to constitute a majority sufficient to form a state government. In West Bengal, Congress defectors joined with other groups to form an unstable coalition government which ultimately led to Presidential Rule.

The price for such instability is too obvious to catalogue. Shri Kashyap's solutions are not defensible in light of the twenty years of relatively successful experience with western model democratic government. While he believes that it "seems most advisable to look forward to and work for the emergence of programme-oriented parties and a two-party system based on a broad national consensus," he simultaneously believes "it may be ideal to grant a holiday to party politics." For him the issue is whether India is irrevocably committed to accepting western political models or whether "we would like to build our polity on the basis of our own genius and social ethos." His conclusion in support of Shri Jaya Prakash Narayan's "partyless democracy" is based upon the ideal of cooperation and harmony for the general good.

The Politics of Defection which has provided the details of defection and counter-defection,

ends in a trial of confusion. For the modern political scientist it has left unanswered such basic inquiries: What variables move the legislator to defect and re-defect? What political models may be extrapolated from the chronology of events? How could such models aid in stabilizing Indian state governments in order to attack important Indian political problems? How can the models developed be used to stabilize caste and community rivalries in order to prevent governmental dislocation? What hypotheses may be developed explaining the absence of polarization amid rampant defection? What models of national party intervention or non-intervention into state legislative conflict resolution can be developed from the evidence assembled?

Answers to these significant questions could provide us with sound theoretical assumptions by which to evaluate similar movements occurring in other states, including Kerala. They would provide valuable insights in dealing with other politically developing institutions in Ceylon and Pakistan.

It is well to consider whether Shri Kashyap's suggestions for importing the partyless government system is defensible in light of the history of the Sarvodaya movement in India. Jayaprakash Narayan's experience with party politics in India left him convinced of the barrenness of the political arena and the need to develop a political structure which reflected indigenous Indian values rather than an adaptation of western political institutions and their inherent values. His withdrawal from party politics may alternatively be evaluated as the results of idealistic disillusionment or the tactics of a sulking Agamemnon awaiting the call to national leadership. Whichever interpretation may be preferable, partyless democracy in modern India is an idealized nostalgia for the mythical past age of tranquility which rarely, if ever, existed. Indian economic and political development has engrafted western models and has managed them with varying degrees of success. None of the evidence offered by Kashyap can possibly justify the relevance and operational capability of a partyless system to modern India.

There is one sense in which the concept has validity within the framework which the author presents. Accepting the provisional validity of his conclusion that no polarization is resulting from defections, and that candidates and the issues rather than the party, are increasingly significant, the thesis which needs testing is whether India is now approaching a phase in which all but the extreme left and right parties are recrystallizing and re-aligning with the resultant emergence of coalition or "national front" governments which tend to blur programmatic and policy differences. If partyless government then comes to India it may

be within the framework of the consensus of party of which Shri Kashyap speaks. One immediately then asks whether this is in fact only a variant of the multi-party (weak type) model of western Europe. Under such circumstance the era of partyless democracy would refer to "partyless" in the programmatic sense rather than the constitutional.

Shri Kashyap has by his presentation opened the door to many possibilities for research and analysis. In providing us with the chronology of events in seven critical areas he has performed a useful and needed service. He has also thoughtfully included an Appendix which includes texts of the important governmental proclamations and orders dealing with the crises studied. These texts are of great value to the student of Indian politics who would otherwise have difficulty of access to them.—BENJAMIN N. SCHOENFELD, *Temple University*.

The Arabs in Israel: A Political Study. By JOSEPH M. LANDAU. (New York: Oxford University Press, 1969. Pp. 300. \$9.95.)

It is almost too much to hope that so slim a volume as Jacob Landau's new study, *The Arabs in Israel*, could deal effectively with a topic so broad and controversial. Yet, Professor Landau, who is a Jewish scholar at the Hebrew University, is an unusually well-informed and perceptive authority on the domestic minority problems of the Israeli State. This is the first fairly objective and somewhat detailed study of the internal developments of the Arab community living as a minority in Israel (in 1966, Arabs made up 12 percent of the total Israeli population). This study is a highly sophisticated presentation representing a successful blending of accurate historical description, political insight and contemporary survey techniques. Landau's book, which includes an evenly balanced mixture of Hebrew, Arab and Western sources, should be a welcome addition to the bibliography of students in Middle Eastern Affairs. Although Professor Landau seeks with great determination to write objectively, fairly, and in an impeccably scholarly fashion about issues which all too often become shrouded in emotionalism, Arab writers and Pro-Arab scholars will find Landau's judgment on the assimilation policies of Israel controversial and somewhat sterile. The obvious divergence of interpretation of Arab conditions in Israel is singularly outlined in Landau's discussion on education. Arab writers have tended to chastise Israeli policy-makers for deliberately blocking attempts to increase the quality and quantity of education. Professor Landau argues that the State of Israel has "invested considerable effort in broadening and improving Arab education" and Israel, like the British before, have found this a formidable task. Recognizing the

problems of increasing educational opportunities, whether because of Israeli dereliction or Arab indolence, it must be admitted that Israel has little to gain from encouraging an educational experience which tends to broaden young minds to the world of conflicting nationalisms and competing ideologies.

One regrettable aspect of Professor Landau's book is his complete willingness to delineate the Arab grievances without fully probing the ramifications of these issues. Thus such problems as the military administration, discrimination, freedom of expression, expropriation of land, Arab education, and superior attitudes of some Jews are all properly listed, yet the analysis of these issues is, generally, limited to a paragraph or two.

While one may quarrel with the salient optimism of this study, and the tendency to white wash significant issues, few will fail to recognize that the number of questions raised, the complexity of the factors analyzed, the wealth of evidence adduced, and the astuteness of the hypotheses advanced are remarkable for a work of this size. In a study so rich and variegated, readers will probably differ as to what aspects are the most significant. Since the major emphasis of the book is on the political behavior of the Israeli Arabs, Professor Landau, in a series of chapters that cover two-thirds of the book, does seek to focus on: (1) the Arab minority's relations with Israeli parties and other political groups and organizations, (2) Arab participation in local, trade union and national Parliamentary election, and (3) The trends and pressures that presently influence Arab leadership patterns.

Several factors graphically analyzed by Professor Landau explain the present lot of the Israeli Arab minority. In 1948 the vast majority of those Arabs (some 160,000) who had not left Palestine (now Israel) were simple village peasants since most of the Arab leaders and intellectuals had departed prior to the 1947 Arab-Israeli War. Professor Landau carefully analyses the attempts by all Israeli political parties to control and monopolize this amorphous Arab vote. In a country where coalition government is the norm, extraneous minority groups can play a key role and all major parties have presented Arab lists which hopefully would attract Arab voters. In evaluating the dominant position of the Mapai Party (this major party in Israel has consistently obtained over fifty percent of the Arab voters), Professor Landau defines their strength among the Arab voters as largely a function of "opportunistic Arab notables" who, as their predecessors, have always cooperated with the occupying military forces, i.e., Ottoman, British and now Israeli. Far more significant as a harbinger of future political trends is the consistent ability of the Maqi (communist)

party to attract over 20 percent (except in 1959) of the Arab vote. The Israeli Communist Party has the obvious advantage of being the only Israeli party willing to repudiate Zionist aspirations. More recently the Communist Party has sought to identify with the more radical forms of Arab nationalism now supported by the Soviet Union. Supporting and encouraging every sign of dissatisfaction among the Arab youth, the Communist Party through a continuous barrage of propaganda, has presented itself as the natural ally of the young Israeli Arab who now seeks to break the influence of the traditional family (hamula) leaders.

While admitting that Landau's study does not include the dramatic shifts in Arab opinion since the June War, one has the feeling that Landau, in his desire to present a somewhat optimistic view of Arab-Israeli relations has actually failed to capture the egregious theme of the Zionist-Arab nationalist confrontation. One recurring *leitmotiv* acknowledged, but seldom pursued to its logical conclusion, is the inevitable and explosive conflict of Zionism and Arab nationalism which has produced not only violent outbreaks between Israel and the surrounding Arab states, but has also made smooth relations between Jews and Arabs inside Israel extremely volatile. It is this reviewer's guarded opinion that this endemic and infectious pattern of violent nationalism so prevalent among the young Arab intellectuals in Israel will recalcitrate against any majority-imposed form of "cooperation" and will, (unless present trends are reversed), eventually denote the total "bankruptcy" of the Israeli Arab-Zionist relations. —JAMES B. MAYFIELD, *The University of Utah*.

Chiefs, Council and Commissioner: Some Problems of Government in Rhodesia. By J. F. HOLLEMAN. (Assen, the Netherlands: Published on behalf of the Afrika-Studiecentrum by Royal VanGorcum Ltd., 1969. Pp. 391. Hfl. 29.)

Social anthropologist and urban administrative officer in Rhodesia (1945-1957), frequent visitor since then, and present Director of the Netherlands Universities' Afrika-Studiecentrum in Leiden, Professor Holleman has made a most valuable contribution to the understanding of the "Rhodesian situation" in its widest sense of black majority-white minority confrontation.

Core of the three-part work is the some 170-page case study of a chieftainship and its local Council based on the Report of the Mangwende Reserve Commission of Inquiry of 1961 of which the author was a member, preceded by a short account of the late nineteenth century British colonization of Rhodesia, and followed by an analysis of administrative and government policies leading up to the Rhodesian Unilateral Declaration of In-

dependence in November 1965. Thematically, the study is concerned with the confrontation between the "theoretically superior external control" (the Rhodesian white administration) and the "limited local autonomy" (the African chieftainships) in the midst of which stands the traditional chief with his conflicting loyalties to both.

The study sheds light on the role of the chief in the expansion of white domination from the initial so-called "Treaty of Friendship" of 1888 with the Matabela King Lobengula through the "unanimous support" from the tribal authorities for the government's efforts to achieve independence on the basis of the Constitution of 1961, that is, under a white government," some seventy-five years later. (p. 348) The analysis focuses on the interaction between opposing group interests and on the conflict of value systems which, though derived from different cultures (African and European), were forced together into a single socio-political context on the local level: the council. There the traditional African chief—supposed to be both tribal representative and administrative spokesman—finds that if he tries to initiate programs or reforms, new schools for example, he changes from the white commissioner's subordinate to a threat to the system. "Tragic" conflict replaces communication and cooperation between the two individuals.

This conflict on the local level is the reflection of the cleavage on the national level; the source of both is misunderstanding. "For a quarter century and more, the indigenous population had been subjected in progressive degrees to measures based upon the premises that a sound economic basis was essential for a stable society;" the white administration did not realize that "equal weight should be given to the premises that no sound economy could possibly exist on an unstable social foundation." (p. 212) For example, legislation involving sweeping changes in agriculture was promulgated and implemented on the basis of modern agronomical principles with little or no knowledge of or regard for customary land usage.

During the sixties administrative policies changed: Aimed at stimulating responsible African local self-government, the "new nonauthoritarian and non-paternalistic philosophy of 'community development' was being advanced as the unitary purpose to which all service departments should as far as possible direct their efforts." (p. 258) This meant changing fundamental attitudes, both of the civil servants and of the great majority of Africans who had "through force of historical circumstances and the lifelong habit of submitting to the superior power of white government, accepted white authoritarianism and paternalistic initiative as part of the established order of their existence." (p. 269) But political circum-

stances discouraged the working relationship between officialdom and the African public needed to adjust attitudes.

Professor Holleman points out that the new policy of community development was "the product of the *administrative* mind, conceived to be carried out as a measure of administrative practice not to be associated with the diverse currents of party-politics in the country." (p. 274) But it *did* become a political issue and was "naturally but unjustly . . . interpreted by white liberals and African nationalists as an insincere and poorly disguised plan to arrest further racial integration and to reinforce the existing segregation . . . by stimulating a process of *separate* development." (p. 276)

The same political pressure led the white government to "rediscover" the chiefs and by recasting them from a subordinate position in the administrative hierarchy into a nationally organized political force to enlist their aid against the common enemy, the African nationalist. Evidence of the cooperation were a conference of some 500 chiefs with government representatives in 1961 and another of some 600 tribal chiefs and headmen in 1964. From the latter emerged their unanimous support (Holleman's explanation of the meaning of traditional unanimity (p. 349) sheds an interesting light on Africa's one-party states.) of the government's proposals; this decision of the chiefs, claims Holleman, "was a major factor which contributed to the government's decision, a year later, to drive the principal issue between London and Salisbury beyond the point of no return with its unilateral declaration of Rhodesia's independence." (p. 356) After U.D.I and by mid-1968 it seemed that "Government's policy would be to increase the power of the tribal authorities sufficiently to strengthen its own powers of control over the majority of black citizens" (p. 362)

The author has "deliberately tried to avoid passing judgement or expressing outright condemnation" of conflicting views about present-day Rhodesia. (p. xvi) The book is not and most explicitly is not intended to be an analysis of the problem of the Rhodesian declaration of independence, nor of the black-white confrontation in its entirety. These topics are touched upon to the extent that they are relevant to the central theme of the book: the changing and conflicting roles of the traditional chiefs.

As a sociologist and a scientist Holleman concentrates on the *sociological* reality of confrontation between two cultures (races), and in this capacity he foresees the possibilities of accommodation between the two. At fault has been insufficient understanding between blacks and whites due in part to an administration that just "disseminated instructions" instead of communicating. As a study of conflict between two cultures

the book's relevance is wider than the context in which the study was carried out. But, within the context of the Rhodesian situation—the *political* reality of minority rule which is unacceptable to the African nationalists—the work might be judged by them to be irrelevant.

This book is written by an involved and concerned individual, a fact which bears not so much on his objectivity, as he himself fears (p. xxi), as on his venturing into sidetracks which a personally detached reader (a political scientist interested in political development in general) may not find absolutely necessary. With this minor reservation, I highly recommend the book not only to specialists on Rhodesia but to social scientists studying community development and the intricacies of local government in developing countries.—DOV RONEN, *Purdue University*.

Military and Politics in Israel: Nation-Building and Role Expansion. By AMOS PERLMUTTER. (New York: Frederick A. Praeger, 1969. Pp. 161. \$6.50.)

The proliferation of military regimes in the Third World and growing concern regarding the strength and influence of military establishments elsewhere have spawned a significant increase in the number of studies of the role of the military in domestic politics. The socio-economic tensions and fissures that precipitate the demise of civilian authority, and the political context that propels military elites into the center of the political arena are endemic in many parts of the world. With the apparent trend toward greater politicization and political involvement on the part of military structures, it would be safe to assume that there will be increasing attention in the discipline to conditions favoring or inhibiting such developments. As comparative research accumulates (and it is a sad testimony to the state of this sub-field that most current studies are still single-country monographs or collections of essays), the nature of civil-military relations in Israel may well prove to be an effective control-case for the testing of the resulting hypotheses and models.

The Israeli Defence Forces (Zahal) have remained subordinate to civilian authority (though not without considerable say in defence and foreign policy) despite a variety of circumstances amenable to the ascendancy of military power and influence at the expense of civilian elites. Among these factors are: three highly successful campaigns that have enhanced the popularity and prestige of the military; the constant state of military vigil and preparedness so conducive to garrison-state mentality; huge military budgets and the development of a defence industry complex dominating sectors of the civilian economy; military administration into the sixties in minority areas har-

boring a possible fifth column; a fragmented multi-party system continuously engaged in political haggling; and strong personalities at the helm of the armed forces.

To what extent does Zahal play a role in the decision-making process in Israel and why have the above factors not brought about the ascendancy of the military? Noting some 300 interviews with Israeli officers and officials, and citing an impressive bibliography of English and Hebrew sources, Perlmutter sets out to trace civil-military relations in Israel and to challenge three general hypotheses advanced by Huntington, Andreski and Von der Goltz. Unfortunately, due to the author's over-ambitiousness and the study's brevity (135 pages of text, one third of which is devoted to the pre-1948 era) the result is interesting but very spotty coverage of the topic.

Perlmutter traces the stability of civil-military relations in Israel to several factors, two of which are the absence of a social gap between the military and the rest of society, and the close co-ordination at the highest level of civil and military elites. Zahal is very much a cross-section of Israeli society by virtue of universal conscription, the small size of the permanent force and the periodic promotion, rotation and retirement of its top officers. Retired officers are snapped up by private and public corporations or are integrated in the bureaucracy, all of which provide alternate channels for personal advancement. Moreover, being deeply involved in the nation-building process, there is relative harmony between the values and ideals of military and civilian elites in Israel.

While the absence of a civil-military social gap tends to inhibit the growth of a case mentality or militarism (though Perlmutter presents no hard data on the latter), the character of the civilian Defence Minister and his administrative concepts and skills determine the degree of cooperation or tension that will exist at the authority apex.

One of the first tasks of the nascent state in 1948 was the unification, depoliticization and nationalization of the existing semi-autonomous military formations. With Ben Gurion as Minister of Defence as well as Premier, general spheres of responsibility were drawn between the Ministry and the military itself, though there was no attempt at a strict separation of the civil and military functions as is more common abroad. Entrenched by the passage of time and by Ben Gurion's charismatic and personalist style, these lines of demarcation persisted during Ben Gurion's absences from power to plague reform-minded Ministers. And Ben Gurion's practice of favoring the High Command, "his boys," over the Ministry, also opened the door to possible Ministry-Command tensions.

Perlmutter chooses not to deal in any detail

with either the structural or dynamic features of the civil-military interplay of influence, or the precise manner in which Zahal participates in decision-making relating to defence or foreign policy—curious omissions insofar as these would be central to his inquiry. Instead, in his chronological narrative on civil-military relations he stresses the Lavon Affair as evidence that even in times of intense interelite strain and tension, civilian conflict-resolution mechanisms (in this case the dominant party, Mapai) are operative. Lavon's ambitiousness while Minister of Defence, and his desire to re-organize Ministry-High Command spheres of competence and coordination, isolated him from his source of power, drove a wedge between the Ministry and Zahal and resulted in his downfall. Elements in the military combined with Lavon's own subordinates to topple him. Forgery and perjury was involved. And though the military did eventually purge itself of these elements, the outcome of the Affair was indicative of the lengths to which the government would go to shield Zahal from possible tarnishing circumstances. As Perlmutter summarizes it (p. 134), "in periods when the military and political elites were separate and diffuse, either due to the personalist ambitions of the defence minister (Lavon) or his non-expertise (Eshkol), the Army's effectiveness as a political pressure group was enhanced." Ideal civil-military relations in Israel are achieved under a strong Defence Minister, respected by the High Command and fully backed by his colleagues in the Cabinet.

Perlmutter's study has a number of shortcomings arising mostly out of its brevity. Miniscule chapters result in somewhat superficial treatment of important topics ("Zahal's Role Expansion" covered in ten pages?) and complete neglect of others. The essentially historical narrative approach leaves too many questions unanswered. Is there total unanimity within the Army regarding the ministry-military division of labor? What evidence is there of the cohesion of the military that the author asserts: are there no "hawks," "doves" or empire-builders? To what extent, if any, is militarism gaining ground in Israel? Moreover, despite the excellent analysis of the Lavon Affair as a case study or civil-military tensions, one is still left with only a hazy notion of the precise role of the military in policy-making.

Though some significant tables are presented throughout the book, the study does not utilize much hard data to support various of the author's contentions. The defence budget figures themselves are at total variance with another set provided by the author in his recent article in *World Politics* (XX:4:1968, p. 642)—significant portions of which are incorporated verbatim without appropriate acknowledgment. The original three hypotheses challenged are not dealt with; indeed, the

challenge was quite unnecessary as Israel does not satisfy their stipulated conditions. Finally, inadequate proofreading has resulted in a significant number of printing errors.

In sum, the work promises us much, delivers considerably less and has certain shortcomings. Still, little research has been done in English on this difficult topic and there are significant security restrictions and obstacles to such endeavors. The book can be of use to the reader who will be content with a very general descriptive background picture of civil-military relations in Israel, rather than a detailed analysis. The latter kind is still forthcoming.—SAMUEL DECALO, *University of Rhode Island*.

Politics in the Altiplano: The Dynamics of Change in Rural Peru. By EDWARD DEW. (Austin: The University of Texas Press, 1969. Pp. 216. \$6.00.)

Social scientists are aware of the problems of gathering reliable data on the developing nations. In addition, there is increased concern for the style of analysis; that is, whether the methodology focuses on issues relevant to comprehending political phenomena in an area rather than agreeing with what is fashionable within a particular discipline. Political scientists interested in Latin American politics should consider the contribution of historian Edward Dew's *Politics in the Altiplano* which represents a prudent and effective use of data and a useful theoretical framework for interpretation.

Dew's micro-study of the politics of the Department of Puno in the Southern Peruvian Andes utilizes a group model of political activity. "Politics in any social system," he says, "involves the moderated conflict of system members over different resources in which they have an interest." Any change in the "relative allocation of resources among members of the social system" achieved through conflict constitutes political change. With this definition of politics and political change, Dew examines the "equilibrium" and "conflict" models of political change in culturally plural societies. The former conceives of the social system as composed of different geographic, social, ethnic and occupational groupings with overlapping memberships and loyalties contending for political power. Political brokers serve as moderators and generally succeed in achieving objectives through negotiation procedures rather than violence. The conflict model also conceives of a plural social system, but one in which overlapping membership in group activity is limited or virtually non-existent. If and when the moderation of conflict occurs among contending groups, it is achieved by leaders in a dominant cultural minority. Aware of the contributions and limitations of each model in the

analysis of social systems, Dew examines the politics of Peru's Andean region by using the conflict model and by paying particular attention to the emergence and decline of political brokers within the culturally dominant group and within those subordinate groups which challenge the existing system of resource allocation.

From a variety of primary and secondary sources, statistical studies, newspaper accounts and interviews, Dew marshals supportive evidence for his contention that the politics of the *altiplano* closely resembles the conflict model. Stagnant pluralism has been induced by the existence of extremes in land tenure and the use of land among large and small proprietors, resulting in the polarization of economic positions. When these conditions are combined with geographic isolation, climatic catastrophes and dense population, the resulting society produces a local political system where scarce resource allocation is controlled by a dominant minority within or outside the region.

The *altiplano* political system is further intensified by cleavages resulting from the interaction among racial and functional groups. A *mestizo* elite dominates and exploits different Indian groups but is challenged for control of the political system by newly emergent groups. Commercially orientated *cholos* (Westernized Indians) and *forasteros* (outsiders), unable to enjoy social and political assimilation commensurate with their newly acquired wealth and economic mobility, seek the prestige and power of public office by creating competing organizational structures, such as peasant syndicates and personalistic political parties. Political competition between two urban centers, Puno and Juliaca, reinforces conflict between *mestizos* and *cholo-forasteros*, as they compete to control the allocation of public works, an airport, roads, welfare funds, industrial projects and public offices. The lessening of polarized conflict within the region occurs when the *altiplano* brokers, principally congressmen, for reason of a natural disaster (drought, flood), achieve a united front to demand greater resources from the national government. Moderated conflict may occur under such circumstances, but the *altiplano* leaders themselves must contend with national political parties seeking power in the region. Dew asserts that common interests, which had served to unify regional leadership during emergencies, no longer provide a method of conflict moderation because the creation of a regional development agency (*Corpuno*) has increased the conflict over *who* will generate resource allocation. Further divisiveness is created when *cholo* political leaders build syndicates as means to mobilize political support and thus increase expectations among peasant farmers. Local political brokers often find themselves in precarious positions and, forced to take sides in a

conflict, are unable to maintain themselves in positions of influence for any great length of time.

As Dew points out, this study should not be regarded as a definitive statement on conflict and cleavage in the *altiplano*. However, the conflict model as used here has some validity. It sheds considerable light on the *altiplano's* tentative political system where economic and social conditions often polarize contending groups and induces aspiring politicians to use a variety of means—some violent, others non-violent—to mobilize political power and to control resource allocation.

Some political scientists will find weaknesses in Dew's treatment of political attitudes and elections. Evidently, he relied on unsystematic personal interviews with political activists, informants and American research personnel as well as secondary works to draw some inferences on Indian and *Mestizo* attitudes. Dew details the power struggle among local politicians during the congressional elections of 1962 and 1963, but the results of the elections could have been made more meaningful if he had considered the intricacies of proportional representation and apportionment on the outcome of the two elections.

Aside from these minor criticisms, Professor Dew has provided students of Latin American politics with an effectively researched and theoretically significant case study of the politics of one of the more remote regions of Latin America. A bibliography and an excellent index are included in this volume.—ORVILLE G. COPE, *University of Wisconsin-Milwaukee*.

Institutionalizing the Grass Roots in Brazil: A Study in Comparative Local Government. BY FRANK P. SHERWOOD. (San Francisco: Chandler Publishing Company, 1967. Pp. 173. \$2.95.)

This compact little volume underscores the paucity of analytical studies on the Brazilian political system. Taken as a relatively modest effort to discuss basic features of local government in Brazil, it could be welcomed as a useful, albeit rather limited contribution to the growing comparative literature in this field. Yet the absence of any full-scale analysis of the Brazilian political-governmental system since Karl Lowenstein's *Brazil Under Vargas* appeared more than a quarter century ago places a burden upon authors of this type of monograph, since only in the rarest cases will readers be familiar with even the basic features of the polity involved. Some such as Richard Graham in his recent *Civil Service Reform in Brazil* (University of Texas Press, 1968), are relatively successful in dealing with this problem by sketching a meaningful if very basic model of the national political system. Unfortunately Professor Sherwood has failed to respond to this challenge. The scant two pages devoted to "Brazil Sociopol-

itical Development" are not only too grossly oversimplified to effectively distinguish it in very fundamental terms from other countries, but make no effort to alert the reader to the existence of relatively adequate English language sources covering the crucial factors of environment, history and political culture the author caricatures more than characterizes. In other respects as well Professor Sherwood promises the serious student of politics a good deal more than he delivers.

Dr. Sherwood's book, in spite of efforts to mask the fact by using fashionable disciplinary terms for often commonplace observations, reflects a carryover of the once prevalent distinction between politics and administration. For when we move from his language to the level of his ability to handle the subject matter, the author does precious little with the substance of political life. Although an effort to deal with politics in a modern manner is clearly present, complete with a rather mechanical adaptation of the system-functional approach, the analysis is disjointed and rarely escapes superficiality. Description of selected institutional arrangements is often quite good, but the real nature of the Brazilian political system remains hidden from the reader.

It is where his strengths as a specialist in municipal administration bear most closely on the subject under discussion that Professor Sherwood is most adequate. Thus he demonstrates considerable facility in dealing with the legal, structural, and service aspects of local government and enjoys some success in applying Selznick's concept of institutionalization to the Brazilian *município*. Greater difficulty is encountered in utilizing a systems approach to explain the limited role and effectiveness of the "community municipal system" and its national aggregate in Brazil. Here part of the trouble comes from Sherwood's failure to consult the most relevant of Almond's works available at the time he was writing (*Comparative Politics, A Developmental Approach*). Emphasis upon capabilities analysis as introduced by Almond into his scheme in this 1966 work, might well have served Sherwood better than his partial application of conversion functions. As it is, he has grasped more of the terminology than the substance of this influential approach.

Where Sherwood does treat of politics rather than government, chiefly at the formal level of elections, he is prone to significant factual errors as well as superficial interpretations based upon a very limited familiarity with appropriate sources. Thus he states on page 15 that in the 1962 São Paulo governorship race the winner received 37.8 percent of the vote to the runner-up's 24.1 percent. Since the margin was roughly 125,000 votes in a turnout of better than 3.3 million, his figures—for which he cites no source—were very far off

the mark indeed and obscure the important point that Adhemar de Barros won as the result of a last moment stop-Quadros movement which saw ex-President Kubitschek almost on the eve of the balloting divert the support of his party from the third candidate to de Barros as a less dangerous potential rival in the 1965 presidential campaign than a rehabilitated Quadros would be. Instead of tapping the relatively rich body of community power studies, Sherwood offers a largely pointless reportage on a single municipal council meeting in a provincial town, admitting at the same time that he could not follow what was going on and did not bother to stay around for more than the first hour. (pp. 107-112)

The book's weakness in the field of systematic political analysis is accentuated by the absence of any awareness of the relevant work by Brazilian political scientists. While drawing heavily rather than widely upon the appropriate Brazilian public administration studies, Sherwood has apparently neglected to consult political science literature which treats many of the problems he skirts more than he faces. Thus, for example, the only use the author makes of the work of such a prolific and internationally known Brazilian scholar as Hélio Jaguaribe is to overuse an analytical tidbit discovered second-hand in an article by an economic historian on Pernambuco elections. (Indeed, he passes up far more rigorous work on electoral politics in favor of over reliance upon this volume of very uneven quality and doubtful analytical value.) To add injury to the insult of ignoring Jaguaribe's really relevant work, particularly the fecund concepts of the clientelistic system and "cartorial" state, Sherwood badly mangles his citation (putting the name of the journal as the title of the article and stating that the publisher is unknown.). Moreover, it is difficult to imagine how the author could use very inadequate sources for his section on "The Political Consequences of Industrialization and Urbanization" while ignoring the work of Glaucio Dillon Soares who, although a Brazilian, has long been associated with such U.S. institutions as Washington University (St. Louis) and the University of California (Berkeley). First available in English as far back as 1964, Soares' revised paper on "The Politics of Uneven Development: The Case of Brazil" appeared in 1967 in Seymour Lipset and Stein Rokkan's well-known volume on *Party Systems and Voter Alignments*. Similarly, Sherwood's complete neglect of populism as the most important single concept in the complex politics of the great metropolitan center of São Paulo combined with over-reliance upon the misleading label of conservative for Adhemar de Barros tends to obscure the really interesting and significant aspects of the one area he selects to focus upon most closely. Whatever benefit of a

doubt might be extended to Dr. Sherwood regarding neglect of Brazilian scholarship, even that available in English, the same charity is strained by his failure even to mention the solid study of Brazilian local government by Dr. Carr L. Donald (a 1959 University of Texas doctoral dissertation from which two articles were subsequently published in such widely available journals as the *Western Political Quarterly* and *Inter-American Economic Affairs*).

In sum, Sherwood's study clearly adds to what is available in English on the narrow topic of Brazilian local government in a manner particularly meaningful to students of municipal administration in this country. It is equally apparent that this book does not contribute more than marginally to a deepened understanding of the political system of this discontinuously modernizing subcontinent which is on the verge of joining the exclusive club of countries with more than 100 million inhabitants. In this regard, the piece of the Elephant perceived by the author is not a vital part of the beast, while the developmentally critical aspects of political institutionalization do not include the narrow facet fastened upon in this work. Indeed, the very limited local authority described by Sherwood has been further restricted and eroded since the cut-off date of his book.—RONALD M. SCHNEIDER, *Queens College of the City University of New York*.

How The Conservatives Rule Japan. BY NATHANIEL B. THAYER. (Princeton: Princeton University Press, 1969, Pp. 349. \$10.00).

Postwar Japan has been ruled continuously by the conservatives, except for a brief ten-month period in 1947-48. Yet few attempts have ever been made to study in depth the organizational and psychological determinants of their behavior. The book under review is the first major work focusing directly on the intricate mechanisms of conservative rule. As a pioneering work it admirably fulfills its mission. For the first time the organization and behavior of the Liberal Democratic party are subjected to a seasoned political scientist's systematic and critical observation and analysis.

Nathaniel Thayer starts the book with a detailed discussion of the dozen or so factions in the Liberal-Democratic party, which he regards as the focal points of Japanese political processes. "The Liberal Democratic party," he contends, "is an amalgam of personal power lodged in the factions and institutional power lodged in the party organs." (p. 14) In the eight substantive chapters which follow, the author proceeds to describe and explain in terms of this delicate balance between personality and institution the roles and influences of the business community and the official party organs, the logic and psychology of the electoral

politics, and the processes of intra-party personnel administration and policy making. His descriptions have a quality of extraordinary intimacy and drama, while his analysis is both disciplined and precise.

This of course does not mean however, that I agree with all of the author's observations, arguments and conclusions. On the contrary, I happen to disagree with his views in more than a few cases. In fact, I find some of his statements either outright erroneous or highly misleading, as when it is suggested that every standing and special committee of the Diet is chaired by a conservative, or that the Diet policy committee of the Liberal Democratic party consists of only about seven members. (p. 286) The fact is that the chairmanships of a few upper house standing committees and half or more of the special committees in both houses are customarily allotted to the opposition parties, while the party Diet policy committee regularly consists of over twenty-five members in addition to a chairman and several vice-chairmen. In an effort to prove the relatively high turnover rate of conservative members of the Diet, the author points to the high percentages of the quondam and new faces elected in each of the last four lower house elections. (p. 145) From this he concludes that the "new blood" thus imparted revitalizes the old organs. He should have noted, however, that more than half of these men were quondam, rather than new, faces and should more properly be regarded as part of the "old blood." In the discussion of the ratios of bills sponsored by individual members to those sponsored by cabinets the author also fails to mention that the bulk of the former category of bills are introduced by opposition members. As a result, the reader may be left with the wrong impression that individual members of the conservative party are responsible for the introduction of a substantial proportion of the bills.

In some cases I find Thayer's arguments ambiguous and confusing because he does not explicitly define the key terms and contexts. At one point he contends, for example, that "factions are built on the struggle for power and the seat of power is the lower house" (p. 49), and that "the factions didn't produce the leaders" but "the leaders produced the factions." (p. 56) The validity of these statements depends on what is meant by "power" and "leaders." Elsewhere he argues that the close association which the business community maintains with the politicians is not censured but rather approved by most *responsible* critics. (p. 75) Considering the criticisms against such association frequently voiced in the press by various critics, the reader would be interested to know which critics are the responsible ones and which are not and why. Likewise, the author blandly states that as a rule prime ministers, assisted by

the faction leaders, pick talented and capable men for cabinet posts and, as a result, "the Japanese people get as good a crop of ministers as they can expect." (p. 206) But by what standards are they deemed more or less talented or capable than others? There are also a few sweeping and unsubstantiated generalizations which may well cause some readers uneasiness. For example, the author simply declares that the Japanese have "always placed greater stress on personality in government than they have on institutions," (p. 4) or that the Japanese newspapers have consistently been "vicious in their attacks on the parties, particularly the conservative party." (p. 109) To me neither seems to be self-evident.

Much more serious from a methodological point of view, however, is the author's tendency to treat with almost unreserved confidence the opinions of his informants—many politicians and newspaper reporters and a few scholars. The extensive utilization of the information gathered by the author through conversations with these informants no doubt accounts for the extraordinarily vivid and absorbing narrative which distinguishes this book. On the other hand, his excessive and uncritical dependence on these sources seems to have seriously interfered with the author's own sound reasoning and judgment. For example, a conservative politician is quoted as saying, "In the old days, the young Dietmen used to spend all their time getting prepared for speeches in the Diet." (p. 40) Yet the author himself mentions elsewhere that many followers of the prewar factions, such as those led by Hatoyama Ichirō, used to meet regularly outside the Diet. (pp. 18-19) Another politician is quoted as saying, "Most councillors can anticipate . . . appointment to a cabinet post after their second election." (p. 52) The substance of this statement is patently wrong. A journalist's view quoted at some length to the effect that the leaders of the nation's business community have been unanimously urging the government to liberalize the flow of foreign capital into the country (p. 69) sounds only more incredible. Some of the uncritical quotations from written sources are no less damaging, as where Kōno Ichirō is quoted as stating that the powerful prewar Diet members "would not permit the existence of pressure groups" (p. 221), as if the *zaibatsu* had either been non-existent or completely devoid of political influence. I believe that such uncritical acceptance of the informants' judgments resulted in the one major flaw of this otherwise superbly written book.

These shortcomings are, however, far outweighed by the book's many obvious strengths. Most, if not all, of the broad generalizations put forward by the author are penetrating and incisive. For example, it is difficult to find fault with

his judgment that "the role of the Diet as a forum for making of policy is limited," that the policy affairs research council of the conservative party plays a role far more critical than has been credited to it. (p. 236), or that as an institution occupying "a central position in Japanese politics," the support organizations (*kōenkai*) of individual politicians deserve a much more serious attention than they have hitherto received. (p. 88) In connection with this latter point the author provides a most informative description of one specific example of a conservative politician's support organization. (pp. 89ff) I would hope that this will inspire others to look more closely and systematically into the anatomy of these evasive but critically important structures. The book will hopefully encourage interest also in areas of the conservatives' rule which Thayer has, for very good reasons, left virtually untouched. One such area is the relationships between the conservative politicians on one hand and, on the other, the opposition parties, and the national and local government bureaucracies.—HARUHIRO FUKUI, *University of California, Santa Barbara*.

Haile-Selassie's Government. By CHRISTOPHER CLAPHAM. (New York: Frederick A. Praeger, 1969, Pp. 218. \$7.50.)

The government of Ethiopia is Haile-Selassie's government. Its major personnel, with certain qualifications, have been chosen by him, promoted, demoted and transferred by him. "Their" decisions, until recently, were made by him. This view of the government has been traditionally held by students of Ethiopia's politics, and it is sustained in Clapham's new book. It is the strength of this work, however, that it attempts both to document and to qualify these assumptions.

In a culture notorious for secretiveness and hostility towards foreigners, Clapham, an Englishman, was able to acquire a great deal of rather candid information from "innumerable conversations with Ethiopians in the government." From these conversations, he has put together a far more complex picture than we have previously had of the highest ranking personnel of the government, their relationships with each other, and to the Emperor, and the ways in which they have shaped, and been shaped by their institutional positions.

Clapham analyses not only individual careers and clique behavior but differences among individuals of different traditional status (noble and non-noble) and of different educational generations (no education, pre-war or post-war education). Central to this analysis of the relationships between the Emperor and those around him is its developmental emphasis. Immediately after liber-

ation from the Italians, the government consisted almost exclusively of the non-educated, largely noble but with some infusion of those whose only claim to office was the Emperor's favor. Conflict and co-operation among these men was designed to win the Emperor's favor and the rewards of that favor: positions, wealth, and "power." Since this government had little impact on life in Ethiopia, the power to be attained was relatively slight.

Since that time the non-educated have been replaced by the educated, with those educated prior to and immediately after the war now holding the highest positions, and subsequent students manning their bureaucracies. Government activity and personnel have enormously expanded, reducing the ability of any individual to know of, or to control its activities. One consequence has been a limited decentralization of power from the Emperor to Prime Minister, Council of Ministers, the various ministries, and Parliament.

These changes are described in some detail, with occasional illustrative case studies. While such description adds much to our understanding of Ethiopian politics, and is extremely necessary, Clapham never transcends description. Thus, while he shows an obvious concern for questions of relative power, he does not attempt to spell out a concept of power. Nor does he explicitly assess or measure the distribution of power among the various participants, despite periodic references to the amount of power held by an individual or institution. "But in practice, these great powers (those of the Emperor) have constantly had to be made good by effective leadership, and enforced through military strength." "But the Emperor's effective powers have often been far less than his formal supremacy would lead one to suppose." "The strength of groups is reflected both in policies and appointments. As the nobility has declined in power, so has the number of noblemen in the government; and as the influence of modernising groups has increased, their numbers have been brought into the government, and some reforms have been granted in order to retain their support or acquiescence."

Another major weakness is the failure to assess adequately the relationship between Haile Selassie's government and the society it "rules." Clapham says, "... it is by no means obvious whether the undoubted changes since 1941 have gone to the foundations of the government, or whether they should be regarded, rather, as peripheral modifications, to a political system which remains basically unaltered." What he does not say, or ask, is to what extent changes in the society and economy (in particular the fairly rapid extension of elementary and secondary education) shape the answer to that question.

Finally, his methodology, "conversations with government officials," provides us with no inde-

pendent check on his findings. We don't know to whom he spoke, what he asked them, or how much agreement there was among his informants. My criticisms—the lack of conceptual clarity, the failure to treat seriously government-society relationships, and a journalistic methodology—reflect my disappointment that the first major work on Ethiopian politics in twenty years is as traditional as if it had been written twenty years ago. It shows no signs that Clapham is aware of or interested in the intellectual ferment characteristic of the study of comparative politics in general and the study of African politics in particular.—ROBERT D. GREY, *Grinnell College*.

Politics and Government in Turkey. By C. H. DODD. (Berkeley: University of California Press. 1969. Pp. 320. \$7.95.)

Within the compass of a modestly sized book, the author succeeds in presenting a useful interpretation of Turkish politics, particularly since 1961. The book is concerned primarily with the analysis of governmental institutions and seeks to "lay emphasis on what actually happens, in and through the political and administrative institutions that seems significant for the making and agreeing of policy and for deciding who should exercise political power." (p. vii) In order to do this, the author provides an introductory section, which is, at best, an overview. His discussion of the Ottoman legacy offers nothing very original. However, the emphasis on Ottoman efforts at political reform serves as a backdrop to later developments which are examined in much greater detail.

Particularly thin is the coverage of the impact of Mustafa Kemal Atatürk and the efforts at modernization and westernization in the early years of the Republic after 1923. Additional detail in this area would have greatly benefited the ensuing study of the rise of the anti-Republican movement in the 1950's and 1960's.

The lengthy section on political organization offers a thoughtful and critical analysis of the structure and functioning of the Turkish political system with very useful sketches of the parties and their positions in the overall system. The same ability is displayed in providing an excellent, though brief, indication of the role of important pressure groups. Most useful, perhaps, is part IV entitled "Administration." A valuable examination of the Turkish Civil Service is presented on pp. 223-305. This is based in part on original survey research into the socio-economic, educational, and employment backgrounds of civil servants. The results of the rigorous field approach are clearly suitable for comparative analysis which attempts to measure and explain the behavior of civil servants in more than one country. The discussion of the administrative system is somewhat weakened

by the limited attention given village and rural administration in so far as these have to do with the total political scene in Turkey. Since villagers account for over 70 percent of the population and since there is currently great emphasis in Ankara's policies and plans on rural development (e.g. the Ministry of Village Affairs established in 1964), there would be a lot to gain from a more penetrating examination of the villagers as a political force and of the village as a unit of the political-administrative hierarchy. As it stands, the greater emphasis is clearly on the provincial administrative structures and their links with the central government.

Despite the wealth of information presented by the author, he does not seem to have had access to private and public documents other than those available to everyone. This could be explained by the political climate in Turkey which complicates research into political matters. Most of the documents referred to are Turkish language materials, mostly official and party publications. The author admits (p. vii) that he has relied heavily on materials available outside Turkey, mostly newspapers, though why this should have been so is not clear since he apparently spent some time in the country and, presumably, has a familiarity with the language.—ABBAS AMIRI, *Kent State University*.

Elements of Nordic Public Law. By Nils Herlitz. (Stockholm: Norstedt, 1969, Pp. 287. Sw. kr. 52.)

The first two volumes of Professor Herlitz' *Nordisk Offentlig Rätt* were noted in the March, 1959, issue of the *Review* (p. 242). They trace the history of public administration and explain the workings of the national legislatures in Denmark, Finland, Iceland, Norway and Sweden. The third volume of this series was described in the March, 1964, issue of the *Review* (pp. 157-158). It presents the constitutional law of the five countries. Both earlier reviews ended with the comment that "[m]uch more of Scandinavian letters and science should be made readily available to English speaking audiences, and not least Professor Herlitz' *Scandinavian Public Law*."

While there is no evidence that this plea was directly heeded, it is gratifying to see that Professor Herlitz has used the earlier volumes as the basis for the book presently under review, particularly for the chapters on constitutions, parliaments, governments, courts, and public administration. Some new materials are added on individual rights and on Nordic integration. Out of 54 works sponsored by the Institute for Legal Research, this is the second to be published in English.

Dr. Herlitz is Professor emeritus in the law faculty at the University of Stockholm. He writes

clearly, and is extremely well-grounded in his subject. His approach is historical and analytic, juxtaposing the salient political institutions of the four larger Nordic countries. *Elements of Nordic Public Law* provides a sound introduction to Scandinavian government. Its usefulness as a reference work is enhanced by the inclusion of a systematic survey of the literature, an index, and a glossary.

Scandinavian legal and political history is a

third current in the Western stream; it cannot be classified as common law or continental, although it shares much with each. Swedish constitutional law, in particular, has a strong indigenous quality. The unique institution of Ombudsman and the principle of public access to official documents illustrate this originality and indicate that there is much of value to be learned from the quiet northern corner of Europe.—STANLEY V. ANDERSON, *University of California, Santa Barbara*.

INTERNATIONAL POLITICS, LAW AND ORGANIZATION

Linkage Politics: Essays on the Convergence of National and International Systems. EDITED BY JAMES N. ROSENAU. (New York: The Free Press, 1969. Pp. 352. \$8.50.)

There is a widely admitted need to unite the conceptual frameworks of comparative and international politics. This collection of twelve papers attempts not to satisfy but to whet our appetites for such a union.

Rosenau's keynote essays correctly reprove the lack of communication between comparative and international studies. He underlines the importance of studying the impacts of external variables on internal politics, of internal variables on foreign policy. As a means to the amalgamation of the separated fields he then develops a major typology, his "linkage framework." The typology contains $9 \times 6 \times 24$ cells: it distinguishes nine types of linkage between six aspects of the international environment and twenty-four features of national politics. Four of the national-polity features were selected for examination in this volume, and the authors of the empirical studies were invited to fill $9 \times 6 \times 4$ cells with polity data. None of the cells could be filled with a simple quantitative coding of readily available data; all required a qualitative analysis, sometimes of not yet collected data.

To fill a three-dimensional block of 216 such cells on one case would have been something of an ordeal. With stoical courage, the authors agreed to attempt comparison as well: each would examine not one polity, but two, three, four, and entire region, or "underdeveloped nations" *en bloc*. These sets were selected for comparison because their members have one major resemblance, usually one extraneous to the linkage framework. Except where sets of polities belonged to one region, the authors were not usually specialist students of all their polities. These enterprising decisions multiplied at a stroke the number of data cells the authors were in principle doomed to fill. Under this burden not the authors but the cells collapsed. Instead of the nine linkages, authors took a few main ones; the six international environments

were sometimes reduced to one; the four polity features were often maintained, but sometimes replaced by others. Where the number of states for comparison was few, they were studied as faithfully as the data allowed; but "Latin America" and "the underdeveloped nations" could not be treated individually, and consequently were treated as wholes or as abstract prototypes. By these expedients the authors survived, but the unity of effort did not. The authors drew back from the full magnitude of their assigned task, not in disorder, but by different roads. The tactical retreat was clearly necessary, as Rosenau points out frankly in his introduction to the volume. But as a result, achievements, rather than intentions, must be reviewed here; and, according to the authors' expressed wishes, their efforts must be treated as preliminary.

One of the essays, by William G. Fleming, begins a quantitative scrutiny of Ghanaian and Ugandan elite attitudes and transactions with foreign states. Two more, one by Robert T. Holt and John E. Turner on island nations, the other by Richard L. Merritt on states whose territories are divided (by water or by intervening states), attempt to reintroduce geographic factors into the generalizations of comparative politics: they present a number of hypotheses worthy of investigation; but their factors of "insularity" and "non-continuity" seems less salient, hence less in need of investigation, than mere location (i.e., proximity to superpowers, enemies, economically advanced or politically dynamic states, etc.).

Three more articles weigh external against internal impacts on foreign policy, and the other three examine external impacts on internal politics. Both attempts fulfil the main real aim of the editor, which is to persuade students of comparative politics to introduce "external" or "environmental" explanatory variables into their discussions of domestic politics, and students of foreign relations to accept "internal" variables as necessary instruments of their explanatory work.

Lloyd Jensen summarizes internal and external

impacts on the defense policies of the three great states defeated in World War II, and concludes modestly and sensibly that the external environment has been critical in influencing policy, with the internal "environment" of increasing importance over time except in periods of internal political instability. Michael O'Leary offers a commentary on Morton A. Kaplan's system theory, and tries to extend that theory by further differentiating types of state-actors. O'Leary hypothesizes that, while in an unintegrated system strong and stable states will find the lack of integration of the system useful to them and will hence act to preserve it, weak and unstable states will find their weakness intensified in an unintegrated system. The latter will consequently violate customary (and system-maintaining) norms, and seek to change the system. In breaking a limited amount of new theoretical ground, O'Leary also presents some unconventional insights into the foreign policies of contemporary "less developed" states.

Ole R. Holsti and John D. Sullivan compare quantitative data on the "positive" and "negative" externally-oriented behavior, physical and verbal, of two "nonconforming alliance members," France and China. They find evidence consistent with the hypothesis that nonconforming behavior in a monolithic bloc, if successful, tends more to spill over into many issue areas than similar behavior in a pluralistic bloc. The hypothesis needs to be examined in other cases: one thinks today of Rumania and Hungary, if not also Cuba, North Vietnam, and North Korea, as limited non-conformists, and Cuba after 1959 as a thorough nonconformist in a pluralistic bloc.

In one of the studies of outside impacts on domestic politics, Bernard C. Cohen achieves a collection of brief and suggestive impressions of the particular impacts of the international environment on the origins, socialization, methods of struggling for power, and support groups of American politicians. In a second, R. V. Burks compares East European Communist states in 1952 and in 1968, with respect to Soviet influence in appointing leaders, making policies and setting ideologies. Since the conventional wisdom of East European specialists is here presented in more abstract terms, the essay is generally convincing; but it retains several conjectures palpably overthrown by the invasion of Czechoslovakia. Finally, Douglas A. Chalmers presents a brief survey of widely admitted and long-standing external influences in Latin American society, political culture, political groups, political issues, and power structures. Chalmers experiments somewhat with his conceptual framework; his alternative typology will be more immediately helpful in persuading "traditionalist" students of comparative internal politics to give external impacts explicit attention in their

explanations than will the original linkage framework. Cohen's paper, although the least finished of the three, makes the boldest departure from conventional subject matter, since external impacts on East European and Latin American politics have been more widely noted than present-day external impacts on American domestic affairs.

All nine substantive essays are clearly unfinished, and are not otherwise advertised. Cohen's essay for its subject matter, Chalmers' for its conceptual scaffolding, and O'Leary's for its theoretical interest, definitely demand and deserve further research. All the rest could be carried to their conclusion with some profit; the likely novelty, relevance, salience, and rapidity of results seem much higher for some (especially Holsti and Sullivan) than for others.

As for the broader framework, it deserves to survive and to be used, and even, as a supplementary theoretical essay by J. David Singer suggests, to be enlarged. But practice should lead to amendment. Useful ideas are given distracting labels: "output" means stimulus and "input" means response; "direct" and "indirect" are substituted for "intentional" and "unintentional;" and "fused" means "reciprocal." This terminology should be overhauled. The linkage framework itself needs to be haggled over and revised in light of some of the difficulties expressed in this volume by the authors who employed it.

Collaborative work of this sort should and will increase in future, at least in international and comparative politics. But a warning whispers from the pages of this book: the architects of elaborate conceptual frameworks must give their "masons" manageable jobs. Had the substantive authors in this book been confined to one country apiece (and that one well-known to them), and had they been kept to the one-way impact of the external environment on one feature of (for instance) internal political leadership in that country, they would have had only 4×6 data cells each to fill. If the authors had then engaged, individually or jointly, to do explicit theoretical work (as Chalmers did) to cut down the cloth of the framework to fit the body of the case, this effort would have been less ambitious, but its results less preliminary.—DAVID WILKINSON, *University of California, Los Angeles*.

Vietnam: Issues and Alternatives. Edited by WALTER ISARD. (Cambridge: Schenkman Publishing Company, 1969. Pp. 213. \$5.95.)

Unquestionably, a collection of essays on Vietnam by social scientists is of timely interest and importance. And this volume has much to recommend it by way of suggesting original and potentially workable procedures for the resolution of the Vietnam War. However, adequate treatments

of certain outstanding issues inextricably associated with this conflict simply are not to be found in this volume, and this perhaps is its major failing.

This book is an edited volume of twelve papers delivered at the June 1968 Conference of the Peace Research Society (International). Essays in this volume range from studies of the South Vietnamese village to one involving conflict between the great powers. The book is enlivened at the outset by something of a debate on village authority structures in the form of two papers, one by Ithiel de Sola Pool, and the other by Samuel L. Popkin. Attitudes of the South Vietnamese are treated by Ralph K. White, and those of the American public are analyzed by John P. Robinson and Solomon G. Jacobson. A methodologically sophisticated analysis of the views of American social scientists on Vietnam is presented by Philip Brickman, Phillip Shaver, and Peter Archibald. The cold war is introduced in an essay by Robert Strausz-Hupé which suggests that a solution to Vietnam is dependent largely upon agreement between the United States and the Soviet Union. A paper by David C. Schwartz takes Pool to task for not employing explanatory models of conflict behavior, now readily available to social scientists. More on this later.

The last section of the book on analytic models is by far the best. Nigel Howard applies his metagame theory in an analysis of the Vietnam War. Rather than using a classic game with its limitation of discrete moves in a single confrontation Howard develops a prisoner's dilemma metagame in which each protagonist is allowed to react to the other's choices. This approach has the virtue of allowing an overall analysis of policy interaction. However, as Thomas C. Schelling points out in his perceptive critique of Howard, the distinction between a game and metagame is of limited utility, for the game itself, if properly constructed, will include the policy options found in Howard's metagame. Further, Howard's analysis depends on the exclusion of certain alternatives at the outset which, according to Schelling, may constitute an oversimplification of the real-world situation. Despite these criticisms, and the additional lack of a strict isomorphism between Howard's treatment of Vietnam and his own theory, his analysis has a logical and intuitive appeal. By determining the sanctions and equilibrium conditions associated with various policy options, one may use the metagame to indicate the probable outcome of the conflict.

Walter Isard supplements the Howard approach by suggesting a step-wise disengagement of the contending forces, with each protagonist at each stage of the process having the power to veto a move to the next stage. Isard's procedure has the

advantage of specifying quantitatively (assuming appropriate units of analysis at the outset) the maximum amount of disengagement that can occur at each move. Allan E. Goodman's identification of three alternative diplomatic-strategic options for ending the war is a useful addition to the Howard-Isard analysis.

This section and the book close with a quantitative analysis of the Vietnam War by Jeffrey S. Milstein and William C. Mitchell. Using a variety of measures pertaining to the war, the authors calculate multiple regression equations and simulation models of the conflict. When the simulation are used to forecast aspects of the conflict for later periods from earlier data, approximately 50% of the variance is "explained," which is a notable achievement. And the finding of an increase in North Vietnamese infiltration when the U.S. bombings of the North were escalated, is a contribution to our understanding of the dynamics of the conflict.

The Milstein and Mitchell analysis demonstrates an impressive power of the social scientists to predict the future course of a conflict. Yet a thorough understanding of the dynamics of this conflict relies, at least in part, on those explanatory variables which pertain to the onset of the conflict. One can ask further whether prediction without causal forms of explanation maximizes the process of scientific discovery. Astronomers as early as Ptolemy were quite successful at predicting the motion of the planets, but it was not until the explanatory models of Copernicus and Galileo that astronomy could be said to have rapidly emerged into its scientific stage.

There are other questions which this book addresses only tangentially, or not at all. First, there is a lack of articulation of normative preferences in the form of ethical or political desiderata. The ethical problems associated with the American involvement in Vietnam are not dealt with sufficiently. Nor do we find an analysis of a justification for the American presence in Vietnam either from the perspectives of international law, a presumed domino effect, or the expectation of fighting a much larger and bloodier war in the future, if not for the American presence. Pool is somewhat exceptional in that he does indicate a preference for the present South Vietnamese government, the pacification of the countryside, and the viability of both. White deserves credit for attempting to handle the tacky problem of what constitutes aggression, and using survey evidence to suggest that the pro-Vietcong South Vietnamese outnumber those who oppose the Vietcong.

A final problem of omission concerns the absence of a treatment of a possible deterioration of the American power position as a result of Viet-

nam. At the risk of using the review as a vehicle for the presentation of one's own research, it must be noted that the general posture of the United States with its multifarious alliance commitments and Vietnam War involvement may constitute a net power loss to this country. The exercise of power can be defined as the process of reducing uncertainty. Yet the aggregation of a large number of alliance commitments by a major power to smaller ones may constitute an increase in uncertainty. Neither events within the smaller country nor many of its interactional interactions are subject to regulation by the major power. Certain of these events or interactions may involve the smaller country in war which then, via a formal or informal alliance obligation, may include the major power as well. One can also understand a power loss to the United States from the more traditional perspectives of a weakening of internal cohesion and a possible diminution in international prestige.

This book then, contains interesting and sophisticated methods of data analysis, and more important, certain innovative procedures for conflict resolution. A significant contribution to this volume is the excellent "Introduction and Overview" by Isard. But for treatments of critical issues such as explanatory models of the conflict, normative criteria for evaluation of the American presence in Vietnam, and the effect of the War on the United States both domestically and in international affairs, the reader will have to look elsewhere.—MANUS MIDLARSKY, *University of Colorado*.

Controlling Small Wars: A Strategy for the 1970's.

By LINCOLN P. BLOOMFIELD AND AMELIA C. LEISS. (New York: Alfred A. Knopf, 1969. Pp. 421. \$8.95.)

Should the United States adopt a new strategy towards conflicts that do not involve direct confrontation between the superpowers? Yes, say the authors of this book and proceed to suggest, on the basis of their analysis of past conflicts, what such a strategy might look like. Briefly, the new strategy would replace military intervention with conflict control; the objective of repelling aggression at any cost should give way to "avoiding or minimizing violence" (p. xiii); and the means used to deal with conflict would be multilateral, long-range, political and economic, rather than unilateral, short-range, and predominantly military. In view of the less than complete success of U.S. policy toward local conflicts, it is hardly surprising that a new strategy is required and the one suggested by Bloomfield and Leiss echoes, in a systematic, comprehensive and well-articulated way, many of the suggestions made by scholars and policy makers in recent years.

However, if this book were no more than an exhortation to our national security establishment to expand its horizons, it would be relatively uninteresting to political scientists. What merits our attention is the authors' theoretically ambitious effort to understand all "small wars" and to develop specific measures to prevent, control, and terminate them.

They begin by defining "conflict" as that part of any "substantive dispute" which is "regarded in military terms by one or both parties" (p. 13). The dispute is then divided into a sequence of five phases: I. Non-military, II. Pre-hostilities, III. Hostilities, V. Post-hostilities; V. Non-military, plus a final stage, settlement of the dispute. The three middle phases constitute the conflict. In each phase, the authors claim, some identifiable factors work to push the dispute into the next phase and other factors tend to retard the transition. Consequently, they assert, conflicts can be mitigated by policy measures that counteract the first set of factors and reinforce the second.

The authors identified fifty four post-World War II conflicts in the developing world. Of those they selected fourteen for intensive study and, of these, five appear in the book: the Soviet-Iranian Conflict, 1941-1947; the Bay of Pigs, 1960-1961; the Greek Insurgency, 1944-1949; the Indonesian War of Independence, 1945-1949; Conflict in the Middle East 1956-1967. Thus while some aggregate data are presented on all fourteen of the studied conflicts (chapter 3), the application and utility of the conflict model have to be judged on the basis of the five detailed case studies. Each case begins with a chronological narrative divided into the phases (and sub-phases) of the model. Next, the factors bearing on the transitions from phase to phase are listed and opposite them (literally) the possible control measures—at least one measure per factor. Then comes a section on the weapons available to each side; and finally, the control measures are summarized and those that were actually taken are indicated.

Clearly, if the book succeeds, it would contain not only an enormously useful technique for policy makers, but also a major contribution to the analysis and understanding of conflict. But how successful is the book in either of these capacities? Unfortunately, the success is at best highly speculative since the technique used seems to be based entirely on speculation.

Few will deny that one of the best ways to prepare for the future is to study the past—the only problem is how to do it. The authors call their approach "historic-analytic," but what they actually do is isolate certain historical events in time and space, impose a chronological structure on them, and then, by what can be called the "might-have-been" method, suggest measures that would

have changed the course of these specific events. Such measures, they hope, will serve to alter similar events in the future. This is, of course, a well-known historiographic approach, but to make it the basis for a broad-gauged strategic policy study raises many serious methodological and substantive problems, only some of which can be briefly stated here.

First, there is the matter of selecting the events to examine. In this project the following criteria were used: (1) local conflicts, (2) outside Europe (with one exception), (3) since World War II, (4) in which armed forces of the Soviet Union and of the United States were not *both* directly involved and (5) which involved a serious threat or violence or actual violence. (p. 44) The fifty-four conflicts that form this class are then further reduced to fourteen on the basis of such additional criteria as conventional and unconventional warfare; internal, interstate and colonial conflicts; superpower involvement; degree of controllability; and geographic distribution. It is not made clear what further criteria were used to select the five cases actually presented. The point is that once so many characteristics are introduced it becomes impossible to say what the cases in the book exemplify, and whether the analyses, findings and especially recommended control measures can be applied to any other conflict or set of conflicts.

Next, the process of isolating the conflicts in time, i.e., self-consciously choosing rather arbitrary beginning and end points, leads to several unfortunate consequences. The most important of these is the focusing of almost all the attention on the hostilities phase of the authors' model. Even the narratives of the events emphasize the military aspects of the conflicts, as does, of course, the section on weapons. There would perhaps be no harm in this if the authors' purpose were to offer a strategy for *winning* small wars, but their avowed goal is to suggest ways of preventing or controlling such conflicts. Consequently there exists a conceptual gap between the narrative and the list of relevant factors and control measures in each case, since the factors, and especially the measures, refer most often to non-military, long-range problems and solutions which could not possibly be handled within the time period of the conflict.

Perhaps the major methodological difficulty one has with this book, for it goes to the heart of the approach, concerns the definition and identification of "factors" and "measures." A factor is defined as a condition, perception or event that generates pressure either toward or away from violence. (p. 13) Control measures are actions that offset the first type of factor and reinforce the second (p. 30). With definitions as loose as these it becomes very hard to classify the factors or the measures and so, even though the authors have set

up some rudimentary categories of factors (e.g. degree of commitment, autonomy of action, internal cohesion, etc., pp. 25-28) and of measures (e.g. international organization, external-political, military and strategic, etc., p. 36), they do not make any serious attempt to apply these to the individual cases. The result is that factors vary so greatly and seem so arbitrarily classified that it is at times difficult to tell whether a particular factor tends to increase or decrease hostilities—the author's primary concern. When measures are then selected, their number "limited only by the imagination of the authors" (p. 30), to correspond to each factor, the confusion is simply compounded. Space will not permit an extensive sampling of specific factors and measures but the following might convey the kind of difficulties encountered:

Among the factors tending to promote the outbreak of hostilities in the Soviet-Iranian Conflict the authors list the tribal divisions in Iran, notably in the Soviet-occupied area. The relevant control measure suggested is strengthening Iran internally both politically and militarily. Another factor is the proximity and overwhelming power of the USSR vis-à-vis Iran. The relevant measure: renunciation of the concept of spheres of influence (pp. 76-79). In the case of the Greek Insurgency a hostilities promoting factor is the unchallenged control by ELAS (the insurgent army) of almost all of Greece after the German withdrawal. As appropriate control measure the authors suggest the immediate introduction of a massive counter-force of Greek government, friendly ally, or neutral troops (pp. 150-151). In the Indonesian War of Independence a factor is the hostility of Dutch internees and prisoners of war toward the Indonesian Republic, and the control measure is isolating them and denying them access to arms.

While an attempt is made to summarize and generalize the proposed control measures for each case, it remains evident that the variations in level of generality, the prevalence of contradictory and self-defeating measures, and the disconnected nature of the analysis make this a most problematic technique. No wonder then that according to the authors' calculations only 18% of the measures they propose were actually applied.

Finally it should be noted that the book is based on certain ideological assumptions that deserve to be examined. One is the notion that all conflicts in the non-European world involving violence, regardless of whether they are internal or interstate, are undesirable, and should be avoided or at least controlled and halted as soon as possible. Another is the idea that the superpowers, especially the United States, have a major role in this process. The first assumption is certainly not shared by important elements in the developing countries and the second is no longer universally

held, even in the American national security community. I therefore doubt very much that a successful strategy for the 1970's can be forged by following the recommendations of Bloomfield and Leiss. At best they might have served as useful tactics in the 1960's.—P. G. Bock, *City University of New York, Brooklyn College*.

The Roots of American Foreign Policy: An Analysis of Power and Purpose. By GABRIEL KOLKO. (Boston: Beacon Press, 1969. Pp. 166. \$5.95/\$1.95.)

With the publication of this concise volume and the more narrowly focused *Politics of War: The World and United States Foreign Policy, 1943-1945* (New York: Random House, 1969), Professor Kolko joins David Horowitz, Harry Magdoff, J. P. Morray, Robert F. Smith and W. A. Williams as authors of first rate empirically-oriented radical scholarship on U.S. Foreign Policy.

In *The Roots of American Foreign Policy* Kolko evidences little concern for the pluralistic interaction which influences foreign policy decision-making. Thus, the author ignores conflicts over the efficacy or priority of alternative instrumentalities (e.g. allocating limited funds to either leader grants or MAP training). He is similarly disinterested in what I would term non-systemic goals such as whether we should lower tariffs on French automobiles in exchange for a reciprocal reduction for American computers. For political scientists who regard decisions on these or analogous issues to be the "important" ones, Kolko's work has little to contribute.

He is preoccupied with one assumed post-World War II foreign relations pattern: U.S. opposition to economic nationalism and socialism in the "Third World." Since his primary objective is a causal explanation of this pattern, it may be gratuitous to criticize him for failing to demonstrate that such a pattern of response exists. Impressionistically the reviewer believes that this can be done and has been in a limited way by David Horowitz in his *The Free World Colossus* (New York: Hill & Wang, 1965). But there is no reference to this or similar works in the index or copious notes to each chapter. And the volume under review also lacks even a selected bibliography.

Kolko endeavors to explain America's counter-revolutionary imperative by elaborating upon an unoriginal Marxian thesis: that capitalists in this country desire investment opportunities in underdeveloped areas both for direct profits and in order to secure vital raw materials upon "reasonable" terms (i.e. at the lowest possible price). His exposition is extremely well written and appropriate statements by government and corporate officials are cited along with relevant statistical data. When considered in conjunction with the

systematic quantitative analysis by Harry Magdoff in his recent *Age of Imperialism: The Economics of U.S. Foreign Policy* (New York: Monthly Review Press, 1969), a fairly convincing case can be made for this view. Kolko may be faulted, however, for failing to adequately distinguish the forementioned investor goals from other economic objectives which would not necessitate counterrevolutionary intervention. Unlike Magdoff, he also fails to demonstrate the dependence of the American economic system upon the appropriation of surplus from underdeveloped areas.

How are these investment goals translated into an unquestioned policy consensus? Following the fashion of the past decade, the author assumes that because most policy initiatives have originated in the Executive that preponderant governmental power is also vested in that branch. He then infers a linkage between the career patterns of those who initiate policy and the foreign investment objectives which incur the hostility of nationalists and socialists in Vietnam and throughout the "Third World." After summarizing several studies indicating disproportionate upper class representation among high Executive policy makers, Kolko provides us with the results of his own research on top officials "in the State, Defense, or War, Treasury and Commerce Departments, plus certain relevant executive level agencies." Included were:

234 individuals with all their positions in government during 1944-60, comprising the lesser posts if an individual attained the highest executive level. As a total, these key leaders held 678 posts and nearly all of them were high level and policy-making.

In the aggregate, men who came from big business, investment, and law held 59.6 percent of the posts, with only forty-five of them filling 32.4 percent of all posts.

According to the author, this pattern of elite recruitment has remained stable since the New Deal era. As for officials from more humble origins, Kolko suggests that cooptation and exclusion operate to maintain consensus.

Should high status, rich men ever seek to make decisions dysfunctional to the more permanent interests of dominant power interests, even more powerful leaders would immediately purge them from decision-making roles. The point is that while such men are unlikely to make socially dysfunctional decisions so is anyone else who rises to the top of a structure with predetermined rules and functions.

Even if not initially connected with the corporate sector, career government officials relate in some tangible manner with the private worlds predominantly of big law, big finance, and big business.

In concentrating almost exclusively upon the Executive, the author ignores the veto power of Congress. His analysis would have been strengthened had he examined the dependency of many Congressmen upon the corporate-owning upper

class. And this would have reinforced his conclusion that there is no "military industrial complex." Criticizing C. Wright Mills' view that "the military" are a co-equal constituent of "the power elite," Professor Kolko convincingly documents the civilian origins of "our vital strategic assumptions."

For a variety of reasons including the almost universal dissemination of capitalist and anti-Communist values by the mass media and educational institutions, "public opinion" fails to exert any oppositional influence upon the implementation of major foreign policy imperatives. This consensus, in turn, is ultimately secured through "enforced conformity, as expressed often in this century in the . . . suppression of civil liberties."

The determined pursuit of these investment and expansionist economic goals and an uncritical acceptance of "the domino theory" are held to explain our commitment to stability and our inability to "lose face" in Vietnam for "(f)rom a purely economic viewpoint, the United States cannot maintain its existing vital dominating relationship to much of the Third World unless it can keep poor nations from moving too far toward the Left and the Cuban or Vietnamese path." Vietnam is primarily a "holding the line" buffer or protective zone.

Despite the shortcomings mentioned earlier, the book is well-written, relies upon official sources for much of its documentation, avoids redundancy and is marked by very few over-simplifications. A thought-provoking introductory work for students of American Foreign Policy that would make an excellent companion for such works as John Spanier's *American Foreign Policy Since World War II*.—MILES D. WOLPIN, *Marlboro College*.

Betrayal from Within: Joseph Avenol, Secretary-General of the League of Nations, 1933-1940.
By JAMES BARROS. (New Haven: Yale University Press, 1969. Pp. 285. \$10.00.)

In this volume written under the auspices of the Center of International Studies, Princeton University, James Barros seeks to trace the political machinations of Joseph Avenol, second Secretary-General of the League of Nations. Seven chapters of detailed and copiously documented historical study are followed by a brief essay in which the author reflects upon the political role of the international secretariat.

Barros commences with a review of the subjective forces which carried Avenol to the office of Secretary-General despite the contrary counsel of his predecessor. The succession of Harold B. Butler to the directorship of the International Labor Organization upon the death of Albert Thomas required that a French national succeed Sir Eric Drummond as the League's Secretary-General.

Political accommodations among Britain, France, Germany and Italy resulted in the promotion of M. Avenol from the post of Deputy Secretary-General. But to his position Avenol brought a markedly conservative political orientation, intense anti-communism and a continental outlook, all of which prompted him increasingly to subserve the League to Italian and German policies, and to foresee a post-war Europe dominated by Germany. All of these impeded his capacity to serve the organization and its members objectively. In contrast, he used the power of his office to intrigue with the Italian Government, both directly and through Italian nationals within the Secretariat, on averting and/or reversing League action with respect to the Ethiopian conflict. On occasion he knowingly participated in Italian strategy-formulation, and exhausted procedural devices for reducing Haile Selassie's recourse to the League. He used his personal diplomacy to depoliticize the organization, and to turn its attention wholly to technical matters in order that the German Government might find it an acceptable agent of post-war European functionalism. He willingly acquiesced in the wish of the Vichy Government that he resign his post as a symbol of the diminished importance of the League in the policy of France's pro-fascist regime. He bowed to Japanese pressures to remove from China Dr. Ludwig Rajchman, Director of the Secretariat's Health Section, and generally displayed an anti-Chinese outlook. He attempted to thwart Spanish attempts to demonstrate through the League that Franco's forces were supported by Germany, Italy and Portugal.

Throughout this exposition Barros portrays Avenol as "something of a chameleon," as a man who "lacked political awareness," and who was capable of using his high office for purposes of "eroding the Ethiopian position" in order to serve the interests of Italy. Avenol is presented as a public servant whose personal theorizing and political learnings impelled him to deal in half-truths with vitally interested parties. Toward the end of his service he showed "neurasthenic" signs, frequently losing control of his emotions, fearing kidnapping, suffering episodes of ill temper, and concealing his intentions, even from those closest to him, for reason of distrust.

Professor Barros' book is of high, if somewhat inconsistent, quality. Its greatest strength appears to reside in the extensive use of archival sources which, in many instances, permit the author to substantiate his conclusions by multiple evidence. Yet some segments of his treatment stand out in terms of both clarity and depth. This is especially true of the author's examination of Avenol's handling of the Italo-Ethiopian crisis, owing perhaps to his continuing interest in Mussolini's relations

with the League. (*The Corfu Incident of 1923: Mussolini and the League of Nations*, Princeton, 1965. Reviewed in this *Review*, vol. 60, pp. 455-456) The two chapters devoted to this issue, and the frequent reference to it elsewhere, are characterized by exhaustive research, meticulous documentation, and cautious wedding of conclusions to evidence. On no other issue is Avenol's chicanery portrayed so persuasively.

There appear, however, two major defects in the book. In the author's careful exposure of Avenol's ideological motives, other causal factors in his behavior are often insufficiently revealed. Barros notes, for example, that the Secretary-General's actions were occasionally contrived to prevent the alienation of the Axis powers from the League and, later to avoid eradicating the possibility of enticing those states to resume participation. So, too, does he note that Avenol's diplomacy with the Duce prior to 1939 was founded in part upon the hope of maintaining the Stresa front. Whatever may have been the role of these thoughts in Avenol's over-all behavior is not examined with the scholarly thoroughness given to the study of the Secretary-General's political dispositions. Thus the reader's hope is not entirely fulfilled that Barros might have separated popular perceptions of Avenol's behavior from historically demonstrable fact.

While the book offers no main conclusions, the author spends the final pages examining the "Implications for the Office of Secretary-General." His observations, while continuously relevant to an organizing world, and while realistic with respect to the political restraints upon the international secretariat, are neither profound nor original. It is the reviewer's assessment that this closing essay lends little service to a study which is distinguished in other aspects. It does not, however, diminish the considerable value of Professor Barros's book as historical evidence of the dangers implicit in the presumed political immunity of the international secretariat. Nor does it minimize the author's success in his declared intention of presenting a segmental biography of one of the most controversial actors of the interwar years.—WALTER S. JONES, JR., *Northeastern University*

Present at the Creation: My Years in the State Department. BY DEAN ACHESON. (New York: W. W. Norton & Company, Inc., 1969. Pp. 798. \$12.50.)

In a statesman's memoirs we look for new light on old subjects and new insights into the behavior of the man himself. In these regards former Secretary of State Dean Acheson's latest memoir, *Present at the Creation*, does not disappoint us.

It represents a meticulous reconstruction of the

forces which beat down upon the decision-makers as they sought to find solutions not only to the problems of American security but to the Chinese civil war, the Palestine question, Europe, the Cold War, the atomic bomb, Germany, and Asia. As such it constitutes the most powerful explanation of the "cold war" so far presented by one of those who had to wage it on the American side. It emphasizes the force of events and the limitations of choice dictating American strategy and diplomacy.

No review can do justice to the detail with which Acheson documents the motives of American foreign policy makers, but the thesis which emerges is straightforward and compelling. The world which America confronted at the war's end and for some time afterward was one of appalling dislocation and despair. Most of the assumptions upon which even the realists in the American government had based their thinking quickly proved illusory. Whether the United Nations and other elements of Rooseveltian diplomacy ever had any basis in reality, the inability of Russia and America to get along quickly dispelled any immediate hope in that direction. Under the circumstances the U.S. had to forge a new role in world affairs. Given the choice between doing nothing or risking bad relations with the Russians, Acheson much preferred the latter. Sooner or later it would come to that anyway under circumstances disadvantageous and potentially dangerous to the United States; common sense dictated that it come about under circumstances favorable to the West. In these situations there is no substitute for power; it has both a prophylactic and, in its economic form, a therapeutic value. The other side respects it too. From this premise flowed the Truman Doctrine, the Marshall Plan, NATO, Point IV and the American response to the aggression in Korea.

Revisionists won't agree with Acheson's statement of the case but in order to demonstrate otherwise they will have to show more than economic causation; they will have to show that there were really other major alternatives than those which the statesmen adopted. In the end the worst was averted and despite the explosive potential of the Chinese civil war, the Berlin Blockade and the Korean aggression, war with Russia was carefully avoided leading on to a better day.

A great deal of the narrative is devoted to the details of persuasion and mediation to which anyone who sets out to rebuild a world must submit if the enterprise is to be successful. These details are important both to an understanding of the motives and modus operandi of Acheson's diplomacy as well as that of his opposite numbers. It does no good to criticize Acheson for over-militarizing NATO if we ignore the fact that our allies after the Korean invasion insisted upon an American military built-up in Europe.

In dealing with allies and other third powers the strength of Acheson's non-ideological and essentially strategic view of the world was a powerful asset enabling him to reassure and mobilize them in support of its objectives. The world wanted U.S. succor but it did not want war. Acheson's diplomacy of building "situations of strength" without waging an anti-Communist crusade was very appealing to Europeans who wanted to be defended not "liberated" again.

Only toward the end of the memoir where he describes his efforts to secure adoption of EDC and German rearmament do we sense that his emphasis upon military build-up is overstraining the political possibilities of the situation. It is also apparent that his preoccupation with the European situation may have led him into commitments to the French in Indochina for instance which he sensed were inherently unwise and unproductive.

Where Acheson was convinced that American power was likely to prove efficacious or where the use of military power per se was inappropriate he was perfectly prepared to cut America's losses.

America's retreat from China was the logical culmination of a half century of fumbling, uncertainty, and half-hearted efforts to make China a great power. It was never in the cards and Acheson had the strategic sense to recognize that the revolution sweeping Chiang away was to big to be contained by the U.S.

Much has been made of Acheson's failure to include South Korea within the so-called American defense perimeter in Asia. Whether that invited the attack or not it was clearly the other side that made the decision to aggress. Where the fatal decision is ours we too often pass it off as an unintended consequence. Acheson has the candor to admit that the advance to the Yalu was a misconceived policy and near fatal error of judgment on our part.

Acheson makes clear that having made one mistake he did not intend to compound it by letting MacArthur pull the Administration into a war with Red China. Such a war was neither strategically necessary nor wise politically, and it is to Acheson's credit that he never wavered in his wisdom that such a war would be an unnecessary piece of insanity. Temporizing with the Chinese undoubtedly cost the lives of young Americans, but America at least maintained its equilibrium and the support of its allies.

At home Acheson's strategic and diplomatic policies were the center of raging controversy. The controversy was fed by a two fold psychic crisis: that of the isolationists led by Robert Taft who profoundly and sincerely opposed the course of world-wide involvement on which Truman and Acheson were leading the country. The other center of psychic crisis, the American obsession with

anti-communism, was finally tapped in the spring of 1950 by Senator Joseph McCarthy.

They came together in a convulsive movement of national madness when "Taft, who had first regarded McCarthy as reckless, now decided to give him Republican backing." Acheson accepts the thesis advanced both by Earl Latham in "Communism in Washington" and William S. White, Taft's biographer, that Taft was prompted by the Republican defeat in 1948 to believe that anything "to defeat or discredit the Truman plans was acceptable" up to and including impeachment of the President.

Because of his own stoic acceptance of the vicissitudes of politics and of human nature, especially in its collective manifestations, Acheson does little more than record the more irrational forms which American behavior took during his tenure in office. But can we assume that such forces have *not* over time done more to pervert and misguide American foreign policy than Acheson lets on. International politics is not an inherently humanistic enterprise; therefore all the more reason to be sensitive to the potential for both good and evil of the American colossus. There is no guarantee that foreign policy will always be in the hands of a man as responsible as Dean Acheson.

What overall sense of American policy emerges from Acheson's voluminous and exciting narrative? The impression is that of American power, at first haltingly and then with considerable sweep and assurance, moving onto the world scene.

Under Acheson's stewardship it was less a matter of opposing the Communists, although that was an ingredient, than in giving an order to the non-Communist world shattered by two wars and the collapse of the great empires. It is the steady assertion of national power tempered by a sober awareness that a war that Russia would not do and that the U.S. must not let itself be bogged down in a hopeless war on the Asian mainland that distinguished Acheson's statecraft. Commitments were closely tailored to American economic interest and to a strategic rather than either an idealistic or an anti-Communist view of the world.—DAVID S. McLELLAN, *University of California, Riverside*.

The United Nations Economic and Social Council.

By WALTER R. SHARP. (New York: Columbia University Press, 1969. Pp. 322. \$8.75.)

Peace and prosperity are the major purposes of the United Nations. Since the Charter entered into force, however, more than 100 conflicts have occurred with no end in sight. Perhaps this should not be too surprising. A reading of the recent record of the different organs of the U.N. shows a 1969 Assembly session not seized of such issues as

Vietnam, Nigeria and Czechoslovakia; a Security Council primarily concerned with the adoption of biased Middle Eastern resolutions and composed of members which includes those who sanction, if not encourage, aerial piracy; a Secretariat whose principal officer still maintains that his premature withdrawal of UNEF was the most correct decision he has ever made; and an International Court which delivers judgments and renders advisory opinions which are exercises in futility.

If the maintenance of peace had so far eluded the Organization has the promotion of the economic and social advancement of the peoples of the world fared differently? A fair response necessitates an analysis of the Economic and Social Council, one of the major bodies concerned with the latter objective, and this is the purpose of the study under review. To accomplish his goal, the author engaged in personal interviews and first-hand observations of two sessions of the Council spaced over a period of four years. The resulting ten chapters detail the past and include a number of controversial suggestions for the future.

Occasionally, the book makes tedious reading, due basically to the nature of the materials. Dr. Sharp nonetheless focuses on the issue with keen insight and, at the same time, relates a variety of revealing episodes. To be sure, the strong criticism which he directs at the members of the Council and in particular at their representatives is at first cautiously worded, but this modest approach is soon abandoned. The final chapter notes that ECOSOC is in need of "better men," a deficiency from which other U.N. organs suffer as well. The "so-called" general debate is regarded as a waste of time made worse by the fact that similar propaganda maneuvers occur in several committees, a comment then somewhat modified by describing the discussion as not without "any value"; it has a "certain educational utility"! Yet even on specifics, such as program priorities, no meaningful pattern exists and attempts at program coordination have at times resulted in such interagency rivalry that, as the Water Resources Development Center shows, they have had to be abandoned, although not all of these endeavors have met the same fate was witnessed by the Lower Mekong River Project.

Time and time again, however, Dr. Sharp returns to the thesis that the influx of Afro-Asian states in the early 60s placed the Council in the doldrums and that its enlargement in 1965 staffed it with unqualified and incompetent representatives. Not only are such organs as CPC and the Joint Inspection Unit regarded as inadequate for their tasks, but the most severe indictment is reserved for the decisions to establish UNCTAD, UNIDO and UNCDF which, together with the changing context of Assembly-Council relations,

seriously undermined and eroded the functions of the Council. And while Professor Sharp concludes that the developing countries now consider the Council, which they had previously viewed as an imperialist tool and which they sought to destroy, with more kindness and operational utility for their purposes, 1968 still found ECOSOC uncertain about its revitalization.

Therefore, several substantive and procedural suggestions are set forth, proposals which cannot fail but evoke considerable fruit for thought. Two basic functions are envisaged for the future: first, long range resource allocation and expansion; second, program appraisal and evaluation. These roles call for certain prerequisites which in light of past performances are not, if Dr. Sharp's own presentation is employed as a guide, readily, if indeed at all, attainable. Appointment of a Senior Under-Secretary-General or Deputy-Secretary-General for Development Affairs is the most important procedural change which is advocated. Named by the Secretary-General after consultation with other consultation with other members of ACC and subject to confirmation by ECOSOC, he would chair the Council, especially in terms of managing its procedures in a more expeditious manner, and serve as an overseer of U.S. development policy. Other plans favor a stream-lined agenda, reduction of the volumes of documents, modification of the committee structure of the Assembly and Council, shorter, and more frequent Council sessions, stronger staff support, and a more rational relationship between the Council and the Assembly, including removal from the Council of questions on Human Rights and the Status of Women. Here it might be added that for the last seven years the issue of human rights has formed a separate chapter in the Annual Report of the Secretary-General, but the suggestion overlooks instruments such as the proposed International Covenant on Economic, Social and Cultural Rights which assign specific functions to ECOSOC.

In sum, the book suffers from certain structural defects and several errors of commission and omission. Illustrative of these are the description of the 18th annual meeting as the voteless session of the Assembly, and failure to note that the General Assembly in 1963 approved a provisional measure to enable nine additional members to take part in the work of ECOSOC until the Charter amendment enlarging the Council had come into operation. Also, that the effective participation of the nine in the three sessional committees caused Ambassador Stevenson to testify favorably on the amendment before the Senate Foreign Relations Committee, even though the U.S. delegation had abstained on the Assembly resolution adopting the change. But these negative aspects are minor in

comparison to the book's value. Indeed, Professor Sharp deserves congratulations for presenting such a thorough study of a highly technical subject and for submitting a challenging course of action. Surely, this volume should be read by all interested in the field and should be placed in every course syllabus on international organization. This reviewer has already done so.—GUENTER WEISSBERG, *Colby College*.

Japanese Domestic Politics and Foreign Policy: The Peace Agreement with the Soviet Union.
By DONALD C. HELLMANN. (Berkeley: University of California Press, 1969. Pp. 202. \$5.00.)

The author uses the two-year negotiations (1954–1956) for a peace agreement with the Soviet Union as a case study to illuminate the “crucial features of the new Japanese political system” as they operated in foreign policy decision-making. The approach is avowedly “simplified” and “interpretive,” based upon analysis of the role of public opinion, the political party system, and those formal governmental institutions responsible for the conduct of foreign affairs. Hellmann recognizes that the Soviet negotiations were unique in some respects, but endeavors to show that fundamental features of the political process then emerging were products of “modernized-traditional” phenomena which have significant implications for Japanese and world politics.

The most important contribution of this brief study rests on its detailed analysis of the process of decision-making within the dominant Liberal-Democratic Party. Political maneuvering was characterized by the operation of four types of “modified traditional behavior,” as distinctive features of Japanese politics: personality-centered factions (*habatsu*); a “Confucian” sense of responsibility; consensual authority; and a new type of political leader—the “real power man” (*jitsuryokusha*): “comparatively young, having access to political funds, and openly maneuvering for positions of influence as a leader.”

The major component of this process was the *habatsu*, within which the issues of policy were considered primarily in terms of advancing the party position of the *habatsu* leaders rather than on their own substantive merits. The conclusion is made that this factional conflict is likely to remain as the important determinant in all major foreign policies as long as the LDP remains a strong majority.

Significantly, because of the “closed aspect” of policy-making, no meaningful foreign policy debate ensued between the government, the Diet

and the public. The formal institutions responsible for foreign affairs played only a subordinate role. The author makes a good case for his conclusion that the Japanese public was “poorly informed,” had a “very superficial understanding of the issues,” and consequently played a “rather peripheral role” in the policy-formulation process. Even more significant is his finding that the major business interests, despite their “special channels for access” and position as the “main supporting interest group,” failed to have any great influence on party decision-making. Because of the peculiar relationship existing between these interests and the LDP, it is estimated that business influence “is likely to continue to be limited” on “major Japanese foreign policy decisions.” The author views this closed aspect of decision-making, “largely limited to a party elite,” as a potential threat to the democratic process in Japanese politics:

Unless modification occurs through broadening the channels of communication and access, each major foreign policy decision will become a potential crisis in which not only policy but the viability of the system itself is called into question.

Those concerned with the forthcoming negotiations between Japan and the United States over Okinawa and the Security Treaty might well pay particular heed to the domestic components of Japanese foreign policy formulation. The author presents a useful reminder in the gesture of Secretary of State, John Foster Dulles, during the Soviet negotiations which “ostensibly designed to strengthen Japan’s position . . . became another unsettling element in already confused circumstances.”

The reader is provided with only a brief account of the peace negotiations per se, plus an appendix containing the Joint Declaration signed on 19 October 1956. Most of the research was completed during an eighteen month’s stay in Tokyo, where interviews with party leaders and the Japanese plenipotentiary, Matsumoto Shunichi, plus access to Japanese official documents and periodicals, provided over one-half of the sources utilized for the study. Each chapter is carefully footnoted with interpretive and comparative comment. The extensive bibliography reveals the paucity of material published in English that could be useful for sophisticated political analysis. It is to be hoped that future scholars, grounded in both the culture and language of Japan, will fill this void in American understanding of the leading democratic state in the Far East.—C. LEONARD HOAG, *Middlebury College*.

ANNOUNCEMENTS

The sixty-sixth Annual Meeting of the Association will be held September 8-12, 1970, at the Biltmore Hotel, Los Angeles, California.

1970 ANNUAL MEETING AND SLATE OF OFFICERS FOR 1970-71

The 1970 Annual Meeting of the Association will be held September 8-12 at the Biltmore Hotel, Los Angeles, California.

At the Annual Business Meeting of the Association (the particular session will be announced in *P.S.* for Summer, 1970 and in the Final Program) the Nominating Committee will propose a slate of officers for 1970-71. The Committee is composed of three members appointed by President David Easton: Frederic N. Cleaveland, University of North Carolina; Duncan MacRae, University of Chicago; and Sheldon S. Wolin, University of California, Berkeley; and three members appointed by President Karl W. Deutsch: Professor Hayward R. Alker, Massachusetts Institute of Technology; Professor John C. Wahlke, University of Iowa; and Professor J. David Singer, University of Michigan, Chairman. The Nominating Committee will propose the following officers for 1970-71:

President Elect:	Heinz Eulau, Stanford University
Vice President:	Edward Banfield, Harvard University
	John A. Davis, City University of New York
	David Spitz, Hunter College
Secretary:	Thomas R. Dye, Florida State University
Treasurer:	Donald R. Matthews, Brookings Institution
Council:	Chadwick F. Alger, Northwestern University
	Philip E. Converse, University of Michigan
	Tobe Johnson, Morehouse College
	David Kettler, Purdue University
	Joyce M. Mitchell, University of Oregon
	James W. Prothro, University of North Carolina
	Dankwart A. Rustow, Columbia University
	Gordon Tullock, Virginia Polytechnic Institute

FINAL REPORT OF THE NOMINATING COMMITTEE ON ITS PROCEDURES, CRITERIA, AND RESULTING SLATE FOR 1970-71

1. Establishment of the Committee

Three members (Cleaveland, Wolin, MacRae) were carried over from previous year, and the three new members (Wahlke, Alker, and Singer) were appointed by the President on 15 December 1969.

2. Procedures Prior to Meeting of Committee

The first step was gathering of background information: a) constitutional constraints and precedents; b) prior decisional procedures; c) administrative and budgetary arrangements; d) list of all previous officers since 1959; e) discussion of procedures and general situation with Committee members.

With the background information in, and basic ground rules identified, we began the solicitation of suggestions from the membership of the Association. In addition to the standard announcements in the *Review* and in *P.S.*, we wrote letters asking not only for specific names of potential nominees but for suggestions regarding criteria to be applied in selecting nominees, to each of the following:

Chairmen of Political Science Departments, for dissemination

Former Presidents and Vice Presidents (past decade)

Officers of various ad hoc and caucus groups

Those who had written on matters of governance in *P.S.* since its inception

These letters went out in mid-February, and during the month that followed we received

about forty separate letters of suggestion and about ten telephoned suggestions. Most of the responses merely proposed specific names, but a few also dealt with criteria and procedures.

While awaiting replies to the above inquiries, the Committee members were engaged in more personal solicitations within their several departments, regions, and circles of acquaintances. In addition, we perused back issues of the *Review*, old programs, bibliographies, etc. to compile additional lists of possible candidates.

3. Meeting of the Committee

The face to face meeting of the Committee was scheduled for the weekend of 14–15 March in Denver, and the one member who was definitely unable to attend conferred at length with the Chairman by phone on two occasions prior to the meeting. One other member fell ill just before the meeting, but he was consulted via two phone conversations during the meeting. The four remaining members convened on Saturday morning, worked through the late evening, and met until noon on Sunday.

The meeting was in two distinct parts. The first morning was devoted to a clarification of the background factors, constitutional constraints, precedents, and selection criteria. At that session, we settled on the following criteria. First, it was agreed that the dominant consideration, as in the past, would be that of intellectual excellence—a slate of scholars who would represent the best in our discipline, in terms of creativity, energy, and scientific competence. Second, we recognized the need for people who—charged with the governance of the Association—could be effective and responsible officers, and best serve the membership and the community at large.

At the same time, we realized that other factors might also be important. On matters scientific, we wanted to take cognizance of such differences as the inductive-deductive, normative-empirical, traditional-behavioral, macro-micro, basic-applied, and related issues. And on matters of public policy, we wanted to take account not only of the diverse views within the discipline but of the variety of attitudes toward the Association's role in such matters. Next, there were the emerging caucus and interest groups, and a belief that their several views should find expression in the discipline's decision making bodies. Finally, recognizing that a scholar's outlook and needs may be partially a function of the type, size, location, and mission of the institution in which he works, we thought it wise to seek some balance among such institutions.

While the need for a representative slate of officers was readily accepted, we explicitly rejected any notion of allocating seats or slots to specific groupings or viewpoints. The intention was to offer a list of nominees which would demonstrate our sensitivity to the issues of the moment, represent the best traditions of the discipline, and be able to govern wisely and effectively.

In this preliminary discussion, three issues of a procedural-constitutional issue were taken up, and while the Committee as a whole makes no formal recommendations, its chairman and individual members have communicated informally with the Constitutional Revision and Procedures Committees. These were: the multiple slate idea, the eligibility of Nominating Committee members for nomination, and the implications of a nominee's withdrawal.

Having reached tentative agreements on the above, but recognizing that they would come in for further discussion when we turned to our specific mission, we devoted the balance of the two days to the consideration of specific candidates. Eventually, we arrived—via a combination of majority vote and informal consensus—at agreed choices for all positions and for one or more alternates in the event that any potential nominee declined the invitation. But in accord with our rejection of the principle of standard seats, we developed a complex contingency plan, rather than assigning alternates to specific slots. With this tentative list of candidates and alternates drawn up, we adjourned at noon on Sunday.

4. Post-Meeting Procedures

Following the precedent of previous years, we agreed that the Chairman would contact our choice for President-elect and that the national office staff would initially contact most of the other potential nominees. At the end of one week, a large fraction of the nominees had been contacted, and had accepted our invitation to stand for office.

But given the diversity of views within the Association, the vigor with which they are held, and the consequent possibility of contending slates, not all of our nominees were able to accept immediately. Several of them requested time to consider the matter or to

consult with colleagues, and while we reiterated our position that no faction or group would be permitted to designate its own candidate (or veto those selected by us) we could not object to their consulting with groups of like-minded political scientists. Needless to say the Chairman spent a good many hours in conversation with several of the potential candidates, explaining and justifying the emerging slate, and urging the importance of seeking reform within the framework of the Association. Even though several designees ultimately declined our invitation, these conversations offered an opportunity for the sorts of lively discussion and exchange of viewpoints which are essential to a responsible and democratic governance of the profession.

5. Recommendations

Having weighed all of the above considerations, taken account of the diverse views and affiliations of the membership, and consulted widely within the discipline, we propose the slate of candidates for 1970-71 listed in the boxed announcement on page 678.

NOTICE

RESOLUTIONS AND CONSTITUTIONAL AMENDMENTS AT THE
ANNUAL BUSINESS MEETING

In accordance with the Constitution of the American Political Science Association, the attention of members of the Association is hereby directed to the provisions of the Constitution that:

"All resolutions shall be referred to the Council for its recommendations before submission to the vote of the Association at its Annual Business Meeting." (Article VIII)

Article IX: Amendments

"1. Amendments to this Constitution may be proposed by the Council or by fifty (50) members of the Association. The Council shall transmit all proposed amendments to the next Annual Business Meeting and may make recommendations on those amendments originating outside the Council.

"2. The Council shall have any proposed amendment printed in an official publication of the Association prior to the next Annual Business Meeting. The Council shall then place the proposed amendment on the agenda of that Business Meeting. The Business Meeting may accept or reject the proposed amendment with or without further amendments to it. Within thirty (30) days the Executive Director shall submit amendments supported by at least forty percent of those members present and voting at the Annual Business Meeting to the entire membership for vote by mail ballot. Ballots must be returned within thirty (30) days to be counted. A proposed amendment shall be ratified if approved by a majority of those voting. An amendment shall take effect immediately upon ratification unless the amendment itself provides otherwise."

The Council of the Association will meet during the morning and afternoon of Monday, September 7, and during the morning of Tuesday, September 8. The room will be announced in the Final Program.

The Constitution of the Association, as amended by the 1969 Annual Business Meeting, is printed in the Fall, 1969 issue of *P.S.*, pp. 672-674.

PROGRAM FOR THE 1971 ANNUAL MEETING OF THE
AMERICAN POLITICAL SCIENCE ASSOCIATION

The 67th Annual Meeting of the American Political Science Association will be held at the Conrad Hilton Hotel, Chicago, Illinois, September 7-11, 1971. The Program Committee is listed below. The members of the Committee and the Program Chairman welcome suggestions from members of the profession on specific papers, specific panels, or on the general structure of the program. We would be happy to have ideas for innovation; we would be happy to be reminded of traditions we have slighted. If you have suggestions or comments on the program, please communicate to one more of those listed below. It is important to have these communications early. More definite plans for the meetings will be taking shape in the fall.

Program Chairman: Sidney Verba, Department of Political Science, University of Chicago

I. Research Areas (Note: in designating the research areas, no distinction is made between American politics and comparative politics. Panels will deal with either or both):

- A. Political Belief Systems and their Formation
Denis Sullivan, Department of Government, Dartmouth College
- B. Technology and Politics
Todd La Porte, Department of Political Science, University of California, Berkeley
- C. New Modes of Policy Analysis
Patrick Crecine, Department of Political Science, University of Michigan
- D. Law and Social Change
Herbert Jacob, Department of Political Science, Northwestern University
- E. Conflicts, Groups and Party Alignments
David Kovenock, Department of Political Science, University of North Carolina
- F. Urban Politics
Joel Aberbach, Department of Political Science, University of Michigan
- G. Art as Politics
Claire Rosenfield, Department of English, Brown University
- H. International Relations and Organization
Joseph Nye, Department of Government, Harvard University
- I. Political Development: New Directions
Warren Ilchman, Department of Political Science, University of California, Berkeley
- J. Public Administration: The Administration of Social Services
Paul Puryear, Department of Political Science, Fisk University

II. Philosophy, Theory and Method

- K. Ethical Theory
Richard Flathman, Department of Political Science, University of Chicago
- L. Formal Theory
Gordon Black, Department of Political Science, University of Rochester
- M. Problems of Measurement and Method
Lester Milbrath, Department of Political Science, State University of New York, Buffalo

III. Political Science and Public Policy

- N. The Impact of the Social Sciences on Society: A Retrospect on Recent Major Policy Issues
Graham Allison, Department of Government, Harvard University
- O. The Impact of the Social Sciences on Society: Prospects for the Major Issues of the Future
Murray Edelman, Department of Political Science, University of Wisconsin

IV. Political Science: A Self-Evaluation

- P. Political Science as a Vocation
Merle Kling, Department of Political Science, Washington University, St. Louis
- Q. Teaching Political Science
G. Bingham Powell, Department of Political Science, University of California, Berkeley

Program for the 1971 Annual Meeting of the American Political Science Association

The 67th Annual Meeting of the American Political Science Association will be held in **Chicago** at the Conrad Hilton Hotel, **September 7-11, 1971**. The Program Committee is listed below. The members of the Committee and the Program Chairman welcome suggestions from members of the profession on specific papers, specific panels, or on the general structure of the program. We would be happy to have ideas for innovation; we would be happy to be reminded of tradition we have slighted. If you have suggestions or comments on the program, please communicate to one or more of those listed below. It is important to have these communications early. More definite plans for the meetings will be taking shape in the fall.

Program Chairman: **Sidney Verba**
Department of Political Science,
University of Chicago

I. Research Areas (No distinction is made between American politics and Comparative politics. Panels will deal with either or both.)

- A. Political Belief Systems and their Formation
Dennis Sullivan, Department of Government, Dartmouth College
- B. Technology and Politics
Todd La Porte, Department of Political Science, University of California, Berkeley
- C. New Modes of Policy Analysis
Patrick Crecine, Department of Political Science, University of Michigan
- D. Law and Social Change
Herbert Jacob, Department of Political Science, Northwestern University
- E. Conflicts, Groups and Party Alignments
David Kovenock, Department of Political Science, University of North Carolina
- F. Urban Politics
Joel D. Aberbach, Department of Political Science, University of Michigan

- G. Art as Politics
Claire Rosenfield, Department of English, Brown University
- H. International Relations and Organization
Joseph S. Nye, Jr., Department of Government, Harvard University
- I. Political Development: New Directions
Warren F. Ilchman, Department of Political Science, University of California, Berkeley
- J. Public Administration: The Administration of Social Services
Paul L. Puryear, Department of Political Science, Fisk University

II. Philosophy, Theory and Method

- K. Ethical Theory
Richard E. Flathman, Department of Political Science, University of Chicago
- L. Formal Theory
Gordon S. Black, Department of Political Science, University of Rochester
- M. Problems of Measurement and Method
Lester Milbrath, Department of Political Science, State University of New York, Buffalo

III. Political Science and Public Policy

- N. The Impact of the Social Sciences on Society: A Retrospect on Recent Major Policy Issues
Graham Allison, Department of Government, Harvard University
- O. The Impact of the Social Sciences on Society: Prospects for the Major Issues of the Future
Murray Edelman, Department of Political Science, University of Wisconsin

IV. Political Science: A Self-Evaluation

- P. Political Science as a Vocation
Merle Kling, Department of Political Science, Washington University, St. Louis
- Q. Teaching Political Science
G. Bingham Powell, Department of Political Science, University of California, Berkeley

ADDRESS FOR NEW MANUSCRIPTS AFTER JUNE 1, 1970

Beginning June 1, 1970, the REVIEW's Managing Editor Elect, Professor Nelson W. Polsby, will assume all responsibility for referring and making decisions on all newly submitted manuscripts and for deciding on manuscripts referred but not decided on prior to June 1. Accordingly, after June 1, 1970 all new manuscripts and all correspondence concerning manuscripts not then decided upon should be sent to:

Professor Nelson W. Polsby, Managing Editor Elect
American Political Science Review
Department of Political Science
University of California, Berkeley
Berkeley, California 94720

Each manuscript should be accompanied by an abstract of up to 200 words briefly describing the article's contents. All manuscripts and abstracts should be submitted IN DUPLICATE. They should be double-spaced and may be in typed, mimeographed, hectographed, or other legible form. Footnotes should appear at the end of the manuscript, not at the bottom of the page.

Since manuscripts are sent out anonymously for editorial evaluation, the author's name and affiliations should appear only on a separate covering page. All footnotes identifying the author should also appear on a separate page.

GROUP FLIGHTS TO LOS ANGELES

for 1970 APSA Annual Meeting

September 8-12

The association has arranged group flights from several cities to Los Angeles for the APSA Annual Meeting, September 8-12, 1970. The group fares are the same as excursion fares, but the regulations will permit individuals to return any day of the week and in less than seven days.

The fares for these flights are based on a minimum of 25 participants on regularly scheduled airlines:

New York-Los Angeles	September 7 (Evening)	\$238.35
New York-Los Angeles	September 8 (Morning)	\$238.35
Boston-Los Angeles	September 8	\$248.85
Washington-Los Angeles	September 8	\$226.80
Chicago-Los Angeles	September 8	\$170.55
Atlanta-Los Angeles	September 8	\$193.20
Seattle-Los Angeles	September 8	\$109.20

Each group is required to depart together, but passengers may return individually according to their own wishes. The only requirement is that they reserve a direct flight back on the same airline. These flights are open only to members of the Association and their immediate families. For more information and application forms, write to:

Director, Group Flights to Los Angeles

1527 New Hampshire Avenue, N.W.

Washington, D.C. 20036

Professional Placement Service at 1970 Annual Meeting (September 8-12, 1970)

A Professional Placement Service will be available to members of the American Political Science Association attending the Los Angeles meeting. The service will be located in the Galleria Room of the Biltmore Hotel.

Although sponsored by APSA, this Service is entirely separate from APSA's Personnel Service and therefore requires separate registration.

A file of applicants seeking employment will be available for review by employers and descriptions of position openings will be made available to applicants. Adequate facilities for personal interviews will be provided.

If you plan to attend the Conference and utilize the Placement Service, please complete and mail the form below as soon as possible *but no later than August 3, 1970*. Applicant and/or employer order forms will be forwarded to you upon receipt of your request.

Both employers and applicants can register during the meeting but those filing in advance will receive expedited service. Pre-Convention registration is strongly recommended.

Washington, D.C. 20036

APSA FLIGHT TO INTERNATIONAL POLITICAL SCIENCE ASSOCIATION

8th World Congress, August 31 to September 5th, 1970

Munich, Germany

Members of the American Political Science Association are invited to participate in a group flight to Munich, Germany leaving JFK International Airport in New York August 22 and returning September 7, 1970. The fare will be \$245.00 on Lufthansa German Airlines.

Persons wishing to make reservations now may write directly to the Association, in care of the Director, Summer Flight Programs, 1527 New Hampshire Avenue, N. W., Washington, D.C. 20036.

APSA TEMPORARY AND SUMMER SCHOOL FACULTY EXCHANGE

The Association has initiated a program to act as exchange between institutions seeking temporary and summer school faculty and political scientists seeking positions. APSA welcomes notification from employers with short-term needs, and from members of the profession interested in such appointments.

Please contact:

The APSA Temporary and Summer School Faculty Exchange
American Political Science Association
1527 New Hampshire Avenue, N.W.
Washington, D.C. 20036

THE AMERICAN POLITICAL SCIENCE ASSOCIATION'S

Personnel Service . . .

The American Political Science Association's Personnel Service operates as a "clearing house," bringing together political scientists seeking positions and prospective employers. Registration in the service, at a \$6 per academic year fee, is open to all members of the Association. Here are the details of its operation:

Position Openings

- A Newsletter is mailed monthly to those Association members seeking positions through the Personnel Service. There are presently over 1,000 members in the Personnel Service.
- The Newsletter lists, by code number, position openings and job descriptions.

Employers Using the Service

- Any employer may use the Association's Personnel Service.
- Types of positions listed include teaching on the university level, administrative positions with professional organizations, research and administrative positions with federal, state and local government agencies.
- There is no cost to the advertising institution.

For further information concerning registration write to:

Director, Personnel Service
The American Political Science Association
1527 New Hampshire Avenue, N. W., Washington, D. C. 20036

Registry of Retired Professors

The Association has established a Registry of Retired Professors. The Registry serves as an information exchange for those retired professors who are willing to teach one or more courses on a one-semester or one-year basis, and those institutions desiring to make such appointments. Any retired professor wishing to be listed in the Registry should contact the Association to receive an application form. Departmental chairmen wishing to inquire about the availability of retired professors in a certain specialty or geographic area should write specifying their requirements.

The Price of Dependency

Civil Liberties in the Welfare State
by Robert M. O'Neil

Does government control through conditioned benefits make us all second class citizens? This searching and important new book zeros in on what happens to the constitutional rights of minority groups, government employees, welfare recipients, college students, public housing tenants, and millions of other Americans who receive some form of government aid. It also offers constructive recommendations. "One of the few really important books on civil liberties that has appeared in recent years."

—ARYEH NEIER, Executive Director of the New York
Civil Liberties Union

Paperbacks from Praeger

GERMAN CONSTITUTIONAL DOCUMENTS SINCE 1871

Selected Texts and Commentary

Edited by Louise W. Holborn,
Gwendolen M. Carter, and John H. Herz

Useful both as a basic sourcebook and as a text, this volume offers a synoptical comparison of the basic institutional elements of the German political system as these have appeared in each of the regimes that have existed since the creation of modern Germany. Included are the constitutions of the Empire, Weimar, and the Federal Republic, as well as pertinent documents relating to West Berlin and also basic Nazi statutes. Of major importance is the inclusion of the full text of the new GDR constitution as well as the 1968 Emergency Law of the FRG. Fall 251 pp. \$10.00, cloth; \$3.95, paper.

THE LATIN AMERICANS

Victor Alba

"Alba's new book . . . is the best introduction to Latin America now available. He has a feel for the area based on the decades he has lived and travelled in all parts of the continent. His understanding of the area enables him to describe how the geography, population and culture, as affected by outside forces, combine to create the modern Latin America. This book will be useful both as a text and as a reference book."—Harry Kantor, Marquette University. 416 pp. \$10.00, cloth; \$3.95, paper.

BLACK REVOLUTIONARY

George Padmore's Path from
Communism to Pan-Africanism

James R. Hooker

"At last a full-length biography of Padmore, one of the 'fathers' of Pan-Africanism, is available . . . A must for students of the history of Pan-Africanism."—*Choice*. "An important contribution to Africana from a first-rate scholar."—*Library Journal*. "Of great interest and value to students of African political developments."—*The Times Literary Supplement* (London). 108 pp. \$6.50, cloth; \$2.25, paper.

A SHORT HISTORY OF SOCIALISM

George Lichtheim

This brilliant introductory survey of socialist thought and politics from the French Revolution to the present offers penetrating analyses of the contributions to socialism made by such figures as Owen, Proudhon, Saint-Simon, and Marx. The author illuminates the distinctions between, and relations among various schools within the socialist movement. "Readable and well-documented"—*Library Journal*. 376 pp. \$8.95, cloth; \$3.95, paper.

INSIDE THE SYSTEM

A Washington Monthly Reader

Edited by Charles Peters and
Timothy J. Adams

Introduction by Richard H. Rovere

"The American system is in trouble. It's not responding well enough or fast enough to our critical national problems." That statement, from the editors of *The Washington Monthly*, sums up the theme of this book, which brings together a striking selection of articles from the new national magazine's first twelve issues. The work of a talented group of journalists and politicians, the book collectively reveals the shortcomings of the federal government. August ca. 304 pp. ca. \$7.95, cloth; ca. \$2.95, paper.

COMMUNITY CONTROL AND THE URBAN SCHOOL

Mario Fantini, Marilyn Gittell, and
Richard Magat

Introduction by Kenneth B. Clark

This is a comprehensive study of the participation issue in urban public schools. Tracing the development of public education and the bureaucratization of school systems since the 1900's, the authors examine where and for whom the attempt to provide universal education failed. They offer a persuasive case for community control as a means of achieving the participation they consider to be an intrinsic part of the education process. July 288 pp. \$7.95, cloth; \$2.95, paper.

Three books from the new series

UNITED STATES INTERESTS IN THE MIDDLE EAST

JERUSALEM: KEYSTONE OF AN ARAB-ISRAELI SETTLEMENT

by Richard H. Pfaff

Suggests seven policy choices for the United States, and analyzes each choice. Discusses religious significance of Jerusalem to Christians, Jews and Moslems, and points out vast cultural gulf between Old City residents and Western-oriented Israelis. (August 1969) price \$2

DOCUMENTS ON THE MIDDLE EAST

edited by Ralph H. Magnus

Collection of documents that explain the development of United States policies in the Middle East. In addition to official documents, includes official explanations, speeches and letters essential to basic discussions. (July 1969) price \$3

UNITED STATES INTERESTS IN THE MIDDLE EAST

edited by George Lenczowski

A unique examination of the political, economic, and cultural components of American interests in the Middle East. Contributors to this special analysis, in addition to George Lenczowski, professor at the University of California, Berkeley, are Ralph Magnus, also of the Berkeley campus, Professor Carl Leiden, University of Texas, and Professor Abdul A. Said, American University. Consultants were Professors H. Paul Castleberry, Washington State University; Howard Ellis, University of California, Berkeley; Hamdy Loutfi, McGill University, Montreal, and Malcolm Kerr, University of California, Los Angeles. (October 1968) price \$3

This series is the outgrowth of A.E.I.'s Middle East Research Project to examine some of the questions raised by the deterioration of the United States position in the Middle East. The project director is George Lenczowski, Middle East expert at the University of California, Berkeley.

SKIP THIS PAGE

. . . if you're not interested in love, hate, war, crime, violence, protest, revolution, death, and other aspects of contemporary life.

We are interested and we're trying to do something about it. We're publishing Trans-action books, a series of inexpensive paperbacks that can help you and your students get down to the real facts about serious problems that beset us today. Frankly, we're tired of the stuff we read, see, and hear about these problems and we are putting out a set of books by some of the most thoughtful, well informed and devoted students of political and social behavior that get beyond the surface of these issues to provide a basis in fact for understanding and correcting them.

America and the Asian Revolutions, edited by Robert Lifton, for example, focuses squarely on the explosive potential of Southeast Asia that has only been partially tapped by our adventurism, with possibly more disasterous consequences awaiting our further intrusion. Peace and the War Industry, edited by Kenneth Boulding, on the other hand, takes a look at what's happening back in the States. It evaluates war and the preparation for war as only one of several alternatives for resolving differences between nations and considers whether it persists because it is an economic necessity built into a "military-industrial complex."

You may also be interested in Police Encounters, edited by Michael Lipsky, the first of several volumes on law enforcement agencies as intermediaries between law-breakers and the law-abiding. This book covers black revolts, police riots, police brutality, sniping, gangs, crime statistics, and the efficacy of violence as a means of enforcing order.

And then there's bureaucracy! And, like it or not, modern man is man in bureaucracy. He spends the majority of his waking hours establishing an identity and status therein, garnering most of his satisfaction therefrom, and, increasingly, being what he does. American Bureaucracy, edited by Warren Bennis, pinpoints the dilemma of bureaucratic organizations, discusses the specific human needs that must be met if bureaucracies are to attract and retain talented people, and the kinds of organizations that may be expected to evolve in the future.

Trans-action books constitute the first paperback series dedicated not merely to highlighting social problems but to establishing guidelines for social solutions based on social science. We hope you will look for them at your local bookseller, or write us for complete information or sample copies.

Also, if you haven't seen them yet, write for copies of Great Issues of International Politics, edited by Morton Kaplan (Professor of Political Science at The University of Chicago); Political Leadership in Eastern Europe and the Soviet Union edited by R. Barry Farrell (Professor of Political Science and Director of the Comparative Politics Program at Northwestern University); and The Structure of Political Geography edited by Roger Kasperson (Assistant Professor of Government and Geography, Clark University) and Julian Minghi (Associate Professor of Geography, University of British Columbia. Aldine Publishing Company—529 South Wabash Ave.—Chicago, Ill. 60605

DETENTE DIPLOMACY: UNITED STATES AND EUROPEAN SECURITY IN THE 1970's

by Timothy W. Stanley and Darnell M. Whitt, both of The Johns Hopkins University
School of Advanced International Studies and The Washington Center of Foreign
Policy Research

Foreword by Livingston T. Merchant

Published for The Atlantic Council of the United States

"A challenging analysis of the main problems which confront us in the European
area. An important, constructive book."

Senator Henry M. Jackson

"A very useful and timely study of the European scene. The various factors which
will influence developments on the continent are effectively analyzed and the
dangers and opportunities of the European situation are well presented."

Hon. Charles E. Bohlen

"In this important book, which focuses serious attention on the current SALT and
NATO negotiations, Stanley and Whitt manage to give you the concepts in depth
yet be as topical as the newspaper you read at breakfast this morning."

The Wish to Be Free*Society, Psyche, and Value Change*

Fred Weinstein and Gerald M. Platt

The Wish to Be Free is an important interpretation of modern revolutionary change. Focusing on personality, ideology, and social structure in psychoanalytic and sociological terms, the book links the French Enlightenment to Freud, political change to change in the family. By defining the changing pattern of father-son relationships in terms parallel to changing relationships to authority in politics, the authors have added an entirely novel dimension to discussions of revolutionary change, and have tied the present to the past in a highly instructive way.

"Significant and original. Among the very best attempts to integrate psychoanalytic theory with sociology and history."—*Talcott Parsons*

Employment Grievances and Disputes Procedures in Britain

K. W. Wedderburn and P. L. Davies

A comprehensive description of the formal and informal procedures for resolving grievances and trade disputes in Great Britain. This volume examines the general structure of British labor law; the voluntary procedures established by collective agreements; the legal machinery for arbitration and for state intervention; and the operation of the new Industrial Tribunals which since 1965 have had jurisdiction over certain types of employment questions. The book also assesses the recommendations and advice put to the British Government by the Royal Commission Report on Trade Unions and Employers' Associations in June 1968.

1969 LC: 71-84788 300 pages \$10.50

Revised Edition

The Millennial Kingdom of the Franciscans in the New World

John Leddy Phelan

Regarded as a major contribution to the history of the Spanish Conquest, this book studies the writings of Gerónimo de Mendieta (1525-1604), the principal proponent of the Franciscans' belief that the use of force was justified in conquering the infidels. Professor Phelan examines both the theological basis for Mendieta's position and the ways in which the events of the Conquest influenced his thinking.

1969 176 pages \$6.75

POWER IN ORGANIZATIONS

Edited by **MAYER N. ZALD**

Power, both as it is exercised *within* organizations—for control, for decision-making, for effecting or inhibiting change—and as it is created *by* organizations, is the subject of these papers and commentaries presented at the First Annual Vanderbilt Sociology Conference in March 1969. The sociologists, political scientists, and public- and business-administration professionals represented examine different aspects of power in various settings, from manufacturing firms to a major medical school-hospital complex. Theoretical studies are also included.

\$10.00

SEEKING WORLD ORDER

The United States and International Organization to 1920

By **WARREN F. KUEHL**

An account of more than a century of effort in the United States to achieve an international organization. The author has focused on the work of the many dedicated American internationalists who wrote, lectured, organized, and lobbied for the cause, and, from this perspective, he presents a revisionist interpretation of Woodrow Wilson's role in the fight for the League of Nations. "More detailed and comprehensive in dealing with the historical roots of the peace movement than any other work now in existence."

—Professor Ruhl J. Bartlett

LEGITIMACY AND STABILITY IN LATIN AMERICA

A Case Study of Chilean Politics
by **Francisco José Moreno**

An original evaluation of Chilean politics, this work challenges the prevailing view that Chile's stability is the result of pluralistic democratization. Instead, it asserts that the Chilean political system has been legitimized on the basis of its appeal to traditional monistic tendencies and veneration of charismatic leadership.

224 pages

THE REPUBLIC OF IRELAND

Its Government and Politics
by **Morley Ayeart**

From the Anglo-Irish wars of the 16th and 17th centuries to the "Troubles" of 1919-1921 and to the present, this is an up-to-date, unbiased account of Irish politics. Providing historical background, it concentrates on the political system and Constitution and their relation to the Irish community since the Treaty of 1921.

NON-WHITE IMMIGRATION AND THE "WHITE AUSTRALIA" POLICY

by **Herbert I. London**

Reflecting an increasing concern with her image as an Asian state, Australia in 1966 proposed "dramatic changes" to liberalize her non-Caucasian immigration policy. This thoroughly researched book is the first historically and sociologically comprehensive overview of changing attitudes and resultant policies.

Change in Communist Systems

Edited by Chalmers Johnson. How and why do Communist systems change? Twelve of the world's leading specialists on Communism have set out to analyze the problems of social, political, and economic change in the 14 existent Communist systems using contemporary models of social science theory, in particular the "mobilization system" model. \$8.95

Political Terror in Communist Systems

Alexander Dallin and George W. Breslauer. This study has five main aims: to assess the place of political terror in Communist systems, to identify the range of functions assigned to terror by Communist regimes, to explore variations among Communist states in the use of terror, to find functional equivalents, and to relate terror to some broader hypotheses regarding the dynamics of developing political systems. July. \$5.95

The Politics of Brazilian Development, 1930-1954

John D. Wirth. This book increases our understanding of Brazilian politics during the era of Getúlio Vargas by presenting detailed case studies of three key economic issues of the time: the foreign trade policy of the 1930's, the decision to build the Volta Redonda steelworks, and the birth of Petrobrás, Brazil's state oil monopoly. \$7.95

Karl Radek

THE LAST INTERNATIONALIST

Warren Lerner. This is the first full-scale study in any language of Radek's political career, from his youth in Polish socialism through his years in the old German Social Democratic Party and his recruitment into Bolshevism after the first Russian Revolution in 1917. Illustrated. \$7.95

STANFORD UNIVERSITY PRESS

Human Rights and International Action

THE CASE OF FREEDOM OF ASSOCIATION

Ernst B. Haas. This study argues that despite debates, resolutions, and treaties, the effort to protect human rights by international means has failed. To test this hypothesis, the author examines some 500 freedom-of-association cases mediated by the International Labor Organization between 1950 and 1968. \$6.50

Alexander Hamilton and the Idea of Republican Government

Gerald Stourzh. The political ideas of Alexander Hamilton, particularly his ideas concerning republican government and the form it should take in America, are analyzed and placed in the context of the thinking of the Founding Fathers between 1760 and 1800. The work stresses the influence on his political views of Renaissance and British constitutional thought. \$8.50

The Transformation of Political Culture in Cuba

Richard R. Fagen. "Succeeds in giving us a fuller view than ever before of the nature of the revolutionary process. . . . In its vivid picture of a society determined to change itself, in its plausible and cautious conclusions, and in its comparative approach, this is a major contribution."—*Library Journal*. *Stanford Studies in Comparative Politics*. Illustrated. \$8.50

Georges Mandel and the Third Republic

John M. Sherwood. A determined, ambitious, and extremely able player of the game of parliamentary politics, Mandel was one of the leading political figures of the Third French Republic. This study traces his career from its beginning as chief assistant to Clemenceau to his imprisonment and assassination in 1944.

**AGRARIAN PROBLEMS AND PEASANT
MOVEMENTS IN LATIN AMERICA**

Edited by Rodolfo Stavenhagen. With land reform a vital Latin American political issue, this original anthology provides a balanced view of agrarian structure, the traditional dynamics of rural peasant society, and the role of that society in potential reform. *An Anchor Original.* To be published in August. \$2.45

THE LAST LANDSCAPE

William H. Whyte. In this important and hopeful book on the American metropolitan problem, the author of *The Organization Man* shows how our cities and suburbs can be better places to live in—because more people will be living in them. Illustrated. \$1.95

MOVEMENT AND REVOLUTION

Peter L. Berger and Richard J. Neuhaus. A conservative and a radical, one outside, one inside the Movement, examine the implications of what is happening in America today, agree on the necessity for immediate, far-reaching changes in American life, and debate the means by which these can be achieved. Hardbound, \$5.95; Anchor paperbound, \$1.45.

NOBODY WANTED WAR

Second Edition, Revised

Ralph K. White. Since its original publication more than a year ago, events in Vietnam have borne out this broad forecast by the social psychologist whom Senator Fulbright calls "one of the most perceptive observers of the Vietnam War." Professor White examines the complex of misperceptions which have caused war in general—and Vietnam in particular. \$1.95

English and American Judges as Lawmakers

By LOUIS L. JAFFE, *Harvard University*. This book deals with the law-making function of judges in a democracy. It contrasts English and American judges, explores the bold innovations of the American courts and propounds justification for that activity related to democratic theory, while pointing out its dangers. The author criticizes the English judges for their restrictive notions of the judicial functions and their rejection of the great examples set by Coke, Mansfield, and the nineteenth-century judges. \$3.50

The Concept of a Legal System:

AN INTRODUCTION TO THE THEORY OF LEGAL SYSTEM

By JOSEPH RAZ, *The Hebrew University, Jerusalem*. Three problems are explored in this study: what does it mean to assert or deny the existence of a legal system? How can one determine whether a given law belongs to a certain legal system? Is there a structure common to all legal systems, or the certain types of legal systems? The examination of these problems leads to a new approach to some traditional jurisprudential questions, though the conclusions reached are based on a critical appraisal of several previous theories. 7 text figures. \$6.25

The Popular Movement for Law Reform, 1640-1660

By DONALD VEALL. The law and the legal system came under severe criticism during the period from 1640 to 1660. The author here studies the movement for reform that followed. He traces its development, analyzes the different schools of thought among the reformers, and discusses the various proposals for reform of the criminal law and procedure, the prisons, the courts, the lawyers, and the land law. \$8.50

Yugoslav Civil Law:

HISTORY, FAMILY, PROPERTY

By A. G. CHLOROS, *King's College, London*. This is a firsthand account of the Yugoslavian legal system. The author spent several months in Yugoslav law. Its history, which is largely unknown in the West, is traced from the earliest times to the present. Family law and the law of property are studied against the background of history, official doctrine and the practice of the courts. Ideas which Yugoslavia helped to popularize, such as social property and workers' self-management, are discussed. 2 maps. \$7.75

News from 17 Dunster Street

At last we can tell you more about our first political science volume—a significant book from the Institute of Politics at the Kennedy School of Government, Harvard University—to be published in August.

The State and the Poor

Edited by Samuel H. Beer and Richard H. Barringer,
both of Harvard University

A proposal for a more constructive role for state government in alleviating poverty: This new book explains **what** the state is doing for the poor, **how** it is doing it, and what it **might** be doing. Eleven functionally-oriented pieces by respected authorities from Boston College, Brandeis, Harvard, and M.I.T. offer specific recommendations in the areas of manpower, welfare, transportation, housing, health care, education, state planning, and fiscal policy. The focus throughout is on responsiveness to the needs of the poor in policy planning and operation at the state level. An indispensable reference for public officials, students, professors, and concerned laymen.

August 1970, approx. 320 pages, paper \$4.50

The American Enlisted Man—*The Rank and File in Today's Military*

CHARLES C. MOSKOS, JR.

Who is the man behind the gun? In an effort to find out, the author, a sociologist and journalist, interviewed soldiers in Germany, Korea, the Dominican Republic, and, especially, in Vietnam. From these interviews and from his own participation and observations, Dr. Moskos has constructed a fascinating, highly readable account of the norms, attitudes, and styles of life in the "enlisted culture."

\$7.95

On Record—*Files and Dossiers in American Life*

STANTON WHEELER, Editor

American society keeps a vast collection of records on its members. Who determines what records are kept? Who has access to the records? To what extent do records follow an individual after he has left the setting in which they were gathered? What are some of the dangers and pitfalls in record-keeping? *On Record*, with contributions from a number of leading social scientists, provides descriptive accounts of record-keeping in a variety of important public and private organizations.

\$12.50

The Politics of Corruption—*Organized Crime in an American City*

JOHN A. GARDINER

What are the consequences of long-term corruption for the governance of cities already suffering from a host of other social ills? One official in the Justice Department answered thus: "The rackets destroy a city. People's confidence has been destroyed—that's what leads to riots."

In this classic "Wincanton" study, the author shows how City Hall and the syndicate actually work together and how the attitudes of the law-abiding citizenry allow corruption to flourish.

NOW IN ENGLISH

LOS QUE MANDAN

By José Luis de Imaz

Translated by Carlos A. Astiz

A pioneering analysis of the "power elite" in Argentina's political life, from 1936-61, as determined by political parties and their leaders, the military establishment, the Roman Catholic church hierarchy, business and industrial leaders. The English translation brings these data up to date and Professor Astiz's introduction places the study in context for those who are not familiar with Argentine history and politics.

Dimensions of Freedom: An Analysis

Felix E. Oppenheim

A study that extends the behavioral analysis of power by applying it to the concept of freedom, providing a framework within which discussion of the value and importance of freedom can be carried on without ambiguity.

"Everyone who values political theory as a serious and worthwhile enterprise will profit from this book. It is a unique and highly successful effort to give precise empirical meaning to such key notions as freedom, control and power. Oppenheim thus helps to close the unfortunate gap that has grown up between modern social science and traditional modes of thought among political scientists."
—Robert A. Dahl

"[Oppenheim's] results as well as the philosophical implications he outlines should prove illuminating and suggestive to social and political theorists as well as to methodologists and philosophers: among all of them, the book will no doubt stimulate productive discussion."
—Carl G. Hempel

"... enormously stimulating and veritably creative . . . far ahead of existing works of the kind. . . ."
—Harold Lasswell

Theories of Peace and Security

Readings in Contemporary Strategic Thought

John Garnett, editor

This collection analyzes the role of military force in international politics, providing a synthesis and critique of the most important contemporary theories about the use of force in promoting a peaceful and secure world. The introduction surveys the best recent thinking on the subject, both British and American. The essays and articles—some from specialized literature often inaccessible to students—reflect the trends in research and the flavor of contemporary thinking. The major divisions of the book cover such key issues as deterrence, disarmament, arms control, and limited war. The contributors include some of the most eminent thinkers in the field, and many of the articles are already classics.
256 pages cloth, \$7.50 paper, \$2.50

The New International Actors

The United Nations and the European Economic Community

Carol Ann Cosgrove and Kenneth J. Twitchett, editors

A collection of twelve of the best studies on the United Nations and the European Economic Community, reprinted here for the first time. This volume is one of the few to discuss the U.N. and the E.E.C. together, showing the extent to which they, as major international institutions, play significant roles in international affairs. The editors have contributed a comprehensive introduction that draws together much recent theoretical and factual material and sets out a series of tests designed to identify the qualities that allow international institutions to be actors in international affairs, having an impact that differs from, but can be as significant as, that of sovereign states.

Now! Reduce Search Time with the **PRINCETON INFORMATION TECHNOLOGY UNIVERSAL REFERENCE SYSTEM**

POLITICAL SCIENCE SERIES

General Editor: Alfred de Grazia,
Professor of Government, New York University

As a ten-volume bibliography with supplements covering more than 30,000 significant works of particular interest to political scientists and those in related social science disciplines, the *Universal Reference System Political Science Series* represents a widely-accepted, major innovation in bibliographic research. The series enables students, professors, and research workers to rapidly review, in considerable depth, the work issued by some 2400 publishers and 800 journals, foreign and domestic; and brings the searcher's attention to more relevant works than would be located in any other type of search. In order to ensure dissemination of the most recent information, the series is updated with annual supplements, extending its coverage into the 1970's.

The series has two unique qualities:

- 1) comprehensive coverage and detailed inspection
- 2) rapidity of bibliographic research

Basically, each URS volume consists of a Catalog of Documents that contains traditional citations and annotations, and an Index of Documents. The Index provides the system with its "search power."

All publications included in the series are carefully selected by experts in the field of political science. Each publication is then assigned up to 21 descriptors, chosen from thousands denoting various topics and methodologies on several conceptual levels. In the Index of Documents, each descriptor is listed including all works assigned that particular descriptor. A computer sorts and arranges this data, for each of the ten political science subdivisions, into an alphabetized index and a catalog arranged alphabetically by author.

Each citation or reference presents a clear, concise summary of the document, covering the topic, scope, and methodology of the work, as well as the conclusions reached by the author. These entries also contain the author's name, title of the document, book, or article, the year published, the publisher or name of the journal, locational reference to the annotation in the Catalog, and all other descriptors assigned the work.

Thus a scholar may choose one or more descriptors denoting his general topic; for example, political participation. Under that index heading he may scan for entries containing descriptors denoting the particular variables under study: those pertaining to certain times, countries, subjects, concepts, and methodologies. Works containing a cluster of relevant descriptors may then be noted, and studied further by consulting the annotations in the Catalog. In this manner, the URS not only reduces a scholar's literature "search time," but augments his "research time."

APPLIED FACTOR ANALYSIS

by R. J. Rummel

This is the first book to concern itself wholly with the application of factor analysis to social variables as distinct from psychological tests. A general technique suitable for many problems peculiar to the social sciences, factor analysis is a mathematical method with roots in linear algebra rather than primarily a statistical technique. It has a geometric interpretation that gives the social scientist power to visualize, graph, and physically model the abstract social relations being analyzed. Thus the method can be used as a mathematical structure for building rigorous social theory.

2 texts that reflect American political change in thought and action

DIRECTIONS IN AMERICAN POLITICAL THOUGHT

Edited by KENNETH M. DOLBEARE.

As the demand for change in the policies and structure of our political system intensifies on the part of an increasingly large proportion of the electorate, the need to understand the relevance of American political values to contemporary problems becomes vitally important. This book provides the framework for a significant understanding of that relationship.

Twenty-four selections are presented from the works of major American political thinkers from Paine, Jefferson, Madison, Adams, and Hamilton, to such contemporary writers as Russell Kirk, Peter Viereck, Milton Friedman, Arthur Schlesinger, Jr., John Kenneth Galbraith, Michael Harrington, Martin Luther King, Herbert Marcuse, Tom Hayden, and Stokely Carmichael. The selections are of sufficient length to permit students to get a clear sense of the values and priorities of each thinker and to develop the vital intellectual skills of independent critical analysis and evaluation of political ideas.

1969 516 pages \$9.95

POWER AND CHANGE IN THE UNITED STATES

Empirical Findings and Their Implications

Edited by KENNETH M. DOLBEARE,
University of Wisconsin.

Dolbeare's excellent anthology represents the first attempt to use empirical articles for their evaluative possibilities, to make orthodox political science have social relevance for students. Three brilliant interpretive essays devote themselves to the *meaning* for today's students of some leading empirical studies, much lauded but little understood in terms of the basic questions about who holds the power in our society and how change can be brought about. Dolbeare's anthology, in short, is a small-scale textbook which enables students to become their own analysts and to confront important political questions with the aid of the author's helpful interpretive essays, about where the United States is going.

This is an essential anthology for courses in American Politics, Political Parties and Political Behavior.

THE LAW RELATING TO ACTIVITIES OF MAN IN SPACE

S. Houston Lay and Howard J. Taubenfeld

Once man has broken the hold of the atmosphere, what law directs his actions? By what legal code are competing nations bound as they commence their exploration of the universe? As continuing ventures into space become more complex, there is a need for internationally recognized laws controlling, or pertinent to, space activities. In this study, the authors analyze the relevant laws of nations as they exist at this time, whether they are derived from treaty, custom, statute, or related sources. Ways in which this body of law may develop in the future are also treated as well as problems which may be encountered. Wide-ranging and comprehensive, with a topical bibliography, this book is an important addition to the scholarship of an emerging field.

1970 LC:77-102747 360 pages \$17.50

COMMUNISTS AND THEIR LAW

*A Search for the Common Core of the Legal Systems
of the Marxian Socialist States*

John N. Hazard

This is the first full-length book in English to survey the implementation of policy by law throughout the communist world. Hazard points out that the Marxian socialist legal system was not wholly a post-1917 invention, for a good many legal institutions remained unchanged from tsarist days or were based on tradition in Western European countries. Nevertheless, it may be characterized as genuinely distinct from the Romanist tradition. Professor Hazard's analysis is tempered with insights gained through years of first-hand contact with Soviet law, and his discussions of the various differences between statute and actual legal practice lend particular significance to his work.

1969 LC:75-92770 560 pages \$8.75

INDIA AND THE SOVIET UNION

The Nehru Era

Arthur Stein

This study examines the interaction between India and the USSR primarily from the Indian vantage point, focusing on the factors which led to the development of close ties between two major countries with basically different socio-political systems. Analysis is provided of what Prime Minister Nehru's policies attempted to achieve and to what extent the objectives were realized. Professor Stein analyzes the areas of accord and disagreement, harmony and tension, in a relationship which evolved from Soviet hostility prior to 1953 to a mood which could be termed "cooperative coexistence." The study also gives extensive coverage and analysis of East-West relations, seen mainly from the perspective of nonaligned and communist countries.

1969 LC:73-91656 320 pages \$9.50

ANNOUNCES

*An important collection of articles
dealing with man and his environment*

ECO-CATASTROPHE

*By the EDITORS of RAMPARTS
with a Foreword by Paul Ehrlich*

Man's pollution of his environment and interference with natural order are now drastically affecting his physical and emotional health. This collection of original ecological articles from *Ramparts*—nine of which will appear for the first time in the May, 1970 issue—focuses on general problems and specific instances of environmental deterioration which affect food, population, water, air, and the balance of nature. The problem, in the strict sense of the word, is not scientific, and neither is the book. Rather, the articles were selected to point out individual responsibility to the crisis. Typical articles include "Para-Real Estate: The Handing Out of Resources" by James Ridgeway, "Eco-Catastrophe" by Paul Ehrlich, "Raping Alaska" by Barry Weisberg and David Kolodney, and "Santa Barbara: Oil on the Velvet Playground" by Harvey Molotch. Ten color plates. May, 1970. Paper. \$2.95

NATION-BUILDING IN AFRICA

Problems and Prospects

by **ARNOLD RIVKIN** Edited by John E. Morrow

Policy-maker and scholar, the late Arnold Rivkin set forth his conclusions—often troubling, sometimes controversial, always realistic—about the politics, problems, and prospects for successful nation-building in the recently emerged African states. He viewed the problem as more complex than most Americans believe it to be, and his book is a reasoned and informed exploration, nation-by-nation of the relation between political stability and the capacity for peaceful change and economic growth. A major volume in the area of African political dynamisms. 312 pages, maps, tables, appendixes, notes, index \$10.00

ANGLO-AMERICAN POLITICAL RELATIONS 1665-1775

Edited by **ALISON GILBERT OLSON** and **RICHARD MAXWELL BROWN**

Ten American historians present some new propositions in their examination of Anglo-American relations and politics prior to the Revolution. Focus centers on the attitudes of the colonies toward England, their struggle for recognition, the pressures exerted on the colonies by the Crown, and the causes of the Revolution. A welcome addition to the limited literature on the subject during the pre-revolutionary period. 304 pages, 2 diagrams, notes, index \$10.00

STRENGTHENING THE STATE LEGISLATURE SERIES

This continuing series of paperbound monographs explores individual legislative systems and structures. Each study makes important recommendations to promote efficiency, enhance independence, stimulate participation and increase incentives. OBLIGATIONS

Essays on Disobedience, War, and Citizenship

by Michael Walzer

If you cannot say "Yes" to your government, how far are you required to aid and abet it in its enactments? Mr. Walzer, Professor of Government at Harvard, describes how citizens and members of political parties and movements acquire obligations, how they sustain these obligations, and how — sometimes — they abandon them. Taking into account the theory of "the consent of the governed," he considers how his contemporaries can and do participate in the most controversial forms of action open to them: dissent, civil disobedience, war, and revolution. He reveals an extraordinary understanding of rebels, radicals, and rational revolutionaries, and approaches the issue of the obligations of citizens with insight and historical perspective. \$7.95

Political Trends in the Arab World

The Role of Ideas and Ideals in Politics

Majid Khadduri

Dr. Khadduri analyzes the Arab search for a political system that will facilitate modernization and enable the Arab world to meet the challenge of the West. He presents a conceptual framework that clarifies the progress of the debate among Arab reformers and thinkers as they have grappled with the problem of revitalizing the Islamic polity.

\$10.00

Foundations of British Policy in the Arab World

The Cairo Conference of 1921

Aaron S. Klieman

Drawing on previously unavailable documents of the British government as well as private papers and memoirs, Mr. Klieman uses the Cairo Conference as the focal point for a detailed study of Britain's involvement in Middle Eastern affairs. He concludes that many of the contemporary problems of the Middle East originated in this earlier, decisive period.

\$10.00

Arab Intellectuals and the West

The Formative Years, 1875-1914

Hisham Sharabi

The Arab Awakening, the term Arab intellectuals have used to describe the process of "modernization," was a product of the challenge posed by the West on all levels of life—social, political, economic, and psychological. Dr. Sharabi examines this challenge and the Arab response to it among the thinkers and activists of Egypt and the Fertile Crescent.

Fashoda Reconsidered

The Impact of Domestic Politics on French Policy in Africa, 1893-1898

Roger Glenn Brown

In the fall of 1898 two crises simultaneously convulsed the French Third Republic: the Dreyfus Affair and the Fashoda Incident. Using this conjunction of crises as a focal point, Dr. Brown draws on new source material to analyze the interaction of domestic and international politics and the processes of French imperialism in Africa.

\$7.50

Paul Tillich's Dialectical Humanism

Unmasking the God above God

Leonard F. Wheat

In this major study of a controversial modern theologian, Leonard Wheat provides a clear and concise summary of the dialectics of Hegel and Marx. His original insights into the application of Marxist and Hegelian theories of history will prove to be valuable sources of lecture material for courses in political theory.

Soviet Power and Europe, 1945-1970

THOMAS W. WOLFE Moscow's aims and interests in the key European arena of world politics are the subject of this important new RAND study of postwar Soviet policies toward both halves of a partitioned Europe. Taking military as well as political factors into account, Dr. Wolfe provides the first comprehensive assessment of the policies of the Brezhnev-Kosygin regime and a full historical perspective of the evolution of Soviet power and diplomacy. \$15.00 cloth, \$3.95 paper

The Soviet Union and Arms Control

A Superpower Dilemma

ROMAN KOLKOWICZ and others Why, after years of delay, have the Soviets now agreed to discuss arms control? This lucid discussion of the Soviet position on arms control analyses the political, economic, strategic, and institutional pressures inside Russia, as well as the stresses imposed on her by China, the U.S., and NATO. It looks beyond the SALT talks to the realities on which U.S.-Soviet negotiations must be based if they are to have any chance of success. \$8.00 cloth, \$2.95 paper

A new title in the series Integration and Community Building in Eastern Europe

The Hungarian People's Republic

BENNETT KOVRIG Drawing on political, sociological, and economic data, Bennett Kovrig focuses on Hungary's experience as a member of the Communist Party-state system of Eastern Europe. He discusses what communism has meant to the country's community life, how it has changed since pre-communist days, and its forced integration with the other Communist Party states. \$7.50 cloth, \$2.45 paper

Party and Constituency: Pressures on Congress

JULIUS TURNER

Revised Edition by EDWARD V. SCHNEIER, JR.

In 1951 Julius Turner was the first political scientist to use statistical techniques in the analysis of roll-call votes. He tried to determine if there were significant differences between the two parties, how much cohesiveness they displayed, and the impact on congressional voting behavior of party membership as well as constituency pressures. Though out of print since 1960, his book occupies, as Dr. Schneier puts it in his preface to this edition, a "watershed position in the intellectual history of political science."

This new edition both preserves and extends Turner's work. Taking advantage of the many new works on roll-call analysis and Congress, Dr. Schneier has followed to 1964, and in some cases to 1967, the trends and patterns Turner found for the period 1921-1944. In keeping with the spirit of the original, which above all strove for relevance with regard to contemporary problems, he has used Turner's data, framework, and methodology as the basis for a new book. \$10.00 cloth, \$2.95 paper

The Supreme Court and the Electoral Process

RICHARD CLAUDE

In recent years the Supreme Court has moved ahead of Congress and the Executive in a controversial attempt to "nationalize" the electoral process. Professor Claude's unique study brings together and analyzes the cases heard by the Court during the past 100 years which have most influenced voting rights and representation. He offers valuable insights into the role of litigation in the democratic process and indicates those issues most likely to be the subject of future litigation. \$10.00

Learned Hand's Court

MARVIN SCHICK

From 1941 to 1951, when Learned Hand was its chief judge, the U.S. Court of Appeals for the Second Circuit was one of the most highly respected tribunals in judicial history. Professor Schick's historical, biographical, and behavioral study analyzes more than 3,000 decisions handed down by the court, describes its unique procedures, and correlates the votes of Second Circuit judges with the subsequent decisions of the Supreme Court. \$12.50

THE FOREIGN OFFICE AND FOREIGN POLICY 1898-1914

ZARA S. STEINER

A study of the Foreign Office at a decisive period in its history. It tells how a secretarial department, archaic in tone and manner, developed into a major department of state.

The personalities, cast of mind and political stance of the men who staffed the Foreign Office, the foreign secretaries and their permanent officials, form the focus of the book. Mrs Steiner also examines some of the outside forces which shaped policy and created the climate of feeling and opinion in which Whitehall operated.

CHARACTER AND STYLE IN ENGLISH POLITICS

J. H. GRAINGER

A study of leading English politicians from the Tudor period to the present. The author distinguishes between character and style as touchstones to identify and evaluate the qualities of the dissident politicians who spoke for country against court in the seventeenth century and those who took a stand in the eighteenth century but were assimilated in the political order.

The book concludes with a discussion of Victorian political heroes and of notable leaders of the twentieth century.

New from Yale

The Analysis of Political Cleavages

by Douglas W. Rae and Michael J. Taylor

Defining political cleavage systems as the sources of division within a society, the authors of this methodological book analyze five important properties of cleavage systems in an attempt to offer more precise, more general, and therefore more powerful interpretations than now exist for some central concepts in this field. The properties examined include: the extent of division, the degree of crystallization, the degree of cross-cutting, the degree of overlap, and the intensity of division. Using elementary set theory and probability theory, the authors give mathematical definitions to each concept and apply these definitions to data from several nations and to theoretical problems.

The Costs of Accidents

A Legal and Economic Analysis

by Guido Calabresi

"Calabresi's book is most significant for its first-rate combination of modern economic analysis and legal policy. The methodology and underlying principles extend far beyond the particular subject matter of accident law to many other legal areas that could benefit from economic analysis. In turn, some economic analyses may become the richer for the discussion in this book. It is truly one of those rare important volumes."—Gerald M. Meier. \$10.00

The Environmental Crisis

Man's Struggle to Live with Himself

edited by Harold W. Helfrich, Jr.

"An unusually engrossing collection of 12 talks by a group of authorities who unburdened themselves of some pretty grim feelings and facts about 'man's struggle to live with himself.' . . . Straightforward and often brilliant talking on the 'Russian roulette' we are playing with 'biogeochemical cycles,' on the facts and fallacies surrounding potential world famine, on the promises and perils of weather control, on our outmoded concepts of 'nature,' on governmental 'fun and games' that in the end won't fool anybody, and even on the despoiling of the sea."—*Publishers' Weekly*. cloth \$7.50; paper \$1.95

British Colonial Administration in the Mid-Nineteenth Century

The Policy-Making Process

by John W. Cell

Examining the constant factors in British colonial problems—the Colonial Office, the administrative centers in the colonies, and the connections between them, Mr. Cell provides an illuminating picture of administration in action. His delineation of the evolution of policy shows that the pattern of decision-making was typically one of hesitation rather than the steady application of a coherent plan. \$10.00

...laws conflict... courts must decide

John Marshall

THE POLITICS OF FEDERAL COURTS

Richard J. Richardson, University of North Carolina

Kenneth N. Vines, State University of New York at Buffalo

This study of the federal courts examines and describes the federal court system as a political institution. Emphasis is placed on the district and circuit courts where most of the decisions in the federal court system are made and where the important issues first are shaped and defined. The role of each court, including the Supreme Court, is examined as to its distinctive place in the federal judicial process.

Many factors shape the politics of the federal courts. Some of these are the recruitment of judicial personnel, the organization of the courts, the nature of the judicial process, the character of litigation in the courts, the historical and institutional context within which the courts operate, as well as exogenous political pressures. In addition, the patterns of decision making within the courts and variations among judicial personalities, different court levels and institutions are important factors in determining the politics of the courts. These are examined by themselves and in relationship to each other.

...Politics is still the greatest and the most honorable adventure.

John Buchan

THE PRESIDENCY

Aaron Wildavsky, Editor *University of California, Berkeley*

The aim of this large volume of essays and excerpts, in the words of Professor Wildavsky, is "to make the presidency a subject of social science analysis."

To this end the editor has devised a new organization of materials emphasizing three basic concepts necessary for a meaningful study of the presidency – role, personality, and power. The editor argues that any individual president can best be understood in relation to his "publics". A consideration of these arenas of mutual interaction – the people, the press, the parties, Congress, the executive branch, and the courts – comprises the latter two-thirds of the book, much of which is entirely new and written expressly for this volume.

Cloth / 816 pages / \$9.95

PARTY POLITICS IN AMERICA

Frank J. Sorauf, *University of Minnesota*

This book, published in 1968 and a continuing best-seller, describes the American political parties as they are today and suggests why they are that way, how they differ from other political parties and what roles and activities they perform in the American political system. It is both an analytical and descriptive approach to the parties as organizations and to their main activities as political parties. The text avoids endless detail while still giving the student an analytical framework on which to "hang" descriptive data.

"This book is particularly suited to a quarter course in politics in which time does not permit the study of pressure groups. Descriptively, it does a thorough job in relating the political party in its operational context. Analytically, it should serve to cause the student to think about politics in some new and meaningful ways." . . . Donald L. Fairchild, Georgia State College

Cloth | 438 pages | \$7.50

THE POLITICS OF LOCAL JUSTICE

James R. Klonoski, *University of Oregon*

Robert I. Mendelsohn, *Wayne State University*

What is justice? Who gets justice? And how and why does one get justice in the kind and amount he does? These readings on "law and order" describe and analyze how decisions in the legal system are influenced by the local political setting in which they are made. The editors feel that justice is "distributed" by the functioning of legal instruments, in the same way as money is by business institutions, and as education is by schools.

Paperbound / 288 pages / \$3.95

AMERICAN POLITICAL INSTITUTIONS AND PUBLIC POLICY Five Contemporary Studies

Allan P. Sindler, *University of California, Berkeley*

Contributors: *Theodore R. Marmor, Eugene Eidenberg, Richard Blumenthal, Robert L. Peabody, and Andrew Hacker.*

A text which has proven to be a perfect supplement for American government courses.

Stressing the policy processes of American democracy, this select group of specialists has presented five case studies, each providing directed insights into the fascinating array of contemporary institutions and programs. Through these the student may witness the interaction of the major institutions of American political life: the Presidency, Congress, the Supreme Court, Political Parties, and the Bureaucracy.

Written in a manner that retains the drama of actual events, these studies are carefully drawn by the editor and the authors so that political processes and institutions may be seen to interrelate and so that the structures and functions of government as described in good textbooks may be comprehensively illustrated.

OUTSTANDING BOOKS FROM KENTUCKY

MILITARY JUSTICE AND THE RIGHT TO COUNSEL

S. Sidney Ulmer

Concern for the protection of one's rights has finally reached the military. The large number of citizen draftees presently serving in the military has resulted in pressure being brought on Congress to bring about a liberalization of military law. Ulmer examines the development of American military justice in the context of military prosecutions. He shows how lawyers who have represented military personnel have been most responsible for bringing about improvements in military justice. Ulmer makes a comparative analysis of the rights of civilians and of military men, shows the historical development of both, and concludes that there has been more progress in civilian than in military law. Nevertheless, he feels that considerable progress has been made in both fields. This book is timely and interesting and makes a significant contribution to the literature concerning the civil rights of individuals.—Library Journal

DEVELOPMENTAL CHANGE

An Annotated Bibliography

Allan A. Spitz

A thorough guide to useful resources on development and modernization of the undeveloped areas, this comprehensive bibliography orders and annotates nearly 2,500 articles appearing since 1945 in 234 journals published in 25 different countries. The entries are arranged by subject and indexed by both author and journal. The citations are divided into six major areas, then into further subdivisions for ease of access. The book places special emphasis on new and little-known sources. It also includes a selected bibliography of books and monographs. \$12.50

THE UNIVERSITY PRESS OF KENTUCKY

LEXINGTON

AUTHORS WANTED TO WRITE ONE OR MORE CHAPTERS FOR A NEW/ AMERICAN GOVERNMENT TEXTBOOK (INTRODUCTORY LEVEL) FOR SENIOR AND JR. COLLEGES

OBJECT IS TO MAKE THIS TEXT AVANT-GARDE AND RELEVANT TO THE NEEDS OF TODAY'S COLLEGE POPULATION.

CONSULTING EDITORS ALSO NEEDED TO READ AND EDIT CHAPTERS.

On a fee basis. We are eager to contact *specialists* in their field who can either *write, revise* or *edit* chapters of this text. We are looking for college professors, instructors, and other capable authors with a solid writing ability. Grad students working with a professor welcomed.

Some of the new chapters needed are:

1. SOCIAL ATTITUDES TOWARD THE GOVERNMENT AND LAW. The Problems of "Leadership." "Are We All Policemen?" etc. Scapegoating of political leaders; the Problem of the Family. Are leaders "out-of-touch"?
2. THE DISINTEGRATION OF THE CITIES. The "De-escalation" of the Cities.
3. THE MYTH OF THE MELTING POT.—Inter-group tensions. *Human Zoo* concepts and other scientific theories applicable to human behavior.
4. THE DANGER OF OVER-POPULATION
5. ENVIRONMENT, ECOLOGY AND POLLUTION
6. THE "DRUG CRISIS" IN AMERICA AND THE WORLD & the "White Death" (The Heroin Epidemic)
7. CRIME AND VIOLENCE.
8. SAFETY IN YOUR STREET, your home, business and school. Community Rehabilitation.
9. "HIPPIECULTURE," the "BLACK POWER MOVEMENT" and the "SEXUAL REVOLUTION" (myth and fact) examined.
10. THE VIETNAM WAR—"Finding a 'Face-saving' Peace in a 'Dishonorable' War."
11. PEACE & WAR. Psychological, sociological and scientific theories to explain war and peace. Hopes for the Future of Mankind. The Military Industrial Complex; "Game Behavior" of people, groups and nations.
12. REVOLUTION, "REBELLION" PERSONALITY, AND THE PROBLEM OF THE "FAMILY"
13. RELIGION
14. SOCIAL CHANGE. The Problem of self-defeating behavior. Do you Change and/or does the World Change? Where is the "Happy Age"?
15. THE GROWTH OF PSYCHOLOGY AND SOCIOLOGY AND ITS INFLUENCE UPON GOVERNMENT. Psychological theories and methods.
16. THE COMMUNICATION GAP—The Media—Newspapers, Radio, Television, Magazines, records, talking, etc.
17. EDUCATION—Chaos in our Schools. The "Blackboard Jungle."
18. LIFE AND DEATH—Medicine, Health & Physical Fitness.
19. SUMMARY OF MAJOR SCHOLARLY AND POPULAR BOOKS, ARTICLES AND OTHER MEDIA ON AMERICAN GOVERNMENT. Ideas of the major political thinkers.
20. GUIDE TO ADVANCED STUDY, CAREERS AND GRADUATE SCHOOLS IN AMERICAN GOVERNMENT.
21. HOW TO WRITE RESEARCH PAPERS IN AMERICAN GOVERNMENT.

We also need artists and researchers for this text. If you are interested in the above kindly contact: Social Studies Editor, COLLEGE NOTES & TEXTS, INC. 184 Fifth Avenue, New York City, N.Y. 10010 or call 212-MU 3-8800.

Kindly send *Vita* or *resume*. Proposed chapter outline must accompany letter. Chapters should be moderately footnoted with a short annotated bibliography after each chapter (about 25-30 books and articles) and should include pictures, diagrams, charts, etc. where necessary. Each chapter should be approx. 7500 wds. (i.e. 25 typewritten double spaced pages) including 1000 wds. of exam type questions and answers. Chapters are due on Sept. 15, 1970 or earlier. Text to be published fall of 1970. FEE SCALE as follows:

New Chapters	\$350 each
To Revise a Chapter	\$200 each
Editing and Consulting per Chapter	\$ 40 each

ABC POL SCI

ADVANCE BIBLIOGRAPHY OF CONTENTS:
 POLITICAL SCIENCE AND GOVERNMENT

A WORLDWIDE BIBLIOGRAPHICAL GUIDE TO THE STUDY OF POLITICS AND SOCIETY

What is your field of interest?

Political theory, public administration, international relations, comparative government, political sociology, election studies, law, military affairs?

These subjects — and many others on government, our society, and the world — are now covered in a quick service designed to keep up with the explosive increase in periodical literature.

ABC POL SCI (Advance Bibliography of Contents: Political Science and Government) is a solution to the problem of keeping current. It annually lists articles from the contents pages of more than 300 journals . . . concurrently or

in advance of publication dates. Coverage includes periodicals and other serials (yearbooks, etc.) from all over the world.

An index to each of the issues provides a quick reference to names, countries or areas, court cases, and topics.

- Nine issues per year, including Annual Subject Index
- Index to each issue
- Article Copying Service
- Individual Subscribers: \$6.50 per year (Libraries: write for institutional rates)

* 300 journals included. Relevant journals added regularly.

Dept. APS

ABC POL SCI • Riviera Campus, 2010 A.P.S., Santa Barbara, Ca. 93103

☐ Please enter my subscription to ABC POL SCI, beginning with Volume 2 (1970) — 9 issues including Annual Subject Index at \$6.50.
 PLEASE INCLUDE PAYMENT WITH YOUR ORDER.

☐ Send descriptive brochure so that I can learn more about ABC POL SCI.

Washington, D.C. 20036

PROCEEDINGS OF THE ANNUAL MEETINGS
of

The American Political Science Association

Complete proceedings of the APSA Annual Meetings (including copies of all papers delivered from 1956 through 1968) may be obtained by contacting the Customer Services Department, University Microfilms, Ann Arbor, Michigan 48106.

PROCEEDINGS on Microfilm: \$22.50 per reel
In hard copy (individual papers): \$2.00 each
Prepayment Required

YOU MEAN I CAN GET **\$50,000** OF TIAA LIFE INSURANCE FOR LESS THAN **\$100?**

That's what an Assistant Professor asked us when he heard about TIAA's low life insurance costs.

It's true. At his age 30 the annual premium for a 20-Year Home Protection policy providing \$50,000 initial amount of insurance is \$159.00. The first-year dividend, based on our current dividend scale, is \$61.00, making a net payment of \$98.00. Dividends, of course, are not guaranteed.

The Home Protection plan is level premium Term insurance providing its largest amount of protection initially, reducing by schedule each year to recognize decreasing insurance needs. This is just one example of the many low-cost TIAA plans available. If you need more protection for your family, ask us to mail you a personal illustration with figures for a policy issued at your age. We'll also send the Life Insurance Guide describing other TIAA policies.

ELIGIBILITY

Eligibility to apply for this or other TIAA life insurance is limited to persons employed at the time of application by a college, university, private school, or other nonprofit educational or scientific institution that qualifies for TIAA eligibility.

The Political Education of Arnold Brecht **An Autobiography, 1884-1970**

Appointed Cabinet Secretary by the last imperial Chancellor, Arnold Brecht served in the German government until dismissed by Hitler in 1933. His autobiography is a rich account of the peculiarly coherent sequence of events of that period: the catastrophe of World War I, the nerve-wracking decisions of the Armistice, Hitler's ascent to total power. Observer and participant, Arnold Brecht has written a book which is at once an absorbing personal narrative and a work of applied political theory. \$15.00

Yugoslavia and the Nonaligned World

Alvin Z. Rubinstein

Alvin Z. Rubinstein examines the determinants which shaped Belgrade's turn to the new nations of Asia and Africa and its role in pioneering nonalignment. He discusses the policies of Yugoslav leaders in their quest for security and international influence, traces Tito's relations with Nasser, and explores Belgrade's role in the Moscow-Peking rift. \$11.00

Tanzania

Party Transformation and Economic Development

Expanded Edition

Henry Bienen

In this new edition, the author discusses the events and significance of the Arusha Declaration. "... much more than a study of the Tanganyika African Nationalist Union. . . . It is also a study of the history, ideology, commitment, and the role the party plays in all aspects of life in Tanzania. . . . very informative and readable. . . ."—*Library Journal* on the first edition.

Published for the Center of International Studies, Princeton University

Cloth, \$11.50; Paper, \$3.45

Princeton Paperbacks

The Atomic Bomb and the End of World War II

Herbert Feis

Originally published as *Japan Subdued*, this edition is more complete and revealing because of the inclusion and analysis of new information on the decision to use the atomic bomb. \$2.95 (Cloth, \$6.00)

Parroting Is For The Birds

Have you heard about MENTOREX yet?

With MENTOREX, students stop parroting and start *thinking*. Better yet—they *learn how to learn*.

Research shows students tend to study only those portions of a course they think they're going to be tested on.

MENTOREX is different. It takes your students *past* memorization... as they *THINK* their way through the fascinating pages of the MENTOREX Study Skills Manual.

But that's only half the story. MENTOREX supplies you the instructor with the MENTOREX Test Item Catalog—listing 2000 computerized items designed to probe your students' cognitive skills.

From it you select multiple-choice test questions that reflect your own personal emphasis. MENTOREX is your obedient servant: at all times you retain total control.

By mail you receive computer-prepared MENTOREX masters of your tailor-made classroom tests. MENTOREX scores

your students' replies... interprets... provides an in-depth analysis of *each student's performance*.

In a recent field test, an incredible 96.1% of students polled were either "positive" or "enthusiastic" on the value of MENTOREX for learning and improving their classroom test performance.

96.1% of *your* students may feel the same way.

For further information, write us a note—or fill out the handy coupon.

The Regulators

Watchdog Agencies and the Public Interest

LOUIS M. KOHLMEIER, JR.

"The author covers the whole broad front of governmental regulation—the President and the executive agencies, the Supreme Court and constitutional law, the Congress and its committees, and its creatures, the independent regulatory commissions. . . . Anyone who is teaching a course in government and business, or even an introductory U.S. Government course, will find this book useful supplementary reading. The instructor can even tell his students to skip the last chapter, and to come up with their own proposals to cure the mess of federal regulation. In other words, the author of this book states the problem, and describes the situation well enough to serve pedagogically as well as otherwise."—Henry Reining, Jr. in *The Annals of the American Academy of Political and Social Science*. September, 1970. Paper. Tentative: 338 pp.; \$2.95

The Stable Crisis

Two Decades of German Foreign Policy

WOLFRAM F. HANRIEDER

This treatment of West German foreign policy from 1949 to the present brings together international and domestic perspectives, stressing their mutual impact. The Federal Republic's three major goals—security, political and economic recovery, and reunification—are treated chronologically, with emphasis on the international environment within which they met success or failure. Where relevant, policies of West Germany's allies, and those of the Soviet bloc, are discussed. Domestic consensus or opposition to government programs is explored through discussion of political parties and relevant pressure groups. May, 1970. Paper. 221 pp.; \$3.50

Issues and Parties in Legislative Voting

Methods of Statistical Analysis

DUNCAN MacRAE, JR.

Unusual in its degree of mathematical rigor, this book is intended to help evolve a new approach to teaching research methods in political science. Using some calculus, it introduces matrix algebra and factor analysis. Develops methods of cumulative scaling, cluster and factor analysis and applies them to distinct procedures for identifying issues and measuring partisanship from roll-call data. The methods introduced are adapted and modified so as to be most applicable to the particular problems of roll-call analysis. February, 1970. 329 pp.; \$9.95

Political Ideas and Ideologies

A History of Political Thought

MULFORD Q. SIBLEY

An introductory text dealing with the issues of political theory and the history of political thought. In four parts: ancient political speculation among the Hebrews, Greeks, and Romans, and political ideas implicit in the New Testament; major currents of political thought and ideology in the "Christian centuries" (100 A.D. to 1500 A.D.); predominant lines of development from the Renaissance to the end of the 18th century; major political thought since the French Revolution. Political ideas related to historical events and to the general history of science and philosophy throughout; analysis and criticism of each body of ideas. Overall effort to show the history of political ideas as a continuing dialogue between alternative viewpoints. May, 1970. 612 pp.; \$10.95

Washington, D.C. 20036

THE AMERICAN POLITICAL SCIENCE REVIEW, published quarterly during the months of March, June, September, and December, is supplied to all APSA members. Individual and institutional memberships are \$15.00 a year (\$6.00 for graduate and undergraduate students; five-year limitation). Foreign currency at the official exchange rate will be accepted for foreign subscriptions and foreign membership fees. The equivalent of \$1 for additional postage should be added for foreign subscriptions.

Current issues are priced at \$3.75 per copy; for *back issues* prior to 1963 address Johnson Reprint Corp., 111 5th Ave., New York, N.Y. 10003; subsequent to 1963 send request directly to the American Political Science Association.

Applications for membership, orders for the *Review*, and remittances should be addressed to the Executive Director, The American Political Science Association, 1527 New Hampshire Ave., N.W., Washington, D.C. 20036. *Notices of change of address* should be received in the Washington office by the 25th day of the month before publication.

Address correspondence about contributions to the *Review* to Austin Ranney, North Hall, University of Wisconsin, Madison, Wis. 53706. All manuscripts should be submitted IN DUPLICATE. They should be double-spaced and may be in typed, mimeographed, hectographed, or other legible form. Footnotes should appear at the end of the manuscript, not at the bottom of the page.

Since manuscripts are sent out anonymously for editorial evaluation, the author's name and affiliations should appear only on a separate covering page. All footnotes identifying the author should also appear on a separate page.

Address books intended for review to Richard F. Fenno, 575 Mount Hope Avenue, Rochester, New York 14620; information, including News and Notes, for the Association's newsletter *P. S.*, should be sent to 1527 New Hampshire Avenue, N.W., Washington, D.C. 20036; advertising, reprint and circulation correspondence to the Executive Director at the Washington office.

Articles and notes appearing in the *Review* before the June, 1953 issue were indexed in *The Reader's Guide to Periodical Literature*. *The International Political Science Abstracts* and the *International Index to Periodicals* index current issues. Microfilm of the *Review*, beginning with Volume 1, may be obtained from University Microfilms, 313 North First Street, Ann Arbor, Michigan 48106. A *Cumulative Index of the Review*, Volumes 1-62: 1906-1968, may also be obtained from University Microfilms. Articles appearing in the *Review* are listed regularly in *ABC Pol Sci* and *Current Contents: Behavioral, Social & Management Sciences*.

Office of publication: Curtis Reed Plaza, Menasha, Wisconsin.

Foreign Agent: P. S. King and Staples, Ltd., Great Smith Street, Westminster, London.

Second class postage paid at Washington, D.C., and at additional mailing offices.

Printed in the United States of America by George Banta Company, Inc., Menasha, Wisconsin.

Copyright, 1970, by The American Political Science Association

Thoughts on **POLITICS and ENVIRONMENT**

Identity, Power, and Change

Edited by
Michael A. Weinstein, Purdue University
Writings by:
PLATO/LASSWELL/FROMM/
ROUSSEAU/EASTON/MARCUSE/
HOBBES/DAHL/CAMUS

This unique reader applies theoretical approaches to relevant issues, lending clarity and meaning to the study of political theory. In a disciplined and systematic presentation, it introduces students to a wide range of political opinion and philosophy. Selections amplify various schools of political thought—psychological, systems, and conflict—while within each category are pieces from a classical writer, a behavioralist, and a social critic. Substantial introductory and concluding essays by the editor, in addition to headnotes for each reading, place the works in a significant context whereby students can analyze and integrate material from within the broad spectrum of political theory.

©1970, approx. 288 pages, softbound \$3.75

The Crisis of Survival

Articles by:
ODUM/DeMOTT/DARLING/LINDSAY/
ILTIS/STEIF/BERLAND/HOWARD/
WALD/MILES/INGLIS/NADER/
BOULDING/GIBSON/BORLAND/
NELSON/SPROUT/HAYES/
HILL/KENNAN

A striking collection of articles on the critical state of our present environment and the prospects for survival in the future, this is the most complete and authoritative book available on the subject. Devoted entirely to the analysis of environmental problems and proposed remedies, it brings together articles written by leaders in the drive for ecological reform. Selections represent reasoned scientific, political, and humanistic views of the nature and scope of the crisis. General introductions by Eugene Odum and Benjamin DeMott add more complete coverage and insight into the crisis. With its candid and thorough examination of environmental problems and prospects, this is more than a valuable guide and sourcebook — it is a major contribution to the field of environmental health.

KENYA'S AFRICANIZATION PROGRAM: PRIORITIES OF DEVELOPMENT AND EQUITY*

DONALD ROTHCHILD
University of California, Davis

Africa's postindependence leaders are under enormous pressure. They must assume such new functions as the conduct of foreign relations and military defense and must expand developmental activities greatly, all at a time of falling world commodity prices, population explosion, and increasing indifference to foreign aid on the part of the wealthier countries. Local African expectations are rising, even though such requisites for satisfying these aspirations as capital, skills, and initiative remain in short supply. Nationwide linkages and a national identity must be built in the face of quickening ethnic anxieties and inward-lookingness. The functional benefits offered by a continued non-African presence must be secured without causing deep-seated popular frustrations; such frustrations could clearly jeopardize the regime's legitimacy should they become too extreme. The need for schools, hospitals, and welfare activities are juxtaposed against such pressing requirements as the development of power facilities, irrigation schemes, road networks, and industries. The choices are difficult and the demands heavy. No wonder Aristide Zolberg remarks that the "governments with the lowest load capability have assumed the heaviest burdens."¹

* This is a revised version of a paper presented at the 1969 Annual Meeting of the American Political Science Association. I wish to express my appreciation to Professors Alexander Groth and Larry Wade for helpful comments on the original manuscript.

¹ "The Structure of Political Conflict in the New States of Tropical Africa," this *Review*, LXII (March, 1968), p. 73. Also see Rupert Emerson's discussion in *Political Modernization: The Single-Party System*, University of Denver Monograph

If these restrictions of international environment and resources did not impose sufficient constraints upon governments as they attempt to cope with developmental needs, their flexibility of movement is further constricted by the pulls of ideology. African countries, fresh from an encounter with powerful, privileged European states, carry over a wide range of liberal commitments into the postindependence period. They are naturally determined to continue the struggle against any remaining manifestations of colonialism on the continent—white settler oligarchies, neocolonialist military and economic arrangements, or politically-inspired alignments with powers outside of Africa. Their leaders proclaim both nationalist and pan-Africanist objectives and call simultaneously for a leveling egalitarianism and rapid economic growth. The extent to which they can reconcile these somewhat overlapping, and even conflicting, goals with the compelling claims implicit in nation-building remains a crucial question with broad implications for regime stability.

This essay focuses upon the role of the non-African communities in Kenya's economic life and concentrates upon national policy with respect to the Africanization of the public and private sectors of the economy. Conflicts in two demand situations—for Africanization on the one hand and for economic development on the other—are analyzed in the context of Kenya's politics and related to the government's present values and priorities. The likelihood of increased or decreased responses to these sometimes conflicting demands is examined with a view to pointing up possible directions which changing

No. 1 (Denver: University of Denver, 1964), pp. 9-10.

governmental priorities might take and their implications for the European and Asian minorities residing in the country.

I. INPUTS: EQUITY DEMANDS

Africanization involves a large set of demands upon government in Kenya. During colonial times, Africans performed most of the unskilled jobs in the country, Europeans held many of the management, professional, and higher technical posts in the public and private sectors, and Asians were predominant in middle-level clerical, technical, and commercial positions. The inequalities of opportunity of the colonial period appeared at every age level. Using 20-29 year-old males as a basis of comparison, the 1962 census showed 63 per cent of the Europeans having secured nine or more years of schooling, 59 per cent of the Asians, and four per cent of the Africans.² Whereas the statistics on Europeans in the key occupational groups showed 42 per cent in professional and managerial posts and 17 per cent in technical and supervisory posts, those for the Asians were 23 per cent and four per cent respectively and for Africans were approximately one per cent in the two categories combined.³ As to the distribution of earnings, a similar lopsided pattern was evident; in 1962, the small Asian and European communities earned £46.8 m. in a total annual wage bill of £88.8 m. In the private sector, 29 per cent of the regularly employed European males earned more than £1,800 per annum and another 29 per cent earned between £1,200 and £1,799. Comparative statistics for the other communities showed 18 per cent of Asian males earning £720 and over, and one per cent of the African males earning £600 or more in the 1962 period.⁴ Such glaring inequities naturally provoked African claims to greater opportunity. Jomo Kenyatta's appeal to European goodwill in 1943 was a remarkably restrained expression of African feelings on the subject:

Let the Africans have equal educational facilities with the Europeans, and leave them free to make the best use of them. Give them an equal chance of economic enterprise, equal opportunity in business and the professions, and a say in the Government of the country. If they then show themselves unequal to the strain of Western civili-

zation, they will have no right to resent being treated as a backward race.⁵

Not surprisingly, the marked inequalities of opportunity among races in colonial times carried over into the period following the transfer of power. The three-tier pyramidal structure of Europeans at the top followed lower down by Asians and then Africans was too firmly entrenched in such areas as education, welfare, and incomes policies to give way rapidly or easily to a change in the governmental power structure. The Ministry of Education, in an effort to correct the imbalances of the past, announced that by 1967 all schools which were formerly for non-Africans must enroll not less than 50 per cent Africans (increased to 65 per cent in 1968); even though the long-run implications of such a policy are great, the transformation of the skilled manpower situation is certain to be gradual.⁶ Nevertheless some significant modifications became evident at the time of independence with regard to recruitment policies. Africans quickly came to man most of the positions in parliament and government as well as the policy-making posts in the civil service; even so, the racial structuring of opportunity persisted in the technical and professional fields and in private commerce and industry generally. Data on civil service personnel as of July, 1967 showed 91 per cent of the highest administrative posts Kenyanized; however, only 24 per cent of the posts in the professional cadre, 46 per cent of the higher executive cadre, and 65 per cent in the lower executive cadre had been taken over by Kenya citizens.⁷ Moreover, as the comparison in Table 1 brings out in strong relief, the proportion of jobs held by Africans in the public sector greatly exceeded those in the private sector.

Clearly, then, non-African control over investment capital and skills was too complete to erode with the first flush of political independence. As a result, many Kenyans, perceiving little apparent change in the distribution of goods and opportunities in the society, felt dissatisfied with the status quo. No doubt the aspirations of rural Africa are more limited than in urban and peri-urban areas; yet the cumulative pressure of these claims on government is enormous.⁸

The demand for Africanization was part of a larger nationalist drive for equality. Since Kenyan nationalism sought to eliminate the privileges implicit in the racial stratification of the old order, it placed greater weight upon egalitarianism than upon individual freedom and constitutional rights.⁹ As Ali A. Mazrui noted, "black people are the most aggrieved of all races in moral terms, even if they are better off economically than many Asians [in Pakistan and India]."¹⁰ The African struggle against colonialism was essentially a fight for human dignity as expressed in the form of equality between races. Thus nationalism became the battering ram of African group rights; if a conflict took place between the privileged minorities' demand for rights under the constitution and the African community's claim to corrective equity, nationalism was drawn instinctively to the African call for group rights. Nationalists might well have

⁹ These points are discussed at length in Ali A. Mazrui, *Towards a Pax Africana* (Chicago: University of Chicago Press, 1967), p. 99. Kenyan and Tanzanian nationalists tended to focus upon the common goal of equality in different ways. Kenyans frequently stressed the central objective of equality between races while their Tanzanian counterparts talked of achieving equality by eliminating class exploitation. For the latter, see President Julius Nyerere's remarks as reported in the *Nationalist* (Dar es Salaam), August 27, 1968, p. 1.

¹⁰ Ali A. Mazrui, *On Heroes and Uhuru-Worship* (London: Longmans, Green and Co., 1967), p. 242.

felt restrained in their actions by the important economic role played by minority peoples in the life of their country, but only reluctantly did they subordinate racial interests to the requirements of economic interests.

A survey of Kenya African attitudes toward minority groups I conducted in 1966 revealed the public to be nationalistic about its Africanization objectives and at the same time cognizant of the contribution of out-groups to the developmental process.¹¹ When asked what changes were desired in the conduct of retail trade in the country, a majority of respondents advanced various proposals for securing increased African management and ownership: more than 29 per cent of the total responses maintained that the government should hand over Asian businesses to Africans, another 23 per cent held that the government should give loans on easy terms to enable Africans to form their own businesses in order to compete with established Asian enter-

¹¹ Results are based upon 680 returned questionnaires out of a total sample of 730, or a return rate of 93 per cent. Twenty-seven of the 680 interviews were rejected as incomplete or dishonest. The interviews were conducted by 20 African men in the fall and winter of 1966; the place of interview was divided roughly evenly among urban (Nairobi), periurban, and rural areas throughout Kenya. Although this sample deliberately overrepresents urban dwellers (because I was interested in opinion data from the more politically mobilized sectors of the population), the sample nonetheless includes a more substantial proportion of rural respondents than are normally interviewed in public opinion research in Africa. Among those interviewed, 237 had completed primary school, 170 had completed secondary school, 152 had some secondary school, 47 had attended a university, and 47 were tribal elders. The following occupational categories were included: 183 teachers or students, 73 farmers, 63 government employees, and 334 non-government workers. For an emphasis on the important role of the "politically relevant strata of the population" in the political process of the African states, see Karl W. Deutsch, "Social Mobilization and Political Development," this REVIEW, LV (September 1961), 467-498. Also see James S. Coleman, "Conclusion: The Political Systems of the Developing Areas" in Gabriel A. Almond and James S. Coleman (eds.), *The Politics of the Developing Areas* (Princeton: Princeton University Press, 1960), pp. 535-536. For companion articles based on the same survey, see Donald Rothchild, "Kenya's Minorities and the African Crisis over Citizenship," *Race*, IX (April 1968), 421-437; and "Ethnic Inequalities in Kenya," *Journal of Modern African Studies*, VII (December 1969), pp. 689-711.

preneurs, and yet another 4 per cent affirmed that businesses owned by Asian noncitizens should be requisitioned and assigned to Africans. Since nearly one-third of the total responses favored a take-over of Asian businesses, a cross-tabulation of these respondents yields an interesting insight into the nature of the grass-roots demand for Africanization. The pressures for such an approach came most emphatically from older, less educated Kamba, Kikuyu, and Luhya males. Although 43 per cent in the 36-46 year-old bracket, 36 per cent of those completing primary school, 60 per cent of the elders, and 34 per cent of the males responded in this manner, only 33 per cent in the 18-35 year old age group, 28 per cent of those who completed secondary school or more, and 23 per cent of females did likewise. Moreover, responses by tribal group varied significantly. Whereas a high percentage of Kamba (48 per cent), Kikuyu (45 per cent), and Luhya (44 per cent) agreed to a take-over, the Luo (20 per cent) seemed not to feel as strongly the need for such a strategy.

Some typical expressions of opinion indicate the nature of African feelings on the question of a take-over of Asian businesses:

The only thing is to ask these Asians to leave by force and then the government should give the Africans loans to build such shops.

Well what I can say about it is that these retail trades should only be held by Africans and Asians to be under Africans.

Some Asians who have been trading for a long time and getting rich from Africans and other people, should leave such trades to Africans to manage. The government should give loans to Africans and the person concerned should mention the particular shop he wishes to buy and the owner should be persuaded to sell it. If they refuse to sell they should be forced or else they can start the business together.

Indians have not changed to know that we have Uhuru. They should be asked to leave the retail trade to Africans, I mean they should be bought over as European farms.

I think some of the big shops in town (Nairobi and other towns) should be given to Africans who can do the same thing. The government should ask some of the Asians to quit their shops to be taken over by the Africans. The government can use force in the matter.

Even while some Africans were expressing strong sentiments on the need for rapid Africanization, they were also mindful of the contribution which non-Africans were making to economic development. The African majority's sophistication on this matter emerged clearly from two related questions raised in the same survey as above (see Tables 2 and 3).

TABLE 2. AFRICAN ATTITUDES: PERCENTAGE OF THOSE WHO REPLIED THAT EUROPEANS AND ASIANS AS A WHOLE HELPED TO DEVELOP KENYA (N = 653)

Community Affected	True	False	Don't Know; No Answer	Total
Europeans	88%	11	1	100%
Asians	51%	47	2	100%

What is most striking about Tables 2 and 3 is the divergence in attitude regarding Asians and Europeans. The majority were much more suspicious of the intentions of the middle-level Asians than of the top-ranking Europeans. Superficially one might conclude that increased social distance between groups led to a more positive interpretation of out-group activities. But such interpretations are undercut to some extent by an examination of the responses in terms of tribe, age, and education, for in each of these instances proximity led to greater appreciation of the minorities' contribution. Only eight per cent of those who were Kikuyu, had some secondary schooling, or were in the twenty-year-old age group or under replied that Europeans had harmed development. This liberal cluster of responses appeared again in regard to the role of the Asians. Here 37 per cent of the Kikuyus, 37 per cent of those who had completed secondary education and above, and 35 per cent in the below-twenty age group viewed Asians as harming the country's economic growth; this was a low percentage relative to the sample as a whole even if not low in absolute terms. Obviously the crucial factor in the determination of group attitudes was the kind of relationship that core group members had with the immigrant communities, not the fact of proximity by itself.

In general, trade union leaders, Kenya People's Union (KPU) spokesmen, and Kenya African National Union (KANU) parliamen-

TABLE 3. AFRICAN ATTITUDES: PERCENTAGE OF THOSE WHO REPLIED THAT EUROPEANS AND ASIANS HARMED THE DEVELOPMENT OF KENYA (N = 653)

Community Affected	True	False	Don't Know; No Answer	Total
Europeans	13%	84	3	100%
Asians	45%	49	6	100%

tary backbenchers were the most prominent champions of the public's equity demands.¹² On frequent occasions they called upon the government to act more vigorously in righting past racial imbalances. To this end, they sponsored a race-conscious definition of Africanization, sought effective controls over employment opportunities in Kenya, and urged the authorities to scrutinize applications for citizenship with greater care. All these objectives were interrelated. As Clement Lubembe, the former secretary-general of the Central Organization of Trade Unions, declared: "It is our contention that granting of citizenship must be made to look as expensive as possible so that, as time goes on, we should be able to adjust the existing imbalance."¹³ Thus, the government was constantly exhorted by these parliamentary and trade union leaders to move ahead faster in achieving its Africanization goals; the politically mobilized segments of public opinion remained deeply dissatisfied, and political stability necessitated substantial progress in meeting these African hopes and expectations.

Trade unionists and parliamentary backbenchers and opposition members, articulating their community's egalitarian impulses, tend to be skeptical of the government's more cautious estimation of the need for non-African skills. Although both governmental and nongovernmental spokesmen urge a policy of self-reliance,¹⁴ they differ noticeably when it comes to the practical task of implementing Africanization schemes.

For many an African nationalist, the attack on standards is an attack on the "colonial mentality." It is an attempt to eliminate the artificiality of European values as applied to African circumstances.¹⁵ During colonial times African

leaders voiced suspicions of high standards, seeing them as a means of restricting the common man's initiative. Thus, Tom Mboya criticized the standards maintained by municipal councils in the country in 1960 on the grounds that they inhibited healthy competition. He said:

My contention is that you cannot look forward to standards which you cannot afford, and especially if the policy is to encourage African business, I think we should be much more lenient and consider the nature of the people we are dealing with rather than merely fix standards and hope that everybody will maintain those standards, regardless of the means available and their capacity to achieve those standards. It has come to a point where some of us are convinced that, in fact, the reason for some of these restrictions on African petty traders, vegetable traders, second-hand clothes dealers and so on are being prevented from trade merely in order to meet . . . the interests, of those people who have the bigger voice in the City Council today—the Europeans, and to some extent, the Asians.¹⁶

And two years later, J. J. M. Nyagah urged a compromise in the standards applied to a veterinary diploma "even if it means we will produce a man who is lower than the present holder of a Makerere diploma . . ."¹⁷ At that time African politicians sought to break the dominance of non-Africans in the bureaucracy, the professions and business and were quite prepared to lower standards in order to increase African opportunity.

With the entrance of a number of Africans into high and middle-level positions after independence, the discussion of standards tended, in official quarters at least, to take greater account of the complexities of the question. African governmental authorities expressed pride in the post-independence period over their standards of excellence in the civil service;¹⁸ in addition, they tended more and more to discriminate between

¹² The Kenya Government proscribed the Kenya People's Union in October 1969 following a violent confrontation in Kisumu and the placing of a number of major party officials in detention or under house arrest.

¹⁸ In his Jamhuri (Independence) day address of 1967, President Kenyatta proudly asserted that: "Despite this rapid Africanization, there has been no fall in the standards of efficiency." *Kenya Newsletter* No. 25, December 15, 1967, p. 3. See also, Kenyatta, *op. cit.*, p. 242.

areas requiring and not requiring the highest of qualifications. Even so, trade unionists and parliamentarians continued the frontal assault on colonial-inspired standards. For many of these men, the question of standards was raised as a means of limiting African advance.¹⁹ As G. G. Kariuki told Parliament:

Why can we not give these jobs to Africans? What is the impossibility in Africanizing a clerk? What is the impossibility in Africanizing a job where a person just does nothing except counting motor-cars? Mr. Speaker, Sir, what is there in an executive job? What technicality is there in an executive job? What technicality is there in Africanizing, say, a branch manager of a bank?²⁰

These men were impatient to get on with the task of Africanization. They were contemptuous of what they considered as artificial standards set up to inhibit opportunity rather than to guarantee competent service. The "myth" of high standards, as one observer described it, was seen by many as essentially a damper on African aspirations for equity.²¹

On a related question, African nationalists have also attacked lack of experience as a bar to recruitment. Such a requirement is seen as reinforcing the status quo; it leads to an intolerable situation where Africans might be restricted indefinitely from entering certain occupations. Therefore African nationalist spokesmen have been wary of experience as an important prerequisite for a post and have argued that their followers need only learn on the job.²² "For anyone . . . to imagine that Africanization/Kenyanization should be sacrificed to the bogey of 'experience' . . . is sheer racist economic sophistry," Clement Lubembe has contended.²³

²² Statement by George O'Newlaw, general secretary of the African Kenya Civil Servants Union, *Daily Nation* (Nairobi), November 29, 1962, p. 4.

²³ *Sunday Nation* (Nairobi), June 2, 1968, p. 8. Also see his comments in *ibid.*, May 5, 1968, p. 4.

Government leaders have gone a considerable way toward accepting the argument that experience must not block Africanization programs. In an address to the Association of East African Industries, the Minister for Commerce and Industry, Mwai Kibaki, requested that local manufacturers appoint distributors who lacked the normal background of experience. The question of "know how" has been exaggerated, he contended; under circumstances prevailing in Kenya, he estimated that Africans could now successfully act as agents for 75 per cent of the distributing sector.²⁴ Government officials accept the demands of equity with regard to the Africanizing of manufacturers' distributors but at the same time use experience as a basis for refusing to Africanize more specialized activities.²⁵ Substantial disagreement only arises over the importance of experience in the decision to Africanize high-level positions.

In brief, then, a considerable body of African opinion feels that non-African skills are dispensable. As Africans have moved upwards to compete effectively as civil service employees, shopkeepers, artisans, tailors, and salesmen, they have become fully aware of the fact that competence is not the exclusive preserve of any particular race. This recognition has had the effect of redoubling the demands for equal opportunity in every sphere. And the impact of this egalitarian thrust can be seen both in the crumbling defenses of those seeking to preserve universalistic criteria²⁶ as well as in the government's sponsor-

²⁴ *East African Standard* (Nairobi), June 14, 1968, p. 1.

²⁶ In the period prior to and immediately after independence, non-Africans generally urged a policy of equal treatment under the law for all citizens. They rejected preferential treatment for the less favored majority community and pressed instead for property safeguards and recruitment policies which emphasized individual merit and achievement. By 1967, however, a significant minority had come to accept the logic of corrective equity. This conclusion is based on a separate survey of Asian businessmen conducted by this author and Peter Marris in Nairobi, Kiambu and Limuru in June 1967. Results are based on 281 completed questionnaires out of a total sample of 301, or a return rate of 93 per cent. In Nairobi and the Nairobi Industrial Area, a 10 per cent sample was obtained by means of street counting; in Kiambu and Limuru,

ship of such measures as trade licensing, work permits, land transfer controls, and loan schemes, some of which are discussed in Section III.

II. INPUTS: DEVELOPMENT DEMANDS

It is time now to turn to demands which not only act as supports for the political system but are also an essential concomitant of the drive for rapid economic growth. Because the effects of past racial inequalities of opportunity are still evident on the Kenya economic scene, these development demands are largely advanced by European and Asian businessmen and professionals. Nevertheless, this point must not be overstressed; many Africans are now assuming positions of importance in the private sector and these men are often just as aggressive as their non-African counterparts in pressing developmental priorities. Consequently, the conflict between equity and development demands is increasingly one of class interests, not simply of racial interests.

Not surprisingly, Kenya's lack of capital and skilled manpower has caused those concerned with development to be cautious about proposed schemes for rapid Africanization. They seek an expanding economy; any possibility that hasty or ill-conceived measures will be put into effect gives rise to anxieties, such as that the existing economic structure might suffer damage and the country's potential for expansion might be dimmed. Africanization is viewed as a desirable objective—even a sound business practice; yet in the eyes of these men it must remain compatible at all times with developmental goals. Sir Colin Campbell, the president of the Federation of Kenya Employers, has stated these general sentiments as follows: "We as a Federation wholeheartedly support the principle of citizens receiving job preference. . . . Our principal concern is that this process should be carried out with the minimum disturbance to the economy and without diminishing confidence in Kenya abroad."²⁷ Another employer, also espousing the

cause of Africanization, doubtlessly expressed the uneasiness of many colleagues when he referred simultaneously to "inefficiencies resulting from haste, emotion, and the throwing about [of] bad words."²⁸ Africanization, then, was considered a political necessity for business leaders. They sought to accommodate the grassroots pressures for equity within a framework of high standards and efficiency—in other words, to bring Africans into the cosmopolitan world of industry rather than to adapt industry to African values and circumstances.

The limited nature of skilled manpower resources for developmental purposes is evident to most observers of Kenya. That country's modernization, like that of the third world generally, is held back by what the late Tom Mboya described as "a gigantic shortage" of trained and experienced personnel.²⁹ Kenya's manpower shortages do not exist in every category; a substantial balance (or surplus) between supply and projected demand exists in such occupations as forestry officers (technician level), agriculture and livestock technicians, medical technicians, and radio communications operators.³⁰ However, as Table 4 indicates, shortages of middle and high-level manpower are significant, particularly in such occupational categories as engineers, doctors, teachers, librarians, lawyers, geologists, pharmacists, surveyors, accountants, and architects.³¹ Kenya lags behind such countries

as Nigeria where a surplus of civil engineers, lawyers and accountants is anticipated by 1970 but well ahead of a number of countries in tropical Africa whose projected out-turn of secondary school and university graduates is so small as to leave them extremely dependent on nonindigenous skills.³²

Although Kenya's manpower gaps may be filled in time by the educational system, the process is likely to be influenced by a variety of factors: the rate of the economy's expansion, the adequacy of the educational system to deal with future needs, the willingness of the population to support the necessary educational system, the level of wastage, and so forth. Clearly non-Afri-

cans, citizens and noncitizens alike, will be essential in many industries, for the foreseeable future. A premature departure of expatriates would retard development and create additional unemployment. An inkling of this came in the fall of 1967, when the exodus of many Asian artisans at the time of a building boom added to costs and caused delays. Asian artisans had been leaving Kenya since 1960 in order to find better employment opportunities elsewhere; this steady manpower drain, intensified by fears in 1967 over an early end to any chance to enter Britain, caused a drop in the numbers of skilled construction workers from 21,120 in 1960 to a low point of 9,000 in the fall of 1967.³³ As a result business firms and home builders waited longer and paid higher prices for construction.

Moreover, any future employment policy which might distinguish between citizens on racial grounds would prove expensive in terms of economic growth. Not only do non-Africans long resident in Kenya have a substantial share of existing skills, but present educational trends indicate that their potential role remains large in the highly-skilled occupations. Only 38 out of the 98 Kenya students graduating from the University College, Nairobi, in the years 1963-1966 were of African origin, the remainder consisting of 59 Asians and one European. Asian preponderance was particularly noticeable among those receiving degrees in engineering, for 88 per cent of those receiving degrees from this faculty were of Asian origin.³⁴ Statistics compiled by the University College on student distribution by race in 1967 show that 180 of the 557 students from Kenya (32 per cent) were Asians and 29 (5 per cent) were Europeans. A breakdown of these figures by faculty (Table 5) gives some insight into the important part non-Africans will play in the years ahead in such fields as design, land development, engineering, and the sciences. When the number of Kenyans of European and Asian origin studying abroad is added to those at the University College, a picture of significant non-African contribution to the country's manpower supply situation is evident. Under such circumstances, any change in recruitment policies that would make it less feasible for locally

and overseas trained out-group members to participate fully in nation-building would obviously involve a significant economic cost.³⁵

Leaders in government and industry, aware of the scarcity of manpower resources, have taken development demands into account in formulating policy. Highly-placed persons in business and commerce, most of whom are non-Africans, have naturally found it relatively easy to argue for a nonracial hiring policy. But African politicians, torn by their desire to represent the wishes of their constituents and by their recognition of the need to cushion the impact of Africanization, have reluctantly become the proponents of prudence and responsibility. Noting that the paucity of scientific, technical, professional, and managerial skills constitutes a major handicap to Kenya's development efforts at this stage, Tom Mboya, for example, argued for a selective and detached approach to the problems of manpower planning.³⁶ Similarly, the paper on African Socialism is most sensitive to the problems of manpower shortages:

As with capital, we can grow rapidly now only by supplementing our meagre supply of domestic, trained manpower with large numbers of skilled people borrowed from abroad. It is a choice between rapid growth and little or none, not between rapid growth and a little less.³⁷

³⁶ *East African Standard* (Nairobi), December 5, 1966, p. 7. For comments on the need for expatriate teachers, see Eric Khasakhala's remarks as reported in *ibid.*, March 6, 1968, p. 9.

³⁷ Republic of Kenya, *African Socialism and its Application to Planning in Kenya* (Nairobi: Government Printer, 1965), p. 21.

Despite the genuineness of their nationalistic inclinations, therefore, Kenya's rulers went far toward accepting the development demands on the utilization of non-African manpower; as indicated below, they have moved cautiously to implement the provisions of the Immigration Act of 1967, encouraging the continuing expansion of the economy by a policy which assures a ready supply of trained and experienced personnel. The alternative was seen as an equity of the many poor where Africanization would take place at the expense of growth—a situation regarded as thoroughly undesirable.³⁸

African leaders outside government were also highly sensitive to the constraints of the supply situation. Many parliamentarians of both parties recognized that a "skill drain" would intensify existing personnel shortages, thereby delaying development. An outspoken critic of the government's policies aimed at driving out the Asian middle class was the militant nationalist and leader of the Opposition, Oginga Odinga. He charged that the government's policies were "sacrificing the Asian" to relieve economic and political pressures on itself; the struggle for economic independence, he said, would require full use of all the manpower available in East

³⁸ *Ibid.*, p. 18. In reconciling African Socialism with the ownership of a Mercedes-Benz, Tom Mboya spoke as follows: "If we are going to have African managers and professionals, we have a responsibility to create the atmosphere in which they operate. There has always been serious misunderstanding by those who think that African Socialism means equitable distribution of poverty. To me, however, it means equitable distribution of wealth." *East African Standard* (Nairobi), May 26, 1969, p. 5.

Africa.³⁹ Odinga expressed anxiety over the exodus of Asians from Kenya, fearing that it would leave a trail of African unemployment in its wake:

The Asians might be leaving today, but do we have any plans in connection with this, because the Asians who were here were employing some Africans? When they leave, these Africans will also be jobless men in the streets, and who is the person who will take the chance? It may be some of the non-Africans who have, by chance, become citizens of this country, who will take the chance of filling these places, because they have the funds to expand in business. It will only be the big salaried African, who also has money, probably only Africans who have farms, who will also fill these places. Such a person may be able to employ those Africans who are now jobless as a result of these people going, but will it really solve the problem of the jobless people who are roaming our streets?⁴⁰

In making this statement, Odinga had not altered his position regarding the need for rapid Africanization or preventing exploitation by foreigners;⁴¹ rather he was pointing to the Africans' economic interest in keeping skilled non-African manpower available for Kenya's uses. He stressed the desirability of creating a planned, socialist society, not the replacement of a non-African by an African privileged elite.

In brief, then, it is an oversimplification to contend that the demand for non-African skills is exclusively a non-African one. Africans in government and its opposition as well as in business and the professions urge the exercise of considerable discretion in determining immigration and recruitment priorities. They recognize that non-African manpower makes an important contribution to development, and, in many cases, shun Africanization programs which would jeopardize economic growth. Thus Africans also press support for development demands; however, they tend to deem that a mutuality of racial interests is present where the employment of highly skilled non-Africans does not delay Kenyanization and where it increases economic opportunity for the people of the country as a whole.

Another of the development demands involves

³⁹ *East African Standard* (Nairobi), February 23, 1968, p. 17.

⁴⁰ *National Assembly Debates* (Kenya), Vol. XIV, Sixth Sess. (March 5, 1968), col. 386.

⁴¹ *Ibid.*, Vol. XIII, Fifth Sess. (November 7, 1967), cols. 1809-1810, and *ibid.*, Vol. XII, Fifth Sess. (July 28, 1967), cols. 2927-2930.

the conditions for the use of private capital. Not surprisingly, such support demands come mainly from the communities having private capital at their disposal—the Europeans and Asians. Here European leadership is particularly noticeable. The presence during colonial times of a sizable European population devoted primarily to agriculture and administration created the basis for a viable manufacturing sector; because of this concentration of European expatriates, the British invested more substantially in Kenya's large-scale industries than they did in most of their other tropical African dependencies. This process led ultimately to a tight British hold over Kenya's industrial life which remained in effect even after independence had been granted. The extent of this hegemony is revealed by the preponderance of European (mainly British) capital invested in previously registered companies. In the years 1963-64, for example, European-controlled companies increased their capital by £11,091,670; comparable statistics for the other communities were £920,250 invested in Asian firms, £26,000 in African companies, and £3,481,000 in partly European, partly Asian, and partly African-controlled companies.⁴² A large amount of European capital was also invested in newly incorporated companies around the time of the transfer of power and after. From 1963 to 1966 the nominal capital each community invested in companies under its control was as follows: European, £9,150,440; Asian, £5,329,625; African, £1,788,325; and mixed, £4,616,250.⁴³

In addition, as a report prepared by the Working Party of the National Christian Council of Kenya demonstrated impressively, British capital is heavily entrenched in the most crucial industries in the economy.⁴⁴ A high proportion of major Kenya companies are subsidiaries of London-based companies which are on the London *Times* list of the 300 largest British firms of 1967. The London-based firms with subsidiaries in Kenya include such well known industrial names as Unilever, Dalgety, Mitchell Cotts, Brooks Bond, J. Lyons, Glaxo, Great Universal Stores, Unigate, British Leyland Motors, International Computers, "Shell" Transport and Trading, British Petroleum, Metal Box, I.C.I., British Oxygen, and a number of others. Kenya's association with such powerful industrial giants gives it an important potential source of development capital—a decided advantage at a

⁴⁴ National Christian Council of Kenya Working Party, *Who Controls Industry in Kenya?*

time when this factor of production is in scarce supply. However, such an advantage may involve risks for a new nation determined to pursue a course of nonalignment. Moreover, the demands of large industry to repatriate profits, locate plants, set prices, and bring mergers into effect may run counter to the objectives of a nationalist regime. Those who control capital clearly make heavy demands upon government for a favorable climate for their investments.

Government, for its part, has given every consideration to the demands made by investors. It has given repeated assurances against appropriation and nationalization;⁴⁵ of particular significance in this regard is its enactment of the Foreign Investments Protection Act of 1964 which guarantees that:

No approved enterprise or any property belonging thereto shall be compulsorily taken possession of, and no interest in or right over such enterprise or property shall be compulsorily acquired, except in accordance with the provisions concerning compulsory taking of possession and acquisition and the payment of full and prompt payment of compensation contained in section 19 of the Constitution of Kenya. . . .⁴⁶

In addition, it has placed minimal controls upon investors and has promptly issued Approved Status Certificates to legitimate foreign companies seeking permission to repatriate profits.⁴⁷

Kenya's governmental leaders, then, are fully alert to the needs and demands of the investor community. Unlike neighboring Tanzanians who assume that Africa must create most of its own capital out of its own resources,⁴⁸ they place great store by foreign private investment as a catalyst of development. The *Development Plan, 1966-1970* projects that private capital formation will consist of £180 million out of a total £325 million during the period from 1965-70, the larger percentage of these private development funds coming from foreign sources.⁴⁹ In certain areas (manufacturing, mining, electricity

and water, hotels and restaurants, and nonresidential construction) the dependence on the private sector is virtually complete.⁵⁰ For KANU spokesmen, private capital is an essential requisite of economic opportunity in their country. They seek to deal with the problem of unemployment through the long-term process of expanding commercial and industrial opportunity. Private capital is welcome provided that it actually fosters the development process. "If we have [and attract] capital," reasoned Kenyatta, "we shall have more business opportunities and employment in the country for our people."⁵¹ He and his colleagues were willing to accept the risks implicit in close links with the Western capitalist economy in order to achieve the necessary framework within which a meaningful self-reliance will be possible.

In various quarters in Kenya, suspicion is rife of this close connection with international capitalism. The debate in parliament over the Foreign Investment Protection bill showed many members to be uneasy over the possibility of manipulation by foreign capitalists and resentful of the need to give broad assurances to foreign interests. Bildad Kaggia, who subsequently became Deputy President of the Kenya People's Union until he left the party in August 1969, was particularly outspoken on this occasion. The right of certain firms to repatriate profits under the provisions of this bill would mean, he said, "that we are not getting investment in this country for our own benefit, but we are only becoming some economic colony for America and Britain."⁵² In its 1966 election manifesto, KPU went on to condemn "the Government's and KANU's capitalist policies" and promised to "extend national control over the means of production and break the foreigners' grip on the Economy."⁵³ Since such a world view has set-

⁵⁰ In the manufacturing sector, for example, £53 million out of a total of £61.7 million is to come from private sources. *Ibid.*, p. 111.

tracted much support in other lands, it stands to reason that the government's extensive reliance upon private capital's contribution to economic progress must demonstrate results or other approaches, such as radical nationalization, may be seen as more desirable by the uncommitted citizen of present times.

III. THE DETERMINATION OF POLICY

In a modernizing state such as Kenya, government inevitably plays an active role as it goes about the task of processing the equity and development demands. Like other governments the world over, its freedom of action is circumscribed. The limitations of Kenya's resources and environment as well as the somewhat conflicting pressures of ideology make the processing of these inputs a sensitive and complicated affair. Yet despite the impact of these factors, the Kenya government still retains considerable capacity to make independent decisions with respect to Africanization goals, costs, and regulations.⁵⁴ As a consequence the political elite is in a position to exercise some discretion in determining Kenya's priorities on equity and development. How has it used its power?

To answer this question it is necessary to look at policy. The objective of eventual Africanization is adhered to uniformly across the continent, but the policies of the different African regimes have sanctioned varying priorities and controls. African regimes may be dichotomized crudely but usefully in terms of their characteristic policy-making processes. One type would consist in regimes such as Kenya with reforming policy-making styles; another type would include regimes such as Tanzania with radical policy-making styles.⁵⁵ Although a greater differ-

ence is often evident in the ideological orientations of these African regimes than in their actual performance in the face of similar environmental constraints, the ordering of priorities still has considerable significance for their developmental programs.

The Kenya government's great emphasis upon developmental objectives was made explicit in its White Paper on African Socialism. The "most important" of governmental policies, this paper asserts, "is to provide a firm basis for rapid economic growth. Other immediate problems such as Africanization for the economy, education, unemployment, welfare services, and provincial policies must be handled in ways that will not jeopardize growth."⁵⁶ In order to secure development, they plan to harness the world economy to their immediate need for capital and skilled manpower.⁵⁷ They are convinced that for the time being at least their nation's developmental interests are best served by preserving close links with international (especially British) Capitalism. As President Jomo Kenyatta has stated so clearly, "My Government has now no intention of amending or disrupting a system which is working well."⁵⁸ Such a heavy stress on

Jr. (eds.), *Political Parties and National Integration in Tropical Africa* (Berkeley: University of California Press, 1964), pp. 5-6; Robert C. Good, "Changing Patterns of African International Relations," this REVIEW, LVII (September, 1964), 632-634; Samir Amin, *Le Développement Du Capitalisme en Cote D'Ivoire* (Paris: Les Editions de Minuit, 1967), p. 265; Immanuel Wallerstein, *Africa: The Politics of Unity* (New York: Random House, 1967), Ch. XI; and Frantz Fanon, *The Wretched of the Earth* (New York: Grove Press, 1963), pp. 77, 99-117.

⁵⁶ *African Socialism and Its Application to Planning in Kenya*, p. 18. "Rapid economic growth, in all countries," commented Tom Mboya, the late Minister for Economic Planning and Development, "is a prerequisite to the extension and intensification of welfare services and to the provision of greater employment opportunities." *House of Representatives Debates* (Kenya), Vol. IX, Second Sess. (May 4, 1965), col. 1794.

⁵⁷ Speaking of the overseas investor, Kenyatta observed: "We must continue to merit and to encourage these injections of capital in the private sector. . . ." *East African Standard* (Nairobi), May 2, 1968, p. 5. See also J. G. Kiano's statement in *ibid.*, September 19, 1966, p. 4; and Tom Mboya's in *ibid.*, January 19, 1968, p. 1.

⁵⁸ *Sunday Nation* (Nairobi), February 18, 1968, p. 1. According to a former consultant to the Kenya government, ". . . the private sector has exceeded

KPU's militancy did not blind it to the contributions of immigrants capital and skill. In 1966, KPU President Oginga Odinga stressed that in the process of transforming Kenya's economy, KPU would try to see that justice was done to those immigrants who arrived in Kenya with the capital and skill which developed "the islands of prosperity already described." *East African Standard* (Nairobi), August 10, 1966, p. 3.

⁵⁴ For David Apter, government can be treated as an independent variable insofar as it changes the character of modernization. He observes: "It is in industrial societies as distinct from modernizing ones that government as an intervening variable comes to prevail." See his book, *The Politics of Modernization* (Chicago: University of Chicago Press, 1965), p. 252.

⁵⁵ For variants of the radical-reforming dichotomy, see James S. Coleman and Carl G. Rosberg,

developmental objectives has not been without its effects. Kenya, with an average annual growth rate at constant prices of over five per cent, has achieved a level of economic development which is admired in much of independent Africa.

It must be stressed, however, that a policy of extensive reliance upon foreign resources does not imply satisfaction with the status quo. Such is not the case. Kenya leaders are reform-minded, intent upon applying humanistic values to the capitalistic system. They seek to use the strengths developed under a capitalist order to advance African opportunity, not be used by the system. Hence they have made what could be described as a calculated "time-investment" in the existing order. They are deferring some of the equity demands until a later date, hoping through this sacrifice to achieve a more favorable future reconciliation between equity and development.

Kenya has given expression to its reforming approach in its policy of African Socialism. The Kenya interpretation of African Socialism seeks to join the nationalist demand for African opportunity with the continuation of the capitalist system. It is a reformist doctrine because it attempts to Africanize capitalism, not to proceed toward classical socialism. Although future programs involving the nationalization of commerce or industry are not ruled out, such programs are delayed in order to spur present growth objectives. "It should be recognized," reasoned the White Paper on African Socialism, "that if the nation's limited domestic capital is used to buy existing land, livestock, buildings, machinery and equipment, the nation has no more productive assets than before—only their ownership has changed. What may be lost are the new resources that could have been purchased instead. . . ."⁵⁹ Of course such an interpretation could change with new and different ways of perceiving priorities.

For the time being at least, government is determined to bring about a smooth and effective

expectations in both capital spending and self help effort." Edgar O. Edwards, "Development Planning in Kenya Since Independence," *East African Economic Review*, 4 (New Series) (December, 1968), p. 9. The percentage rates of growth of the gross domestic product in the 1963-67 period were estimated as 7.4 per cent at current prices and 5.3 per cent at constant prices. Republic of Kenya, *Economic Survey 1968* (Nairobi: Ministry of Economic Planning and Development, 1968), p. 7.

⁵⁹ *African Socialism* . . . , p. 26. Also see Duncan Ndegwa's argument in *Daily Nation* (Nairobi), August 1, 1968, p. 13.

transfer of economic power into African hands.⁶⁰ "In general," remarked the late Tom Mboya, ". . . Africanisation of the various sectors of the economy will be pursued through a framework of growth, i.e., by enabling Africans to own new assets."⁶¹ The emphasis is upon steady and continuous progress toward "substantive rewards."⁶² Clearly the present administration does not intend to force the pace of Africanization beyond the point which the public or private sectors can absorb without a loss in efficiency or productivity.

Evidence of such pragmatism is readily at hand. One example may be inferred from the implementation of the Trade Licensing Act of 1967 which imposed some restrictions on noncitizen commercial activities. In the debate on the bill, Mwai Kibaki, the Minister for Commerce and Industry, stated that the government would consider scheduling a township under the Act when, after consultations with the county council, administration and local leaders, it had determined that there were enough local people ready to take over the businesses presently run by noncitizens.⁶³ The emphasis was upon "phasing out" the change so as to avoid costly disruptions.

When the new law came into effect, government leaders continued to stress that the transition to African dominance in the field of trade would have to take place gradually. Kibaki told a press conference in January, 1968 that the law would be applied "in a reasonable manner." Noncitizens would be removed from areas only as quickly as Africans were prepared to assume the new responsibilities.⁶⁴ In subsequent months,

⁶⁴ *East African Standard* (Nairobi), January 12,

as members of the Kitale Municipal Council sought to include their township as one of the general trading areas open to noncitizen businessmen, the Minister issued a statement reassuring peoples dependent upon non-African services that no arbitrary or ill-conceived actions were contemplated.⁶⁵ Even as a stricter application of the regulations was considered in the latter part of the year, the government remained determined to see that non-Africans stayed on in their shops until an "efficient African" became available.⁶⁶ In principle, the government preferred to delay Africanization objectives where these clashed head on with business efficiency. To the extent that the priorities seemed to have changed in early 1969, this may be attributable as much to a judgment about the manpower supply situation as to the political objectives involved.

Not only are governmental officials pragmatic in their implementation of the Trade Licensing Act, but they are also careful to delineate the kinds of activities affected by the Act. As Kibaki noted in the debate on the bill, the Trade Licensing Act would apply only to trade licenses, not to manufacturing licenses.⁶⁷ His comment is indicative of the tendency on the part of government to give greater encouragement to African commerce than to African industry.⁶⁸ Apart from restrictions on noncitizen trading licenses, African traders have also been helped by redirection of commodity distribution through the Kenya National Trading Corporation. By contrast, African industrial businesses receive no preferential treatment. African sawmills have great difficulty in getting any timber allocations from the Forest Department, which gives them mostly to Asian and European mills. Government departments put their requirements out to tender with strict impartiality, and they drop African firms if they obtain a more competitive bid elsewhere. Government does nothing to restrict competition from European and Asian

companies, even when they threaten to drive African firms financed by government loans out of business. Clearly the government regards industrial growth as too urgent a matter to compromise growth rates by favoring, too strongly, the small beginnings of African entrepreneurship. It wants overseas private firms to invest large sums, thereby helping to build an industrial base. Government is then likely to Africanize gradually, perhaps pressuring firms to sell shares to the public or to appoint African directors and senior employees.

Finally, pragmatism is evident in the way in which government issued work permits. Following the passage of the 1967 Immigration Act, officials in the Ministry of Home Affairs gave assurances to noncitizens that they need not panic about securing the new work permits. No abrupt changes were intended; the Immigration Department would not act with undue haste as it called classes of people forward to apply for work permits.⁶⁹ Other signs of governmental caution came to light in the following year. Immigration officials announced further periods of grace in regard to work permits, allowing employers who had not been informed of the results of work permit applications to continue to employ their staff until informed otherwise.⁷⁰ In addition, the Minister for Home Affairs, D. T. arap Moi, gave assurances to international companies about their key employees, and farmers were told by various officials that their applications for permits would be processed swiftly.⁷¹ By September, 1968, it was announced that 8,000 of the first 9,000 applications submitted had been approved—a proportion sufficiently generous that the U. K. Citizens Committee could talk of evidence of a slackened speed of Africanization!⁷² Thus the government's over-

riding concern with the health of the economy led to only a gradual implementation of the regulations on work permits in the early period after the passage of the immigration law.

In contrast, Tanzanian leaders placed great stress upon equity objectives in the period following the Arusha Declaration of 1967. The principles set out in the second five-year development plan—social equality, Ujamaa (familyhood), self-reliance, economic and social transformation, and African economic integration—indicate the strength of their commitment to egalitarian objectives.⁷³ Such priorities coincide with doubts about attracting sufficient external resources for rapid industrialization. "We are mistaken," observed President Julius K. Nyerere, "when we imagine that we shall get money from foreign countries; firstly because to say the truth we cannot get enough money for our development; and secondly, because even if we could get it, such complete dependence on outside help would have endangered our independence and the other policies of our country."⁷⁴ Continued reliance on Western finance is seen as offering no escape from colonial inequities, for development along capitalist lines will result at best in marginal benefits for the great majority of the impoverished local population. To end the drift toward what they see as "economic dependency,"⁷⁵ the Tanzanians have adopted a policy of socialism and self-reliance. They have created a sense of crisis in the populace by focusing on the unpredictability and unfriendliness of the international environment in order to mobilize the populace and reduce their dependence on external sources of capital and manpower. Nyerere's formula runs as follows:

... And the truth is that our United Republic has

(September 23, 1968), col. 1071. In July, 1969, J. H. Gitau, the director of the Kenyanization of Personnel Bureau, commented that more than half of the 18,000 applications for work permits received from noncitizens had been approved. *East African Standard* (Nairobi), July 4, 1969, p. 5.

at present a poor, undeveloped, and agricultural economy. We have very little capital to invest in big factories or modern machines; we are short of people with skill and experience. What we do have is land in abundance and people who are willing to work hard for their own improvement. It is the use of these latter resources which will decide whether we reach our total goals or not. If we use these resources in a spirit of self-reliance as the basis for development, then we shall make progress slowly but surely. And it will then be real progress, affecting the lives of the masses, not just having spectacular show-pieces in the towns while the rest of the people of Tanzania live in their present poverty.⁷⁶

Nyerere is willing if necessary to accept slow progress for the sake of independence from the grip of Western capitalism. To this end, he calls for rural development, a complete overhaul of the educational system, and a variety of puritanical measures aimed at eliminating luxury and ostentation. He rejects industrial development based essentially upon foreign initiative even while welcoming alien capital and skills which are willingly contributed toward fulfilling the government's objectives of building a socialist state. The 1969–1974 Development Plan reflects these priorities by forecasting a private sector investment of diminishing importance relative to other sources, crucial only in housing, road transport and construction.⁷⁷

Ultimately, African radicals such as Nyerere can be said to value collective action and equity more than economic growth. They and their supporters ridicule what they describe as "perverse growth," namely economic expansion on African soil which benefits international capitalism more than the local economy of the developing state.⁷⁸ Their radicalism lies in altering their relationship to the international order that they inherited and in attempting to mold an economic arrangement geared to circumstances of

their own making. Their stress upon rural development and Ujamaa villages as well as their de-emphasis of wealth are indications of this new assertiveness.⁷⁹ In seeking to determine their own order, they naturally rule out or greatly minimize such reminders of old times as extensive concessions to the development demands put forth by foreign interests.

IV. POSSIBLE CHANGES IN KENYA'S PRIORITIES

Kenya's attempt to strike a balance between demands for Africanization and for optimum economic development was one among several strategies for building a political order in the immediate period after independence. For Kenyans, an imbalance of emphasis in the direction of racial equity might have achieved social justice at a possible cost in growth. An imbalance in the direction of all-out economic development would have involved social costs in terms of African opportunity; the class-racial gap between the privileged non-Africans and the underprivileged Africans might have widened, leading to a dramatic escalation of frustrations in the period just after the transfer of power had occurred. The reconciling of somewhat conflicting demands was a delicate operation at best, but it seemed to Kenya's rulers to promise significant advantages in securing a balanced development.

The transfer of political sovereignty had little initial impact upon non-African hegemony in the economic sphere; Europeans and Asians continued to predominate as a consequence of their hold upon essential skills and capital. Conscious of the increased exposure of their position resulting from the loss of political power, however, they were prepared to accept—even help guide—a limited adjustment in the economic order. They sought to co-opt some trained Africans into the free enterprise system, thereby cooperating with the government's goal of creating African opportunity within the inherited capitalistic arrangement.

Nevertheless the relationship of a strategy of development to intergroup relations must be viewed in a larger perspective than the unique response to post-*uhuru* circumstances. Development inevitably involves adjustments to changing internal conditions, specifically and currently increasing African pressures for equity at a time of moderate economic progress. With the passing of the initial postcolonial phase, unemployment has increased generally, dissatisfaction with income differentials has become more and more apparent, and the demand for Kenyaniza-

tion, if not "blackening," has become pronounced. "The people are unemployed everywhere," warned Masinde Muliro, "and this is material for disgruntled politicians. . . . Today we have revolutions in Africa because of disgruntled millions, and as long as ours is not yet disgruntled we should try to see how best we can remedy the poverty which is in our country."⁸⁰ The former Opposition party's, KPU's, attempts to capitalize upon such popular sentiments did not lead to major electoral successes; yet the appeals of its radical approach were evidently seen as a challenge during the Little General Election of 1966 and the 1969 by-election in the Gem constituency of Siaya District.⁸¹ Thus Africanization demands are being pressed with increasing intensity, and governments in developing countries, which have limited capability to cope with conflicting internal pressures, must make concessions to racial equity demands in order to ensure the persistence of the system.

Governmental priorities are likely to reflect changes in inputs in the years ahead. As equity demands grow, governments may be compelled to move in one of two main directions: to the "right" in the form of additional coercion or to the "left" in the form of more appealing radical strategems ranging from heavier taxation to nationalization. The first alternative would be evidence of the current elite's investment in the present order. It would attempt to secure a firm hold on the present situation by combining the necessary elements of force with a policy of co-opting as many able African graduates into high-level positions as the nation's development would permit.⁸² This approach would mean a

⁷⁹ *National Assembly Debates* (Kenya), Vol. XVI, Sixth Sess. (September 3, 1968), cols. 98-99. See also *East African Standard* (Nairobi), October 4, 1968, p. 17. For a discussion of Kenya's unemployed as a political pressure group, see Peter C. W. Gutkind, "The Poor in Urban Africa," in *Power, Poverty and Urban Policy*, ed. by Warner Bloomberg, Jr. and Henry J. Schmandt (Urban Affairs Annual Reviews, Vol. II; Beverly Hills: Sage Publications, 1968), pp. 388-392.

⁸¹ For a discussion of parochial as well as class factors in the Gem by-election, see John Joseph Okumu, "The By Election in Gem: An Assessment," *East Africa Journal*, VI (June, 1969), pp. 15-17.

⁸² This point was clarified in discussions with Professor Michael Lofchie. Moreover, as Ted Gurr notes, a regime's attempt to use coercive measures in dealing with widely perceived feelings of deprivation will necessitate the commitment of a high level of resources. "A Causal Model of Civil Strife: A Comparative Analysis Using New In-

⁷⁹ Editorial, *Nationalist* (Dar es Salaam), May 8, 1969, p. 4, and *Reporter* (Nairobi), November 14, 1969, p. 27.

continuing emphasis upon growth over social justice; the nation's development would be used to implement Africanization objectives to the extent compatible with development objectives. The second alternative, and one that appeals in Kenya to some KANU backbenchers as well as the detained KPU parliamentarians, involves a move to the "left" to preserve the government's legitimacy. This would entail a change in the existing balance in favor of racial equity demands, reducing growth rates for the sake of social justice. Such an approach would subordinate "economic interest," defined in terms of total growth rates, to "political interest," defined in terms of broadening and deepening the regime's base of legitimacy. This would be a not unlikely response to the changing nature of political pressures in the period after the victories of independence have been consolidated.

The implications of such revisions of priorities for racial minorities can be suggested only tentatively. A move toward the maintenance of the present system through additional coercion would likely mean that rich or highly-skilled

non-Africans would continue for the time being to perform a vital role in achieving the country's economic objectives. Their security of mind might be lessened by the administration's increasing reliance upon the instruments of coercion and the steady inroads on the membership of the non-African communities brought about by accelerated Africanization policies. The functionally-significant Asian or European would still have an important contribution to make to economic growth. However, a shift from present Africanization programs and reliance upon non-African capital to a radical formula more in line with the aspirations of the politically mobilized segments of public opinion would weaken the minority hold on economic life. It would divest them of a number of presently performed functions, and thereby undermine vital immigrant claims for inclusion in African polities.

In the large, the non-Africans' increasing marginality would be a consequence of the egalitarian tendencies implicit in the industrial-commercial ethos they helped to carry into Africa. And the race-consciousness that they fostered would further weaken their position by undercutting the kind of legal-contractual environment essential to their survival on the perimeters of primarily African communities.

dices," this REVIEW, LXII (December, 1968), p. 1124.

THE ROLE OF THE M.P. IN TANZANIA*

RAYMOND F. HOPKINS

Swarthmore College

The study of politics in "developing" countries has tended to focus on the less formal organs of government, such as political parties, the military, the bureaucracy, and even the educational system.¹ National legislatures have often been ignored or rated of little significance in the political processes of these states.² This practice contrasts markedly with the attention paid to legislatures in Western states. The most obvious explanation for it is that legislatures in new states tend to have little influence. Important decisions and shifts in power are usually made or recorded elsewhere in the political system.

The *Bunge*, or National Assembly, of Tanzania is no exception to this general phenomenon. Nevertheless, an examination of the role of M.P.'s in Tanzania can be illuminating.³ The *Bunge* contains most of the major political leaders and has, at least constitutionally, broad authority. As a consequence, if the Assembly is to

be only a weak political body, then informal norms limiting the powers of the M.P.'s role must exist. Moreover, these norms should prescribe authority relationships between the legislature and other policy shaping bodies in the political system, particularly the Party. Thus, an analysis of the roles of these men can provide important insights not only into the functions of the *Bunge*, but also into the elite political culture of Tanzania and the pattern of politics which this culture supports.

I. POLITICAL ROLES

Roles are basic analytical units of political systems.⁴ Political roles consist of a pattern of expected behavior for individuals holding particular positions in a system. In order to understand how a political culture operates so as to regulate not only overt activity but also to influence the pattern of ideas and subjective behavior, I have focused on a political role as the key agent of translation between the broad characteristics of culture and the discrete set of acts that constitute the political process. While some role expectations are always *ad hoc* and issue centered, others are of a general nature. The latter define general boundary rules of political roles, certain acts that are clearly wrong in the minds of most individuals. The institutionalization of rules in the political system is evidenced by a structured and interrelated set of norms for role behavior. Where these norms are weak or ambiguous, institutionalization not only of political roles, but of the political system itself, is at a low level.

The norms or rules shaping durable political roles involve system-level or macro processes. These norms determine the style and stability of politics in the system. This research, however, focuses heavily upon individuals and what has been termed microscopic role analysis.⁵ Carefully examining the norms for an M.P. allows us to combine a micro analysis of a role in which the behavior of individuals can be studied, with

*This is a revised and shortened version of a paper read at the African Studies Association meetings in Los Angeles in October, 1968. I am grateful to several colleagues at Swarthmore and elsewhere whose comments have been most helpful.

¹See for example the six volumes edited by the Social Science Research Council's Committee on Comparative Politics (published by Princeton Press, 1963-66) and Samuel Huntington, *Political Order in Changing Societies* (New Haven, 1968).

²One exception to this trend is Frederick W. Frey's *The Turkish Political Elite* (Cambridge, 1965).

³The concept of role, as used here, refers to all the principal aspects of a role: the expectations of others, the orientations of the individual occupying the position, and the actual behavior of the individual. The congruence and consensus among these role aspects is a major focus of my investigation. This essay assumes the reader is generally familiar with the concept of "role" as used in this sense. See for reference, Bruce J. Biddle and Edwin J. Thomas, editors, *Role Theory: Concepts and Research* (New York, 1966). One example of a study of legislative behavior which relied heavily upon role analysis as a tool of research to reveal patterns of politics in four state legislatures is John C. Wahlke, Heinz Eulau, William Buchanan and Leroy C. Ferguson, *The Legislative System* (New York, 1962).

⁴See David Easton, *A Framework for Political Analysis* (Englewood Cliffs, N.J.: Prentice-Hall, Inc., 1965), pp. 39-57.

⁵See Neal Gross, Ward S. Mason and Alexander W. McEachern, *Explorations in Role Analysis* (New York: John Wiley and Sons, Inc., 1958), Chapters 10-12.

a macro political analysis since the norms which operate to constrain the actions of the elite in this role are major components of the political culture and constitute some of the "rules of the game."

This study is based on interviews with M.P.'s and an analysis of their behavior in Assembly debates. It is divided into four sections: an examination of Assembly behavior, a characterization of various types of legislators, an exploration of role expectations for M.P.'s, and a conclusion. In the final section, four rules which emerge as basic norms for the role behavior of legislators are described and discussed. These rules elucidate a pattern of "closed" politics which characterizes the style of national politics in Tanzania.⁶

II. THE LEGISLATIVE ARENA

In 1961 Tanzania (then Tanganyika) became independent. Its constitution, modeled on the Westminster system, was replaced in 1962 by a new republican form of government with a popularly elected President. Again, in 1965, a year after the union with Zanzibar which officially formed Tanzania, another constitution was adopted. These changes brought formal legal codes closer to the actual patterns of decision-making which evolved after independence. A strong presidency has been established, and the Tanganyika African National Union, TANU, is now officially recognized as the only legal party.⁷ The National Executive Committee of TANU (NEC) and the President's Cabinet are the main decision-makers in Tanzania; however, many members of these bodies are also M.P.'s.

The National Assembly, though originally modelled on the British parliamentary system, has never evidenced similar patterns of legislative functions. The most important reason for this is that no significant opposition organized along party lines ever existed in the legislature. From the first elections in 1958/59, a *de facto* situation of one party dominance has existed. Party control was initially exercised through

prior meetings of Parliament at closed sessions of the TANU Parliamentary Party (TPP). Since all members of the National Assembly were in the TPP, these closed meetings were often the real legislative forum.⁸ In 1965, therefore, following the introduction of the one party state, the TPP was dissolved. Sensitive issues, however, are still discussed privately with legislators, and the government has not relinquished the notion of party discipline.

Assembly Behavior. Although their work in informal discussions, committee meetings (which are private), tours of their districts, meetings with constituents, and collaborations with members of the government are all important aspects of legislators' behavior, Assembly speeches are the only aspect of role behavior readily susceptible to systematic study. Assembly voting is only recorded following a call for a division, and there was only one division—on a trivial matter—called in the first five years of independence (through July, 1966). Voting behavior, consequently, is not a fruitful field for research.

Therefore, in order to understand the role of legislators within the assembly, a content analysis of the actual debates was made. Speeches for five one-year periods beginning with October, 1961 (just prior to independence) and ending with the June budget session in 1966 have been coded. In all, 15,421 speeches were analyzed. Each speech was coded according to five characteristics: subject, national or local orientation, position vis-a-vis the government, language, and length.⁹ Since many short speeches were quick

⁶ One member, Chief Masanja, resigned from TANU to join the ANC in 1962. But this exception has proved unimportant.

⁷ All speeches in the 1961/62 and 1965/66 periods have been coded; approximately 50% of the speeches in the intervening three years have been coded. Twenty-eight different subject categories, many related to ministerial divisions, such as agriculture or education, were used in coding subjects. Orientation was either national or local. The position of a speech could be one of four types: supportive (of the government's position), critical, neutral (if the speech was balanced or there was no official government position), and "demand" question-answer. This last category was used for many of the short questions and answers expressing and responding to demands or problems, usually local, raised by backbenchers. The language was Swahili or English (or in a few instances, mixed). Three length categories were used: short (0 to 1½ minutes), medium (1½ to 7 minutes) and long (more than 7 minutes). The coding procedures and tests for reliability are reported in

⁸ This pattern of "closed" politics and the process by which it has developed are described in Raymond F. Hopkins, *Political Roles in a New State: A Study of Politics in Tanzania* (dissertation, Yale, 1968; Yale Press, forthcoming). References are to pages in the dissertation.

⁹ For a readable review of the national political history of Tanzania, see J. Clagett Taylor, *The Political Development of Tanganyika* (Stanford, 1963); and for an insightful analysis of the party and state machinery see Henry Bienen, *Tanzania: Party Transformation and Economic Development* (Princeton, 1967).

FIGURE 1. USE OF SWAHILI

questions and answers, and, therefore, different in quality from longer, more substantial contributions, speeches were also "weighted" for length, eliminating short speeches and counting long ones twice. Patterns among speeches document the trends in Assembly debate since independence.

Trends in Behavior. One striking trend is the introduction of "national" traditions. The quaintly irrelevant powdered wigs, still found in some African legislatures, were discarded in Tanzania in 1962. The Speaker, Chief Adam Sapi, adopted a traditional costume which he wore as Chief or Sultan of the Hehe. Western business suits have generally been abandoned in favor of more functional attire known as "national dress," which is a collarless shirt often worn with matching slacks. More important than these changes in dress has been the introduction of the national language, Swahili. Figure

1 charts the conversion of debates from English, originally the only official language, to Swahili, which became an additional official language in 1962. The use of Swahili has allowed many less well educated legislators to demonstrate articulateness and express their feelings in an idiom familiar not only to themselves but also to the vast majority of Tanzanians.

A second trend is the decline of speeches dealing with National issues. At the time of independence, a vast amount of legislation was placed before the Assembly. Major legislation in agriculture, education, local government elections, taxes, citizenship, and the new republican constitution were all discussed and passed by the Assembly in the first year of independence. Ninety-six government bills were passed, forty-four based on certificates of emergency which allowed the requirements for prior publication to be waived. In the midst of these efforts, little time was left for discussions or questions related to local or regional problems. But as the pace of legislation slackened, discussion of local issues

Hopkins, *op. cit.*, pp. 399-410. Inter-coder reliability indicated an average of over 92% agreement.

FIGURE 2. DISCUSSION OF NATIONAL ISSUES

FIGURE 3. SUPPORTIVE SPEECHES

increased. Figure 2 illustrates that while the large majority of speeches are still nationally oriented, there has been a fairly steady decline in the per cent of speeches on national issues, except for a slight upswing in 1963/64, possibly explained by a renewal of national concerns following the army mutiny in January, 1964, and the Federation in April 1964.

Coincident with the changes in nationally oriented speeches has been the decline in both supportive and critical speeches. Among "weighted" addresses, however, there has been a general increase in support for the government from 1961

until 1965 followed by a marked decline after the 1965 elections. This pattern in supportive speeches is exactly the reverse of the pattern for critical speeches (Figure 4). Criticism of government policies, particularly among long speeches, was frequent in the early debates of the Assembly. It dropped steadily after independence and by the 1963/64 session it reached a nadir, probably reflecting the emphasis on unity following the army mutiny and the sudden events surrounding the union with Zanzibar. Assembly debates, although never marked by an active or systematic opposition, reached a point

FIGURE 4. CRITICAL SPEECHES

during this period where the absence of criticism made sessions largely ceremonial, and, as one Member described it, "rather boring."

An important conclusion which may be reached by examining the careers of those M.P.'s who were most critical is that no Member should become identified with a pattern of opposition. Only a few Members during the first two years of independence gave critical speeches 50% or more of the time. None has since. Those who did included Tumbo and Mkello, labor leaders who were subsequently placed in detention; Masanja, who, never a serious influence in the Assembly, defected to the A.N.C. (a miniscule opposition party) and has since retired from politics; and Siyovelwa and Mbogo, who, though loyal TANU members, did not stand for reelection. Both were appointed Area Commissioners, but Mbogo has been removed and imprisoned for theft. Thus none of those who were clearly and consistently critical or who opposed the government in the first five years has survived as a popular politician or M.P. Comparatively frequent criticism by an M.P. is often an indication of political ambition. For example, three M.P.'s who were initially quite critical, Mtaki, Wambura and Mponji, were made Junior Ministers and regularly entrusted with defending the government. In 1966, all expressed satisfaction with their careers and hoped to continue in their positions.¹⁰ Two Englishmen, Short and LeMaitre, were also frequent critics. Both lost their seats in 1962 because they were not citizens.

In the new and expanded *Bunge*, elected in 1965, discussions have become considerably more lively. About every fourth or fifth speaker in the new Assembly who made a lengthy contribution was critical of the government. However, over twice as many speeches have been supportive. On balance, the legislative arena is still a forum in which the government's ideas and proposals are largely praised or defended and criticism is not systematic, let alone organized. Among those M.P.'s who were most critical according to the analysis of speeches in the 1965/66 period, nine had lost their Assembly seats for political reasons by December, 1968, either by virtue of having been expelled from the Party or due to political detention or exile.¹¹ Mwakit-

wange, for example, in July, 1968, accused the government of "tribalism," "nepotism" and slowing the pace of Africanization. He was expelled from the Party three months later.¹² Eli Anangisye, former Secretary of the TANU Youth League, and F. L. Masha, who had been national publicity secretary for TANU, were among those expelled.

The analysis of Assembly behavior indicates that while M.P.'s have adopted national dress and speech, thereby making the *Bunge* more of an indigenous institution, the role of the M.P. in the actual legislative process is quite minor. Seldom is legislation altered by committee or Assembly action. Although criticism of the government has increased following the 1965 elections, it tends not to be directed toward critical or sensitive matters,¹³ and those M.P.'s who have been noticeably or consistently critical tend to have had their political careers shortened.

to missing three sessions of the Assembly. Anangisye was in detention and Kambona in political exile. Kambona was not an Assembly critic, but in private he was often highly critical.

¹² See *The Nationalist*, July 11, 1968, and December 10, 1968, p. 1.

¹³ An analysis of topics discussed in the 1965/66 Assembly revealed that criticism and support were not evenly distributed. For instance, on many of the twenty-eight subjects into which speeches were categorized, not a single critical speech was given. The most heavily criticized legislative topics (in over ten per cent of speeches) were elections, housing and labor unions. In contrast, military affairs received no criticism and was supported in 76% of the speeches on the subject. This is in marked contrast to the first year of independence when only 40% of the speeches supported military policy and 28% were critical. The lack of criticism in these areas reflects pressures, not organized by any individual or even by the Party, but rather, generated by latent political norms which dictate that delicate and controversial subjects are either best avoided or commented upon only in a constructive manner.

A factor analysis of these debates in 1965/1966 revealed the most prominent dimension as a "Security-Sovereignty" factor including issues such as foreign policy, Party, constitutional matters, the military and questions of national unity. This factor explained 27.8% of the variance among the 28 subject variables. High loading subjects accounted for 20% of all speeches. The factor scores for legislators on this dimension correlated highly, .68 with a high frequency of supportive speeches. See Hopkins, *op. cit.*, pp. 229-230.

¹⁰ Mtaki, however, who had attracted attention by his flamboyant style and recitation of Marxist principles, retired from politics in 1967 to enter private business. Another frequent critic, Buhatwa, was also made a Junior Minister but he lost in the 1965 elections and became an administrator in the Ministry of Housing.

¹¹ Anangisye and Kambona lost their seats due

III. LEGISLATIVE TYPES

Individual attitudes of M.P.'s are, perhaps, the most instructive evidence as to the role which the political system in Tanzania is creating for legislators. In order to investigate the attitudes relevant to the legislator's role, a random sample of Tanzanian political elite was interviewed: 58 *Wabunge* (out of 184 then in the Assembly) and 50 high level government administrators. These interviews were conducted between April and August, 1966. The interviews with M.P.'s averaged about two hours each and covered a variety of topics, including the individual's background, his attitudes toward democracy and African socialism, his conception of his job as an M.P., and his expectations about what he or others would do in a number of hypothetical role situations.¹⁴

During the course of interviewing, I began to recognize several types of legislators. Later, by analyzing the sample carefully, four "types" of legislators were identified, based largely upon differences in career length, mode of selection, and the special obligation of those in government posts. Eighteen of the fifty-eight M.P.'s interviewed held positions as Ministers, Junior Ministers, or Regional Commissioners. Of these eighteen government members, fifteen began their political careers prior to 1958. This long involvement and the relative success of this group in politics resulted in my labeling these fifteen "Politicos." All but one served in the first parliament of independent Tanzania from 1960 to 1965.

The forty-three other legislators interviewed fell largely into three groups—"Locals," "Intellectuals," and "Silent Partners." Intellectuals were better educated, more widely read, more interested in politics as a profession and career, seem more intellectually involved with questions of national policy. Ten legislators met these criteria and nine were categorized as "Intellectuals."¹⁵ Of the remaining 33 legislators in the

sample, 26 were constituency representatives. Twenty-five were categorized as "Locals."¹⁶ Locals represented a constituency, were often from the majority tribe of their area and were usually born in their constituency. Six of the remaining seven legislators, three of whom are government members with short careers, have been labeled "Silent Partners." All of these members were appointed rather than elected to the Assembly. Their experience in the Assembly and in TANU (though not necessarily Zanzibar) politics was short, and one may conveniently think of them as quiet (for, as will appear shortly, they seldom spoke) supporters of the government, hence the title "Silent Partners." If more Zanzibaris had been sampled, this group would be larger.¹⁷

Table 1 contains basic background information on these legislative types. Differences in education, newspaper reading, type of membership, career length, and position in the government, all of which are quite different among the groups, illustrate the distinctions among these four types of legislators. Politicos and Intellectuals are the best educated and read. Except for the distinction of government membership, these two groups are the most alike. Politics is especially important for individuals in both of these groups. The greatest portion of their life activity is taken up with public matters, particularly meeting other politicians, talking and dealing with them. In contrast, Locals spend a greater portion of their time in home constituencies, often travelling and speaking with their fellow citizens or tending farms or businesses. Many Locals, while active in politics, were also occupied with some other employment prior to their election for the first time in 1965. Most Locals were born in their constituency while Politicos tend to be born outside of their constituency and not to be members of the major or majority tribe. Locals also tend to have won their seats by a narrower margin than either Intellectuals

¹⁴ Informal interviews with a number of other National Assembly Members, including Second Vice-President Rashidi Kawawa and Assembly Speaker Adam Sapi Mkwawa, were also used in this study. A statement of the interview format used in the interviews may be found in Hopkins, *op. cit.*, pp. 358-375. Those interviewed are not identified since anonymity was promised.

¹⁵ The term "intellectual" is applied in the general sense suggested by Edward Shils in his article, "The Intellectuals in the Political Development of New States," *World Politics*, XII (April, 1960), 329-368. In order to operationalize these distinctions, which emerged initially from subjective analysis of the interviews, legislators with college

degrees or post-secondary education and who read widely were selected as "Intellectuals." One M.P. with a college degree has been excluded from this typology because he did not fit the basic characteristics of either "Intellectuals" or "Locals." He did not represent a constituency, had not given a single speech in the National Assembly and had no interest in a political career. His work, in fact, often kept him out of the country.

¹⁶ The twenty-sixth, the Deputy Speaker, is the only nongovernmental member in the sample serving his second term. He was excluded from the typology.

¹⁷ The seventh legislator remaining, a National Member, did not fit this or any other category.

TABLE 1. BACKGROUNDS OF LEGISLATIVE TYPES

	Intellectuals (N=9)	Locals (N=25)	Silent Partners (N=6)	Politicos (N=15)	All M.P.s Interviewed (N=58)

or Politicos. Silent Partners have no established constituencies. Outside the Assembly their efforts are largely administrative, either as agents of the government or as Party officers.

Economic Views. The responses of the various legislative types toward questions about economic issues are reported in Table 2. Intellectuals and Politicos were least content with the present rate of change. Relatively large numbers in these groups favored either a slower or faster rate of change.

Moreover, not one of the Intellectuals expressed satisfaction with the term African Socialism as a "concept"; eight out of nine disliked it. In contrast, the other three groups indicated ambivalent support for the idea. Forty-seven per cent of the Politicos, two of the six Silent Partners, and thirty-two per cent of the Locals felt the term was a useful, helpful or clear expression.

The evident distaste among Intellectuals for "African Socialism" is reflected in the different emphasis with which they defined the term. Five out of nine defined it as true or scientific socialism and saw this as a positive or desirable goal; three interpreted it similarly, but evaluated it negatively. Only one Intellectual understood African Socialism as an outgrowth of traditional African practice and he opposed such a policy. Locals, in sharp distinction to Intellectuals, tended to hold the view that African tradition is the basis for socialism and they looked favorably

on this idea. Only two of the Silent Partners elaborated their views on African socialism—largely an indication of their unwillingness to assert themselves on ideological matters. Definitions among Politicos varied widely, but were closest to those held by Intellectuals.

These "economic" attitudes among legislators further indicate the similarity among Intellectuals and Politicos. Sentiments of dissatisfaction were expressed most often by individuals in these two groups. Thus, Intellectuals and Politicos differ largely in that Politicos are the successful politicians in high government posts while Intellectuals, as openly indicated by several, are eager to acquire the power of Politicos. Such ambition can have important consequences. Since these interviews were completed, *four of the Intellectuals have been expelled from the Party and three have been promoted to ministerial positions.*

Assembly Behavior of Legislative Types. The performance of these four legislative types in the Assembly provides further clues into the role behavior of various members. Different types of members behaved differently and this suggests they were responding to different expectations—fostered either by their own personality, by differentiated socialization or by special external constraints such as apply to Politicos who are in the government.

The distribution of legislative types according to the per cent of their own Assembly speeches

TABLE 3. ASSEMBLY BEHAVIOR OF LEGISLATIVE TYPES†

	% of each legislator's speeches in 1965/66				
	Intel- lectuals (N = 9)	Locals (N = 25)	Silent Partners (N = 15)	Politicos (N = 15)	All M.P.s Interviewed* (N = 56)
<i>Nationally Oriented:</i>					
0 to 59.9%	0%	36%	20%	27%	25%
60% to 79.9%	44	40	20	33	36

10% to 19.9%	67	32	0	27	32
20% and above	33	36	100	20	38
<i>Critical:‡</i>					
0 to 4.9%	0%	12%	60%	80%	36%
5% to 9.9%	33	40	40	7	28
10% and above	67	48	0	13	36
Locals/Politicos $X^2 = 18.6^{**}$					

† Speeches were broken into three roughly equal intervals among all 184 M.P.s.

* Two M.P.s interviewed gave no speeches.

** This Chi-square is significant at the $p < .001$ level, but see footnote 18.

‡ Supportive and Critical are only two of four possible categories for speeches with respect to the government's position. The other two are neutral and non-neutral question-answer.

which were nationally oriented, supportive and critical are reported in Table 3. Intellectuals are the most nationally oriented in their speeches, Locals the most locally oriented. Both Silent Partners and Intellectuals were supportive compared to Politicos who devoted the least per cent of their speaking time to defending or supporting the government. This relatively small proportion of time given by Politicos to government support is a strong indication of the generalized support which is expected and received from other M.P.'s, and which relieves Politicos of the need continually to defend government policy.

While the per cent of critical speeches given by M.P.'s is low among all legislators,¹⁹ Intellec-

tuals were the most critical group. Locals were also critical; few Politicos and Silent Partners were ever critical. However, two Politicos, both Regional Commissioners (a high Party and government post), are found in the highest third of those giving critical speeches. This deviation is one of the most striking instances of role ambiguity to be found among legislators. Most Regional Commissioners, including these two high scorers, were Members of the Assembly elected in 1960. As constituency representatives originally, their initial role behavior included making frequent critical comments on government positions. However, following their appointment as Regional Commissioners, a new set of role expectations was imposed. Ambiguities about their role were reflected in the differing interpretations given by the several Regional Commissioners interviewed. Four saw their principal function as legislators as similar to Ministers and Junior Ministers, namely, explaining and defending government policy. Two emphasized their spe-

equal groups. To do this, it was necessary to collapse critical percentages so that all those for whom 10% or more of their speeches were critical became the "most critical" group.

¹⁹ In most cases the N was too small to meet the standard requirements of an expected frequency of five in each cell for the X^2 test. Rather than collapse cell categories to avoid this, it seemed better to keep distinctions which I believed had analytical importance and to present only the appropriate X^2 's. However, many differences are large enough to be statistically significant if the cell size requirement were relaxed. See Hubert M. Blalock, *Social Statistics* (New York, 1960), p. 221.

²⁰ Members were divided into three roughly

cial responsibilities as representatives of the region for which they were Commissioner. One of these suggested his job was to "help the M.P.'s from my region explain our needs and problems." Finally, one Commissioner confessed that he felt unsure about his role obligations as an Assembly Member and simply did not know to what extent he was free to express his own opinions.

These ambiguities explain why the pattern of Assembly criticism among legislators is not more symmetrical. Although Intellectuals and Locals tend to be the most critical and Silent Partners and Politicos the least critical, personal predilections, previous role experience as a legislator, and ambiguity of role definitions—most noticeable among Regional Commissioners—account for interesting variations from this pattern. Deviants are frequently found in legislative assemblies; what is interesting is how well they fare.²⁰ In the case of the two Politicos who occasionally made critical speeches, both have lost their Assembly membership, though the shift of one of these men from his role as Regional Commissioner was into another important post.

IV. ROLE EXPECTATIONS

The role orientations of an M.P. in Tanzania are affected by both official statements and by the subjective views of other *Wabunge*. These role expectations form the norms which shape role behavior. Consensus among these expectations strengthens norms. Agreement between the dominant expectations among M.P.'s and the views expressed by government officialdom would indicate low conflict over "rules of the game." In order to explore the degree of agreement or conflict between official expectations and those subjectively held by M.P.'s, official statements and interview responses have been examined and compared.

Official Expectations. The role of a Member of Parliament as envisaged by President Nyerere involves three tasks: "1) To act as a bridge . . . between people and government for transmission of ideas; 2) to deliberate on new legislation; 3) to keep the government actively devoted to the people's interest by intelligent criticism."²¹ These views, as expressed by Nyerere in a speech to the newly elected National Assembly

in October, 1965, represent one important change in the official description of an M.P.'s responsibilities outlined by Nyerere in September, 1960, prior to independence: the abandonment of a right to criticize government policy at public or private meetings in his constituency.²²

Members have been criticized by national leaders for failing to play effectively at least two of the three aspects of their role. Nyerere reminded new legislators that one of the obvious lessons in the defeat of many incumbents in the 1965 elections was their failure to keep in touch with their constituencies, to find out what their problems were, and to help people to understand what was being done and why.²³ The other criticism directed toward Members by official channels has been their failure to make more than minimal use of their prerogative to criticize in the Assembly. The Commission which studied the establishment of a one party state, for example, wrote:

With a few notable exceptions, debates in the National Assembly have tended to be lifeless and superficial. Legislation of the most complex and far reaching kind is passed rapidly through all the stages without challenge to basic principles or careful examination of detailed provisions.²⁴

Nyerere felt it was "fortunate" that a few Members disregarded the 'Party line' from time to time to express their own views, even though they were rebuked for their lapse from Party discipline. According to his conception, questions of detail, timing and priority should be openly discussed and debated in a one party state.²⁵ In-

²⁰ As cited in Tordoff, "Parliament in Tanzania," *Journal of Commonwealth Political Studies* (July 1965).

²¹ Nyerere, "Address at the Opening of the National Assembly."

²² The report blamed practices inherited from the British more appropriate to a two party system, for the lack of vigor in Assembly debates. In the British party system, private party caucuses and party whips to enforce discipline were accepted procedures essential to maintain the unity upon which the party in power depended for its control of the legislative process. Thus the TPP and the National Executive Committee provided private forums for prior discussions of policy and legislative matters. These prior discussions, the report concluded, inevitably have "inhibited subsequent discussion on the floor of the house." *Report of the Presidential Commission on the Establishment of a Democratic One Party State* (Dar es Salaam: Government Printer, 1965), pp. 20, 21.

²³ Julius K. Nyerere, "Democracy and the Party System" (Dar es Salaam: the Standard Press, 1963), p. 6.

²⁴ Ralph K. Huitt has analyzed the costs of deviancy in the U.S. Senate. See his "The Outsider in the Senate: An Alternative Role," this REVIEW, 55 (September, 1961), 566-575.

²⁵ J. K. Nyerere, "Address at the Opening of the National Assembly after the General Election," (Dar es Salaam: Ministry of Information and Tourism, October 12, 1965), no pagination.

telligent criticism, according to Nyerere, "is vital." It is possible for Nyerere to envision circumstances in which the National Assembly might disagree with the National Executive of TANU or the government.

Occasionally there will be a division of opinion about the desirability of a particular piece of legislation. In such cases, provided that both sides are honest and are able to advance arguments to support their views, people will be better served by reconsideration of the proposal than by an automatic affirmative vote.²⁶

This view, however, leaves ambiguous the question of in what situations opposition would be legitimate. Moreover, Nyerere himself has affirmed that broader questions of policy should be the responsibility of the National Executive of the Party, and not subject to legislative debate.²⁷ Thus, according to "official" views, although the legislator may express criticism, it must be constructive, and not be in opposition to policies already decided upon by the NEC.

Legislators' Expectations. In order to see how close legislators' own role expectations were to the "official" ones, the sampled M.P.'s were asked to describe their responsibilities as a Member of the National Assembly. Their responses emphasized all the role duties contained in official expectations. A few even made specific reference to speeches by Nyerere or Second Vice-President Kawawa about their duties. One M.P., for example, an Intellectual, gave this explanation about his role:

For an M.P., there are three tasks, as the President stated in his speech last October. First, I must represent the electorate, get their ideas and bring these views to the Parliament and advise the government. Second, I must get something from the government for the people. And third, I can advise the government on my own ideas and criticize constructively.

This interpretation of the President's expectations is not quite complete, since it omits the obligation of an M.P. to work in his constituency explaining government policy, but it indicates the process whereby official expectations shape expectations of role incumbents.

Most respondents mentioned several different duties. The most frequently mentioned, by 77% of the legislators, was work within the constitu-

ency. Bringing constituency needs and demands before the government was the second most frequently mentioned role task. Two other aspects of the legislator's role, as lawmaker and as critic of the government, were mentioned rather infrequently by only 21% and 17% respectively. The different frequency with which these four tasks are mentioned is an indicator of the emphasis which the political system tends to place on these duties. Participating in the legislative process or being a gadfly of the government is seldom a part of legislators' own conceptions of their role. Much more important is their work in the constituency, explaining government policy, encouraging and helping in nation building activities, and carrying problems and complaints from constituents to the government. The role emerging for an M.P. in Tanzania emphasizes his function as a communicator rather than either a deliberator or law-maker.

Those M.P.'s who participate in decision-making do so largely in their special position as members of the government. Ministers, for example, are normally involved in the preparation of legislation which is fully drafted and published before most members ever see it. In response to the question: "What is the *most important* aspect of your work?," most Politicos and Silent Partners cited either being members of the government and hence involved in planning and directing government activity, or being high officials in the Party, responsible for organizing and directing Party affairs (see Table 4). Locals tended to stress their work with their constituents; 52% felt that explaining to their constituents government policy and national affairs was their most important task, while 24% mentioned promoting their constituency interests to the government. Even among Intellectuals, five out of nine (56%) mention constituency related activity, but of these, the emphasis is on promoting constituency needs rather than on defending government policies. Intellectuals also emphasized legislative work and criticism. The following are typical replies of *Wabunge* concerning the most important aspect of their role.

The pattern of expectations and role emphasis in these responses is generally compatible with official expectations. The lack of expertise and specialization among legislators and the weakly articulated performance of legislative committees was reflected by the few legislators who emphasized legislation or criticism as the main aspect of their role.

Role Consensus. Three open-ended questions about political contingencies were used as a measure of role consensus. Each question explored some aspect of a legislator's relationship to the total political process. Responses to these questions (by both the M.P.'s and high-level ad-

²⁶ Nyerere, "Address at the Opening of the National Assembly," p. 6.

TABLE 4. ROLE DEFINITION OF LEGISLATIVE TYPES

	Intel- lectuals (N=9)	Locals (N=25)	Silent Partners (N=5)	Politicos (N=15)	All M.P.s Interviewed (N=58)
<i>Most Important Aspect of Role:</i>					
Promote Constituency	33%	24%	0%	0%	16%
Legislate	22	4	17	0	7
Criticize	11	4	0	0	3
Explain to Constituency	22	52	17	13	33
As Member of Government	0	8	33	53	21
Party Activity	0	0	17	33	10

Promoting Constituency:

To take the people's problems and difficulties to the government and get the government to solve them. (A Local)

Legislate:

Keeping the pressure on the government for development and making sure that we go ahead. (An Intellectual)

Party Affairs:

To see that the Party is well organized, administered, and its committees are functioning well, and that people are participating. (A Politico)

Explaining Government Policy:

To tell the people government policy and make them understand. (A Local)

To get the people to obey the government and to let them know the government policy. (Silent Partner)

ministrators who were interviewed) have been grouped into three categories from weak to strong. Written responses by Tanzanian University students to the same questions are reported in conjunction with this discussion.²⁸

In an open competitive political system, controversial questions and policies may be subject to widespread debate and criticism. There is a public character to discussion, debate and political differences, and instances of corruption or internecine feuding regularly take place on a public stage in which the principal performers appeal for support for their views or findings. The extent to which politics is open and public is an important variable in Tanzanian politics. Norms which prescribe the boundaries within which the legislator may pursue his own or his constituents' interests are investigated by these three questions. The extent to which a legislator is expected to voice opposition publicly, to denounce instances of corruption, and to feel capable, in a controversy with TANU leaders, to carry the disagreement into broader national arenas are indicated by the legislators' responses.

The first question asked: "If the government

introduces a measure before the legislature which you are personally against and which you feel your constituents would not like, what would you do?"²⁹ Examples of the different types of response selected from interviews are:

Weak: He should go to see the Minister concerned and talk with him. Possibly he hasn't seen the measure correctly or perhaps people at home have concocted a story to give people fear. In this case he must explain it to them. (A Politico)

Moderate: I would oppose it, but if the majority are in favor of it I'll throw in my lot with them and then I will tell my constituency that I, with the rest of the Parliament, passed it, and give them reasons why we did so. (A Local)

Strong: Go to the relevant committee; try to stop it by convincing other M.P.'s. Then raise hell in the Parliament if I have to. Perhaps I would try to make an amendment. (An Intellectual)

²⁹ For legislators who were members of the government, and hence constrained in their M.P. role, these questions were phrased in the third person and their expectations about the behavior of a backbencher were solicited. Written versions, shown to administrators, were similarly in the third person.

²⁸ See Hopkins, *op. cit.*, pp. 376-384 for information about the questionnaire and sample.

TABLE 5. ROLE EXPECTATIONS OF LEGISLATIVE TYPES

	Intel- lectuals (N = 9)	Locals (N = 25)	Silent Partners (N = 6)	Politicos (N = 15)	All M.P.s (N = 58)	Adminis- trators (N = 50)	Total Elite (N = 108)	University Students (N = 112)
<i>Response to Government</i>								
<i>Bill Felt Wrong:</i>								
Weak	11%	8%	33%	20%	14%	12%	13%	6%
Moderate	22	72	67	60	57	38	46	5

Strong	22	20	0	0	17	34	25	67
	Leg/Adm $X^2=4.6$ Elite/Students $X^2=39.5^*$							

* These Chi-squares (X^2) are significant at the .05 level.

The second role question asked what an M.P. would do if he suspected corruption was occurring in some Ministry. Responses to this question tended to fall into categories of passivity or hesitancy to act (weak); reporting the suspicion privately to a Minister, the President or the Commission of Inquiry (moderate); or willingness to raise the issue openly in the Assembly (strong). There was a high degree of consensus on the "moderate" response.

Party membership is a requisite of membership in the Assembly. The third question asked: "If local TANU leaders disagreed with you and informed you they had expelled you from the Party, what would you do?" In fact, local Party officials do not, according to the TANU Constitution, have the authority to expel Party members. A bare majority of legislators (52%) gave moderate responses indicating that local officials did not have this power. Nearly a third felt that they would have to accept the Party's decision, perhaps even resign (indicating a weak response). A small group (17%) gave a strong response and indicated they would fight out their differences with local officials or would publicly appeal the decision to higher and broader arenas in the national Party.

The distribution of responses to these three questions suggests at least partial agreement among elites on these important role aspects. By calculating the variance of responses on these items, a rough indication of the degree of consensus among elite was obtained. The variances

of the three items were .458, .224, and .500, indicating greater consensus than a situation of role ambiguity in which there would be equal distribution of responses and a variance of .670.³⁰

The responses for these three questions among legislative types are contained in Table 5. Intellectuals, followed by Locals, consistently gave "stronger" responses than Silent Partners or Politicos. Legislators' and administrators' role expectations were distributed in a fairly similar fashion, while students were more aggressive in their definitions of the role. The students expected a stronger, more assertive role for M.P.'s than current members of the political elite. This difference in attitude may have also been reflected in the willingness of Tanzanian students to publicly protest National Service legislation which affected them. Six months after the responses were recorded, in October, 1966, 393 students (mostly from the University College) were expelled as a result of the protest demonstrations. These students were readmitted only after several steps had been taken to insure students would conform to the prevalent political norms.³¹

³⁰ See Hopkins, *op. cit.*, for the use of variance as a measure of consensus, pp. 393-94. This measure has been recommended by Neal Gross, *et al.*, p. 107.

³¹ See Raymond F. Hopkins and Neal Sherman, "Students and Politics in Tanzania," in Seymour M. Lipset and William J. Hanna (eds.), *Students and Politics in Africa* (forthcoming Basic Books).

TABLE 6. ROLE CONGRUENCE OF LEGISLATIVE TYPES

	Intel- lectuals (N=9)	Locals (N=25)	Silent Partners (N=6)	Politicos (N=15)	All M.P.s (N=58)	Adminis- trators (N=50)	Elite Total (N=108)
<i>Legislative:</i>							
High	22%	16%	33%	60%	29%	38%	33%
Medium	33	64	50	13	41	24	33
Low	44	20	17	27	29	38	33
Locals/Politicos $X^2=11.1^*$							
<i>Average: (Three roles)</i>							
High	22%	28%	33%	53%	33%	34%	33%
Medium	11	60	50	20	37	36	37
Low	67	12	17	27	30	30	30
Locals/Politicos $X^2=6.1^*$							

* These Chi-squares are significant at the $p < .05$ level. (See footnote 18).

The question on party expulsion revealed that legislators were not clear about the possible consequences. Some felt expulsion would not affect one's status as an M.P.; others correctly foresaw this as one method to remove a deviant M.P. from the Assembly. The confusion is illustrated in the response of a Politico:

A branch official can't expel him. Expulsion is only by the National Conference and he would still be an Mbunge, although he should resign due to the lack of confidence in him. But the National Conference can't expel him from the Parliament.

This is not quite accurate since the NEC has expelled members from the Party and this does result in loss to an M.P. of his seat. However, such responses indicate that some M.P.'s conceived of an independent status for *Wabunge*—an importance apart from that of the Party. The consequences of Party expulsion were not well understood, even by some important political leaders. This confusion serves to underline ambiguity in role expectations in a new state like Tanzania. The subsequent expulsion of nine members in October-December, 1968 has no doubt clarified these expectations considerably.

Role Congruence. Average standard scores have been used as a measure of the congruence (C) of each legislator's expectations on these three items. Legislators whose expectations are near the mean of expectations among all elite received high C scores.²² Table 6 shows the rela-

tive congruence among legislative types. It also presents their congruence on ten role expectation items, which include five items relating to Presidential role behavior and two items about administrators' behavior. *Intellectuals are the least congruent in their expectations; Politicos, the most congruent.* Locals are somewhat less congruent in their expectations than the average. Differences among the groups are significant. As mentioned earlier, of the nine Intellectuals interviewed, four—all with low congruence—have been removed from the National Assembly by means of expulsion from the Party.

The responses of those who are high on both legislative and average role congruence express expectations which, according to our analysis, are "normative." These expectations clearly tend to prevent the M.P. from acting in a divisive manner. The response of one Politico with a very high C score is illustrative.

If an M.P. dislikes a particular piece of legislation, he should first see the Minister and tell him; try to get it altered. The Minister may work through the Cabinet until all are prepared to accept some other version. Finally, and only if necessary, he should raise it in Parliament. If it is passed, however, he'll just have to support it or resign.

Such expectations tend to conform to the official expectations outlined earlier. This similarity

NI = the number of items

S_j = the standard deviation of the j th item, and

X_{ij} = 0, 1, or 2 according to a weak, moderate, or strong role expectation by the i th respondent.

²² This is accomplished by the formula

$$C_i = \sum_j^{NI} [2 - |(X_{ij} - \bar{X}_j)| / S_j] / NI$$

where

suggests that institutionalization of a pattern of closed politics is occurring, and that there is little conflict over rules of the game for legislators.³³

In fact, "congruent" expectations are not only close to "officially" stated expectations but also contain somewhat more restrained role boundaries for the public behavior of M.P.'s than those outlined by the President.³⁴

V. RULES FOR LEGISLATORS

Four rules or norms for legislative behavior, based on my analysis of the role expectations for legislators, can be stated which make clear some of the major characteristics of the Tanzanian "style" of politics. These rules, along with others governing the political action of government administrators, journalists, party bureaucrats and other political actors, tend to support the emergent elite political culture of "closed politics."³⁵

RULE 1: A legislator may express criticism or opposition to a government policy only on practical grounds, not on principle.

This rule stresses the maintenance of unity and ideological solidarity. It represents a point made by Nyerere in several of his speeches. It was affirmed by a number of the legislators during their interviews, most notably the Politicos.

RULE 2: An M.P. may not publicly oppose a policy decision decided in the Party's National Executive Committee (NEC).

This rule, though closely related to the first, is an important addition. Distinguishing between practical opposition and opposition which has an

³³ Samuel P. Huntington, *op. cit.*, Chapter One, discusses the importance of coherence for political institutionalization. Congruence between sets of expectations should be an important indicator of institutionalization. See Raymond F. Hopkins, "Political Roles and Political Institutionalization," an unpublished paper read at the American Political Science Association Meetings, September 2, 1969. Moreover, the variance indicative of consensus among role expectations for M.P.'s was markedly lower, 394, than among elite role expectations for the President (.519) or for administrators (.521).

³⁴ One M.P., an Intellectual, now expelled from the Party and the Assembly, claimed that Nyerere's expectations created opportunities for dissent. He stated: "You know, I like to make a lot of noise in the Assembly and I often disagree. President Nyerere is the only one who understands the need for this. If it weren't for him, they'd never let me get away with it."

³⁵ See Hopkins, *op. cit.*, for rules regarding the role of President and administrator.

ideological bent and is flatly contradictory to government policy is not an easy task. For example, in June, 1966, the question of nationalization was suggested by several Members. In a brief debate, at least one Member who argued against nationalization pointed out that it was the policy of the government to "encourage more the establishment of private industries."³⁶ However, in January, 1967, the NEC adopted the Arusha Declaration which called upon the government to further implement "the policy of socialism," by extending its control of the major means of production.³⁷ Two weeks later, when Parliament was asked to vote on five bills which would effect the recommended nationalization, these bills received the unanimous support of Members "who, one after another, took the floor to deliver militant speeches commending the Party, the government and the correct leadership of President Nyerere."³⁸ Rule 2, moreover, is not only visible in practice but several M.P.s explicitly articulated this obligation. "If the NEC has passed it, then the Members must support it," stated one Politico.

This second rule has an important effect upon the style of Tanzanian politics. Critics of government policy who want more rapid change and abandonment of present policies are enabled to announce publicly their views. For example, Michael Kamaliza, then Minister for Labor and Secretary-General of the government-regulated national trade union, NUTA, in addressing the fifth general council on December 27, 1966, made a strong plea for the government to move forward in the study of socialism and criticized high salaries in private industry and government's policy of encouraging private investment.³⁹ His speech was a full month before the Arusha Declaration which moved the country in this direction. Once policy has been decided in the NEC, however, and specific statements are endorsed, then criticism or opposition such as Kamaliza and others declared publicly, would be considered a violation of this rule. This tends to rule out almost all criticism by "conservative" spokesmen since prior NEC decisions tend to foreclose future options in this direction. When the closed, though by all accounts stormy, NEC meetings resolve an issue, this at once becomes a signal for the end of further controversy or discussion and the initiation of praise and rededication to the Party's policy decisions.

A corollary also follows from this rule,

³⁶ *Standard*, June 24, 1966.

³⁷ *Nationalist*, February 6, 1967.

³⁸ *Nationalist*, February 15, 1967.

³⁹ *Nationalist*, December 28, 1966. Kamaliza has since been dropped from his post.

namely, that the M.P.'s role as legislator is subordinate to his role as Party member. "TANU is supreme—even above the government," Second Vice-President Kawawa told Parliament.⁴⁰

One illustration of the Party's potency compared with that of the Assembly is through a specific comparison of the NEC with the *Bunge*. In a survey among the Dar es Salaam electorate, people were asked: "Which do you think has more influence in the way our government is run: the National Assembly or the National Executive Committee of TANU?" Thirty-four per cent said the *Bunge*, 40% the NEC, and 11% felt they were about equal.⁴¹ The same question, when asked of twenty-nine M.P.'s during their interviews, revealed that every member of the government (eleven) stated that the NEC was the more important organ. One Politico, a member of the NEC, replied to this question:

It's hard to say. Legally, I suppose, the National Assembly is, but in fact, I think the NEC. These fellows can discuss and air their views here and are free to speak inside the hall; but once they step outside these four walls, they will learn that there are others who have more power. If M.P.'s aren't careful, the Party can discipline them. And they'll have to recall their decisions since the Party has control over them.

Among those not in the government, sixty-seven per cent (12 of 18) felt the National Assembly was more powerful. Reluctance to acknowledge the paramountcy of the NEC was predominantly found among Locals.⁴²

RULE 3: An M.P. may oppose government policy in Party discussions or within the Assembly before the Assembly votes, but if the policy is passed, he must support it among his constituents.

⁴⁰ *Nationalist*, June 12, 1966.

⁴¹ This study is reported in Lionel Cliffe (ed.), *One Party Democracy* (Nairobi, 1967) in chapter 12 by Kenneth Prewitt and Goran Hyden.

⁴² A revealing incident occurred on one occasion when I raised this question subsequent to an interview (since the question was added part way through the interviewing process) in the presence of another Tanzanian. When the M.P. (a Local) declared that the *Bunge* was more powerful than the N.E.C., the other Tanzanian burst forth with, "No, no! That's the wrong answer." This other Tanzanian later took me aside and explained, "Some of these M.P.'s just don't understand the way things are." The deviance of Locals underscores the often unexpressed desire among Locals to increase the power and importance of the Assembly and, as a consequence, their own power and importance.

This rule emerged directly from the role expectation concerning opposition to a government policy. It closely resembles the classic formulation by Lenin of "democratic centralism." The rule encompasses the many bills whose details have been drawn up by the government, and not the NEC. Discussion of this sort of legislation, as well as numerous embarrassing questions, may be raised in the Assembly, and, following the election of September, 1965, criticism of this nature has increased.⁴³ But once the measure has passed, the M.P. must support it. He may not publicly voice his criticism to his constituents. The possible consequences for M.P.'s violating this formal dictum were outlined by Second Vice-President Kawawa in Parliament itself. He discussed legislation which would make it unlawful for a person to foment discontent or ill will for "unlawful purposes" and pointed out that such criticisms as those contrary to government plans would "be going against TANU and the Afro-Shirazi Party. . . . All members here are members of TANU and Afro-Shirazi Party, and there is a special procedure of dealing with any problem in a Party way."⁴⁴

Withholding one's own views, if they conflict with a decided policy, amounts to a type of secrecy. Thus, a necessary adjunct to Rules 2 and 3 is that information about political cleavages ought not to be discussed publicly. This secrecy is an important norm for not only legislators, but all elite.

A revealing instance of how this rule works is the case of Oscar Kambona, former Minister and Party Secretary-General. Although Kambona fled Tanzania in July, 1967, and apparently engaged in actions of a questionable nature, it was not until weeks later, when he publicly attacked other TANU and government officials, that President Nyerere and the Party press took open action against him. The sin by which Kambona finally apparently triggered official counter attacks was his public discussion of political cleavages.

Unfortunately there is an almost irrational quality to these prescriptions for a closed politics. Leaders are warned that it is sinful to reveal Party or state secrets; articles in the *Nat-*

⁴³ Debate and criticism in the Assembly meetings which occurred after the period covered by the content analysis, for at least the period of September-October 1966 until July, 1968, seem to have continued these trends. Policy initiative and criticism, judging by newspaper accounts only, appear to have increased somewhat in these sessions.

⁴⁴ *Nationalist*, June 29, 1966. The Afro-Shirazi Party is the only party on Zanzibar; it is not yet integrated with TANU.

nationalist stress the presence of Western spies eager to pry secrets from gullible leaders and civil servants and to foment divisions.⁴⁵ In contradiction to this, there are equally frequent statements by leaders that people should have nothing to fear, and that criticism is welcomed. As a consequence of these apparently contradictory norms, there amounts to what is, at least collectively, a schizophrenia about revealing information related to policy disputes. For example, committee meetings of the *Bunge* are held in camera. Some members interpret this to mean that they are forbidden to mention or discuss what occurs in these meetings. Others talk freely about committee activity, including the procedures, participation and substantive issues discussed. On a few occasions, members have even raised details of committee work in Assembly debates. This need for secrecy which arises from Rules 2 and 3 is a problem in Tanzania and a source of anxiety for at least some elite members because it is not clear what constitutes private Party or state matters.

RULE 4: An M.P. not a member of the government must consider constituency work his most important obligation.

Many members from constituencies take this dictum seriously. When Parliament is not in session, a typical M.P. spends two to three weeks each month traveling in his constituency. One M.P. estimated that he met or addressed 10,000 constituents each month. The M.P. often has a secretary, sometimes shared with another M.P. or the district Party office. Either the M.P. or his secretary is available each day to hear complaints or problems of constituents. The most frequent complaints were for better agricultural prices or involved misunderstandings between a citizen and government officialdom. The role of the M.P. in his constituency is an important extension of his general function as a legitimizer of the political system. As one legislator remarked, "People most often come to me because they think of me as their man in the government."

These four rules dictate that the M.P. who is not a member of government is above all else a communication link, a popularizer and legitimizer for the Party and the government. He is not a lawmaker. In a few rare instances, notably among Intellectuals, he may become a lobbyist.⁴⁶

⁴⁵ See, for example, statements of the Mwanza Area Commissioner, *Nationalist*, April 28, 1966, and frequent columns of "Pressman's Commentary" in the *Nationalist*.

⁴⁶ This term was actually used by one Intellectual describing his efforts to pressure the government on insurance regulation.

For instance, some M.P.'s articulate the interests of various groups such as workers and farmers. In an even more general sense, an M.P. may affect policy-making by his independent and uncoordinated criticism (as opposed to organized criticism). When such individual efforts multiply, as has occurred on a very few occasions, it has proven effective. For instance, numerous criticisms of affluence and arrogance were leveled toward Regional Commissioners and other Party leaders in mid-1966 Assembly sessions. These pressures were quite important in affecting changes such as the "voluntary" salary reduction of Ministers and higher civil servants, the withdrawal of government Mercedes-Benzes from personal use or assignment, and the stiff new rules limiting accumulation of wealth among leaders which were contained in the Arusha Declaration of 1967.

VI. CONCLUSION

This examination of the role of the M.P. reveals two things about Tanzanian politics. First, the role expectations among elites contain rules which support a pattern of closed politics. Major policy cleavages or serious leadership splits, such as the one between Nyerere and Kambona, are contained normally within the private arena of the Party structure, indeed, within the upper echelons of the Party structure. The continually stressed theme of unity both helps contain cleavages and is preserved by their containment. This fundamental principle of unity is stressed by all leaders, including Nyerere. This unity is supported by a set of rules channeling political cleavages into the Party structure to be absorbed and eventually resolved by the Party executive. These rules emerge from an analysis of aspects of the elite political culture. The role of the Assembly in this framework has been principally that of legitimization of government and Party decisions within the constitutional framework which gives Parliament supremacy over legislation.

The second conclusion which this study suggests is that in spite of "rules of the game" which foster closed politics, the National Assembly is not anachronistic or a mere showcase for propaganda purposes as may have occurred in Ghana under Nkrumah, for example.⁴⁷ M.P.'s play an important role as links between the government and the countryside, and their criticisms in the Assembly have affected some poli-

⁴⁷ Professor Henry L. Bretton in a private communication, February 22, 1969, suggested that in Ghana "Parliamentary proceedings were a form of shadow-boxing" and the institution was "impotent."

cies. The ability of the Tanzanian government to remain "responsive" depends in part on their activity.

Finally, one may ask, if M.P.'s were to exercise greater influence, comparable to the collective authority of the NEC, for instance, what effect might this have? By most criteria it would make Tanzania more democratic since it would increase the strength of the elected representatives of the people. However, it would also have, I believe, other effects which would probably be detrimental to democracy in the long run.

Frederick Frey has noted that "lawyers tend to be the largest single occupational group in parliament after parliament all over the world."⁴⁸ Yet, the Tanzanian parliament contains only two lawyers, one of whom is the Attorney-General, appointed by the President. The requisite level of legislative sophistication and skill is simply not generally found among Tanzanian M.P.'s in a degree sufficient to warrant their in-

creased participation in law-making. The expression of provincialism, idiosyncratic to legislators, is often in evidence in Tanzania, and is a singularly inappropriate goal. Increasing legislative power in Tanzania would, I believe, result in heightening regional and ethnic differences, encouraging pork-barrel bargaining and deals, and increasing the possibilities for corruption. Moreover, such a trend, although appearing to be a move toward promoting democratic practices, would eventually alienate intellectuals, technocrats and others, and spur the demise, not the growth, of representative procedures in the national governing system. Given the background and skills found in the National Assembly and the rules for role behavior embedded in the elite political culture, many M.P.'s perform an important function in the political system already as the people's surrogates, who meet in common with the governing elite and serve as a cathartic and legitimizing force in Tanzanian politics ameliorating the otherwise closed politics of the one Party system.

and deductive rigor of this approach, it is only now that political scientists can begin to see the incorporation of those considerations which less formal analyses identify as salient, and perhaps crucial, features of election contests.

One such consideration concerns the candidates' objectives. Specifically, spatial analysis often confuses the distinction between candidates who maximize votes and candidates who maximize plurality. Downs and Garvey, for example, assume explicitly that candidates maximize votes, though plurality maximization is clearly the assumption which Garvey actually employs, while Downs frequently assumes that vote maximization, plurality maximization, and the goal of winning are equivalent.² Downs, nevertheless, attempts to

Science (forthcoming); Gordon Tullock, *Toward a Mathematics of Politics*, (Ann Arbor: University of Michigan Press, 1968); David E. Chapman, "Models of the Working of a Two-Party Electoral System," *Papers on Non-Market Decision Making III*, (Fall 1967) and *Public Choice*, 5, (1969); Gerald Garvey, "The Theory of Party Equilibrium," *this Review*, LX, (1966).

²Downs, *ibid*, confuses vote maximization and plurality maximization in asserting that "each party seeks to receive more votes than any other," thus the "self-interest axiom [leads] to the vote maximizing government (p. 31)," and that all the actions of the party "are aimed at maximizing votes (p. 35)." Similarly, Garvey, *ibid*, states that "parties shift their platforms whenever such a shift will increase chances to gain a majority. Thus, each party constantly 'mobilizes' to represent the views of a larger portion of society (p. 30)." And while Tullock, *ibid*, initially identifies the comparative evaluation of a party's vote (which is implicit in the measure of plurality) as the party's objective by stating that "the party or candidate who receives the most votes will be given control" (p. 51), he apparently assumes throughout his analysis that this implies that candidates maximize votes. Perhaps the most careful investigation of the candidates' objectives is presented by William H. Riker, who offers what appears to be an additional possibility in *The Theory of Political Coalitions* (New Haven: Yale, 1962). Specifically, Riker argues that rational politicians do not maximize votes (or, conceiv-

disentangle these objectives, observing that plurality maximization is the appropriate objective for candidates in a single-member district, while vote maximization is appropriate in proportional representation systems with many parties. All subsequent spatial analysis research, however, assumes either implicitly or explicitly that candidates maximize plurality. If Downs is correct, therefore, this research may not be relevant for a general understanding of electoral competition in diverse constitutional or historical circumstances. The question then is whether those strategies that maximize votes differ from those strategies that maximize plurality.

To answer this question we extend the basic multidimensional model of the electoral process—a model which assumes that candidates maximize plurality.³ We formulate, within the structure of this model, the distinction between vote maximization and plurality maximization and we ascertain the strategic differences that the distinction logically implies. We review in Section 1 our assumptions and definitions, and we construct in Section 2 a rigorous distinction between the objective function of plurality-maximizing candidates and the objective function of vote-maximizing candidates. After identifying in Section 3 the optimal strategies for candidates who maximize votes, we conclude that although plurality maximizing candidates converge, vote maximizing candidates do not converge under some identical conditions. We also demonstrate that, for suitable conditions, if candidates maximize votes, the strategies the candidates prefer are sensitive to uniform variations in the cost of voting; if candidates maximize plurality, however, such variations in cost do not affect preferred strategies. We apply our analysis in Section 4 to some hypotheses which Downs proposes concerning the spatial strategies of candidates in multiparty systems. We conclude that the candidates which multiparty systems

ably, plurality), but that they seek minimal winning coalitions. Observe, however, that if two candidates compete the election is a zero sum game, in which case the maximization of plurality and the formation of minimal winning coalitions lead to identical results—the selection of minimax strategies. Riker's criterion yields the adoption of different strategies only if the position of one candidate is fixed, so that his opponent adjusts his position to suit his objectives with the opponent's strategy a fixed parameter of his calculus.

³ The model we seek to extend is presented in the references to Davis, Hinich, and Ordeshook, *op. cit.*

with proportional representation offer can provide distinct and stable strategies. But if a unimodal density describes the electorate's preference density, only three distinct strategies exist in equilibrium. Finally, we consider in Section 5 those strategies which candidates with mixed motives adopt, e.g., candidates who seek to maximize plurality while simultaneously maximizing a commodity such as financial contributions. We predicate this section of our analysis on two assumptions: (1) candidates require resources, such as finances, to alter their spatial location effectively; and (2) the calculus of voting which governs citizens' decisions is applicable to other forms of participation. We demonstrate with these assumptions that two competing candidates who maximize plurality might diverge from the mean of a symmetric, unimodal preference density. Because the proofs of our theorems are tedious and mathematically complex we relegate them to an appendix.

I. DEFINITIONS AND ASSUMPTIONS

The model we wish to generalize is a multidimensional extension of Downs's spatial framework. Hence, we assume that any number of "issues" may be necessary to characterize the citizens' preferences. To characterize the fundamentals of this model we require the following multidimensional notation:

$x = (x_1, x_2, \dots, x_n)$: the representation (referred to as a vector) of a citizen's preferences for all issues. Thus, x_i is the citizen's preferred position on issue i ;

$\theta = (\theta_1, \theta_2, \dots, \theta_n)$: the positions which candidate 1 advocates. The vector θ is called candidate 1's strategy;

$\psi = (\psi_1, \psi_2, \dots, \psi_n)$: the positions which candidate 2 advocates. The vector ψ is called candidate 2's strategy.

Several assumptions are either implicit in these definitions or required before the model is complete. Because we discuss these assumptions extensively elsewhere, we review them here only briefly.⁴

Assumption 1: Although an adequate description of the electorate's preferences requires several dimensions, a specific citizen may care about, and consequently estimate, a preferred position only for some of these dimensions. Thus, this citizen does not assign values to all elements of x . Similarly, it is possible that a citizen cannot specify a preferred position although the issue is salient. A citizen's awareness and concern for the issues

⁴ *Ibid.*

of Viet Nam and pollution, for example, do not guarantee his ability to identify preferred policies for such issues. We assume, nevertheless, that every citizen acts as if he estimates a preferred position on each issue (i.e., that every element of x has a numerical value).

Assumption 2: We assume that the vectors x , θ , and ψ are continuous variables. Obviously, many issues, as well as the electorate's preferences on them, can only be indexed discretely (e.g., religious preference, and partisan identification); many issues are dichotomous. The continuity assumption, nevertheless, is mathematically convenient because it facilitates the use of the continuous calculus.

Assumption 3: The candidates' strategies are not subscripted with an index for citizens: we assume that all citizens act as if they make identical estimates of θ . Thus, we interpret θ as the subjective estimate of candidate 1's strategy, ignoring the effects of perceptual distortion, imperfect information, and the possibility that no single measure can characterize a candidate's strategy. This assumption implies, moreover, that citizens estimate a position for each candidate on every dimension. Thus, we ignore the possibility that if a citizen does not care about an issue he does not bother to ascertain a candidate's policy on it.

Assumption 4: A density function, $f(x)$, characterizes the citizens' preferences, and points in the coordinate space of this density can represent the candidates' strategies. Obviously, the number of densities that might characterize preferences is infinite, but the most general results pertaining to candidates who maximize plurality follow from, among others, the assumption that $f(x)$ is symmetric.⁵ We assume, additionally, that $f(x)$ is not only symmetric, but unimodal. These assumptions, while not descriptive universally, permit tractable analysis of the strategies which vote-maximizing candidates should adopt, while allowing for conjecture about more general circumstances.

To conduct any analysis, however, we require assumptions about a citizen's evaluations of the candidates' strategies. We express this evaluation in terms of the utility loss which a citizen derives from each candidate's strategy if that candidate is elected. Symbolically, we denote the loss which the citizen associates with candidates 1 and 2 as $\phi(x-\theta)$ and $\phi(x-\psi)$ respectively.

Assumption 5: We assume that $\phi(x-\theta)$ and

⁵ By symmetry we mean that if the mean of $f(x)$ is normalized to zero, $f(x) = f(-x)$. This assumption is referred to as *radial symmetry*.

$\phi(x-\psi)$ satisfy two intuitively reasonable conditions: (1) they are zero if and only if the candidate's strategy and the citizen's preference are identical (i.e., $\phi(x-\theta) = 0$ if and only if $x = \theta$); (2) if the citizen's preference and the candidate's strategy do not coincide, the citizen derives some positive loss (i.e., $\phi(x-\theta) > 0$ if and only if $x \neq \theta$). A loss function which satisfies these conditions is the quadratic metric $\|x-\theta\|_A^2$, which in matrix notation equals,

$$(1) \quad \|x-\theta\|_A^2 = (x-\theta)'A(x-\theta)$$

This formulation implies marginally increasing loss as x and θ become more disparate. We assume, more generally, that a citizen can experience both marginally decreasing and marginally increasing loss. Thus, we allow citizens to become nearly indifferent between strategies that are far from their preferred positions. Symbolically, this is equivalent to assuming that

$$(2) \quad \phi(x-\theta) = \phi(\|x-\theta\|_A)$$

ϕ being a monotonic function of $\|x-\theta\|_A$. Since we discuss the properties of expressions (1) and (2) elsewhere, we note the simple example that if $n=2$, then the citizen's indifference contours are concentric ellipses about the point x and that the orientation of the major and the minor axes of these ellipses are all identical. We illustrate in Figure 1 the contours of a typical loss function for $n=2$.

Assumption 6: We assume that all citizens weight the issues in an identical fashion. This, perhaps the model's most bothersome assumption, requires, for example, that a citizen who prefers the mean of the electorate's density, attach the same relative importance to each issue as a citizen who prefers some extreme position. Thus, if $n=2$, then the rotation of the

FIGURE 1.

FIGURE 2.

major and the minor axes of the elliptical contours of each citizen's loss function are the same for all citizens. We portray in Figure 2 this assumption of common orientation (common matrix A) for three citizens.

These assumptions and definitions determine that if a citizen votes, he votes for the candidate who yields him the smallest loss. Not all citizens vote, however, and to the extent that the candidates' strategies affect turnout, we seek to express this relationship in our model.

Assumption 7: We assume that a citizen can abstain from voting, and that his probability of voting decreases as the loss he associates with his most preferred candidate increases. Referring to this characterization of a citizen's actions as *abstention from alienation*, we note that the condition of all citizens voting is a special case of this characterization.⁶

To formulate this assumption precisely let a citizen's preferred candidate be θ , and let R represent his reward from voting (expressed in terms of utility). If $R > 0$ the citizen votes and if $R \leq 0$ the citizen abstains. Denoting the deterministic components of this reward by $U(x, \theta)$, we assume that $U(x, \theta)$ diminishes as the loss associated with θ increases. Finally, we denote ϵ as a random variable which represents the components of R that are not

contained in $U(x, \theta)$.⁷ Summarily, we express R as

$$(3) \quad R = U(x, \theta) + \epsilon$$

Hence, if $U(x, \theta) + \epsilon$ is greater than zero, the citizen votes, and if $U(x, \theta) + \epsilon$ is less than or equal to zero the citizen abstains.

Note, however, that with the inclusion of ϵ in (3) the citizen neither votes nor abstains with certainty. Symbolically, we write the citizen's probability of voting as $\Pr[R > 0]$. To ascertain the relationship of $\Pr[R > 0]$ to θ , observe that the citizen's probability of voting is the probability that $U(x, \theta) + \epsilon > 0$; equivalently, this is the probability that $\epsilon > -U(x, \theta)$. Hence, $\Pr[R > 0] = \Pr[\epsilon > -U(x, \theta)]$, so that from our assumption that $U(x, \theta)$ decreases as $\phi(x - \theta)$ increases, $\Pr[R > 0]$ decreases as $\phi(x - \theta)$ increases.

We require one final assumption about voting and non-voting. Specifically, we wish to generate a function which expresses the probability that a citizen votes relative to any other citizen if we know each citizen's preferred position and the candidates' strategies.

Assumption 8: To simplify the exposition, consider citizens who prefer θ to ψ . We assume that any two citizens vote with equal probability if their preference vectors (x) are equidistant (as measured by the metric $\|x - \theta\|_A$) from the strategy θ . We assume, moreover, that citizen i votes with a greater probability than citizen j if and only if the

⁶ Clearly, alternative assumptions concerning the relationship of turnout to the candidates strategies are possible. For example, in Ordeshook, "Some Extensions . . .," *op. cit.*, abstention from indifference is analyzed. As yet, however, we have not incorporated this alternative assumption into our analysis of vote maximization.

⁷ Additionally, we assume that the expected value of ϵ is zero, and that it possesses a continuously differentiable density function defined in the interval $(-\infty, \infty)$. Also, we assume that ϵ is distributed independently of $U(x, \theta)$.

FIGURE 3.

distance between citizen i 's preference vector and θ is less than the distance between citizen j 's preference vector and θ .⁸

Assumption 8 allows us to define a function in the coordinate space of the electorate's preference density which completely characterizes relative probabilities of voting. We denote this function by $g(x-\theta)$ if θ is preferred to ψ , and $g(x-\psi)$ if ψ is preferred to θ .⁹ Thus, for any citizen, $\Pr[R > 0] = g(x-\theta)$ or $g(x-\psi)$. We can readily demonstrate two properties of the function g . First, g is symmetric about θ or ψ . This follows from the symmetry of citizens' loss functions. Second, g is monotonically decreasing as we move away from the relevant strategy vector, θ or ψ . This follows from the single peakedness of individual utility functions, and the assumption that $U(x, \theta)$ and $U(x, \psi)$ decrease as $\phi(x-\theta)$ and $\phi(x-\psi)$ increase. We illustrate in Figure 3 a representative form for $g(x-\theta)$ for a single dimension.

Note that the slope of g indicates the rate at which turnout decreases as we move away from the candidate's strategy. Somewhat imprecisely, we refer to this rate as the *sensitivity of turnout to variations in strategy*. We illustrate in Figure 4 a function for which the sensitivity is greater than the sensitivity cor-

responding to the function illustrated in Figure 3.

Since sensitivity is an important property of $g(x-\theta)$ we indicate some of its essential features. First, we note that the rate of change of $g(x-\theta)$ is not a dimensionless quantity—its value depends on the scales employed to index x . Thus, for a single dimension the magnitude of sensitivity has little meaning since the scales which index an issue are arbitrary. Second, if n is greater than one, sensitivity is a multi-dimensional concept. But the dimensions can be measured each by a different scale so that the magnitude of sensitivity with respect to one dimension cannot be compared meaningfully to the magnitude of sensitivity on some other dimension.

To facilitate our use of this notion we introduce a mathematical "trick" which renders measures of distance and of sensitivity comparable. This trick consists of transforming the axes of the issue space so that if $n=2$, for example, each citizen's indifference contours are concentric circles (instead of concentric ellipses).¹⁰ Thus, if we make $\phi(x-\theta)$ circularly symmetric, then $U(x, \theta)$, and $g(x-\theta)$ also

⁸ This assumption does not imply an interpersonal comparison of utility, but simply that if the preference vectors of two citizens are equidistant from their preferred candidate(s), then the benefits and costs of voting, as well as the density of ϵ , stand in the same relationship to each other for both citizens.

⁹ We assume, moreover, that $\lim_{\|x-\theta\| \rightarrow \infty} U(x, \theta)$

$+\epsilon < 0$. This insures that $g(x-\theta)$ is integrable. This assumption, however, places no substantive restrictions on our analysis.

¹⁰ Recall that a citizen's loss, $\phi(x-\theta)$, is a monotonic function of the metric $\|x-\theta\|_A$, where A is a positive definite $n \times n$ matrix. If this loss matrix is identical for all citizens (Assumption 6), there exists a linear transformation of the dimensions such that A becomes the identity matrix I . Thus, with no loss of generality we can assume that $\phi(x-\theta) = \phi(\|x-\theta\|)$, where x and θ are now measured in the transformed space. And since $\|x-\theta\|$ is constant on circles, $\phi(x-\theta)$ is constant on circles. Similarly, this transformation can also be designed so that, without any loss of generality, the axes of $f(x)$ correspond to the axes of our coordinate space.

become circularly symmetric. The rate of change of $g(x-\theta)$ with respect to x , then, is the same for all issues in the transformed space.

Observe, however, that the transformation of the axes which renders $g(x-\theta)$ circularly symmetric affects $f(x)$: this transformation leaves $f(x)$ *radically* symmetric and unimodal, but $f(x)$ is not necessarily *circularly* symmetric. (We illustrate in Figure 5 some contours for $g(x-\theta)$ and $f(x)$ as they might be before and after the axes are transformed.) That is, the variance of $f(x)$ may be different for each axis. This means that if we measure the rate of change of $g(x-\theta)$ for each axis in terms of the variance of $f(x)$ on that axis, then comparative differences in this rate can be observed. And it is differences in these rates which determine differences in the sensitivity of turnout to variations in strategy. Specifically, the intuitive idea behind sensitivity is that if it is high (low), the probability of voting decreases rapidly (slowly) as we move, say, one standard deviation (of $f(x)$ in the transformed space for a particular dimension) from θ . (Thus, sensitivity is higher in Figure 5 for issue 1 than it is for issue 2.)

Before considering the candidates' objective functions we note that an important special case of $g(x-\theta)$ occurs if the stochastic factor, ϵ , is not included in expression (3) (i.e., $R = U(x, \theta)$). R is not a random variable in this case, and a citizen either votes with certainty

FIGURE 4.

or abstains with certainty.¹¹ To ascertain whether or not a citizen votes, observe that $U(x, \theta)$ is greatest if $x = \theta$, in which case the citizen votes with certainty. As the disparity between x and θ increases, the citizen's loss increases, and $U(x, \theta)$ decreases. Disregarding those citizens who always vote, $U(x, \theta)$ eventually equals zero if this disparity becomes sufficiently great, say if the distance between x and θ is δ . Thus, if the distance between x and θ is less than δ the citizen votes with certainty; if the distance between x and θ

¹¹ An interpretation of this special case renders analysis with it less objectionable. Briefly, if the analysis is multidimensional, and if all dimensions of taste are assumed to be identified and measured then there may be little randomness in decision-making.

FIGURE 5.

FIGURE 6.

is greater than or equal to δ , then $U(x, \theta) \leq 0$, and the citizen abstains with certainty. Figure 6 illustrates a representative $g(x-\theta)$ for this special case. This function is a special case which facilitates the derivation of some results. Although we present these results in this essay, we assume the general form for deriving our central multidimensional conclusions.

II. THE CANDIDATES' OBJECTIVE FUNCTIONS

We can now define rigorously the candidates' objective functions (i.e., what they seek to maximize) in order to ascertain optimal strategies. To facilitate exposition we relegate the proofs of our results for the general multi-issue case to an appendix, and we restrict our mathematical discussion in the text to unidimensional competition ($n=1$).

The first step in formulating objective functions consists of identifying those citizens who prefer candidates 1 and 2 respectively. For the case of a single dimension, we assume without loss of generality that the candidates' strategies, θ and ψ , satisfy $\theta \leq \psi$. Since the citizens' loss functions are symmetric, and since by assumption, these functions are identical for all citizens (except for the value of the preferred position), all citizens whose most preferred positions fall to the left of the midpoint between the candidates' strategies, $(\theta+\psi)/2$, prefer the first candidate. Similarly, all citizens whose most preferred positions fall to the right of $(\theta+\psi)/2$ prefer candidate 2's strategy.

The second step consists of ascertaining the probability that a randomly selected citizen votes for, say, candidate 1. If $f(x)$ is the probability that a randomly selected citizen

prefers the position x , and that $g(x-\theta)$ is his probability of voting, then $f(x)g(x-\theta)$ is the probability that a randomly selected citizen prefers the position x , and votes for candidate 1. Hence, by "adding" all those values of $f(x)g(x-\theta)$ for all those citizens who prefer candidate 1 to candidate 2 (i.e., all citizens who prefer a position to the left of $(\theta+\psi)/2$), we represent the probability that a randomly selected citizen votes for the first candidate. We denote that probability $V(\theta, \psi)$, and we observe that for continuous variables $V(\theta, \psi)$ is expressed,

$$(4) \quad V(\theta, \psi) = \int_{-\infty}^{(\theta+\psi)/2} f(x)g(x-\theta)dx$$

Similarly, $V(\psi, \theta)$, the probability that a randomly selected citizen votes for candidate 2, is expressed,

$$(5) \quad V(\psi, \theta) = \int_{(\theta+\psi)/2}^{\infty} f(x)g(x-\psi)dx$$

Thus, if candidates maximize votes they seek to maximize the value of these functions.

If candidate 1, for example, maximizes plurality, his objective function, $P(\theta, \psi)$, becomes,

$$(6) \quad \begin{aligned} P(\theta, \psi) &= V(\theta, \psi) - V(\psi, \theta) \\ &= \int_{-\infty}^{(\theta+\psi)/2} f(x)g(x-\theta)dx \\ &\quad - \int_{(\theta+\psi)/2}^{\infty} f(x)g(x-\psi)dx \end{aligned}$$

Simply knowing a candidate's expected vote or expected plurality, however, does not reveal whether or not the candidate can find a better strategy. But for either objective function and for any pair of strategies, (θ, ψ) , we

can ascertain a candidate's incentive to shift towards an opponent's strategy, away from an opponent's strategy, or not move. Specifically, with equations (4) and (6), we can calculate for candidate 1 the rate at which $V(\theta, \psi)$ or $P(\theta, \psi)$ (depending on what he maximizes) changes as θ changes. By convention, we denote these rates as $\partial V(\theta, \psi)/\partial\theta$ and $\partial P(\theta, \psi)/\partial\theta$, respectively. The notation $\partial P(\theta, \psi)/\partial\theta$, for example, reads: "the rate of change of $P(\theta, \psi)$ as θ increases, for the strategy pair (θ, ψ) ." Thus if candidate 1 maximizes plurality and if $\partial P(\theta, \psi)/\partial\theta > 0$, the candidate increases his anticipated plurality by shifting to the right, towards ψ . Alternatively, if $\partial P(\theta, \psi)/\partial\theta < 0$, he increases his plurality by shifting away from ψ ; and if this rate of change equals zero, he doesn't move.¹² Hence, we have the following decision rules for candidates: If candidate 1 maximizes

$$\begin{array}{l} \text{votes, and if } \partial V(\theta, \psi)/\partial\theta \\ \text{plurality, and if } \partial P(\theta, \psi)/\partial\theta \end{array} \begin{cases} < 0, \text{ shift to the left} \\ > 0, \text{ shift to the right} \\ = 0, \text{ do not move} \end{cases}$$

Using equations (4) and (6), we find these rates of change by standard mathematical procedures.¹³ They are,

$$(7) \quad \partial V(\theta, \psi)/\partial\theta = \int_{-\infty}^{(\theta+\psi)/2} f'(x)g(x-\theta)dx - \frac{1}{2}f\left(\frac{\theta+\psi}{2}\right)g\left(\frac{\psi-\theta}{2}\right)$$

$$(8) \quad \partial P(\theta, \psi)/\partial\theta = \int_{-\infty}^{(\theta+\psi)/2} f'(x)g(x-\theta)dx$$

in which $f'(x)$ is the slope of the density of preferences evaluated at x ($f'(x)$ is written frequently as $df(x)/dx$). The first term on the right of the equality sign of equation (7) is a means for representing "the sum of the slopes of $f(x)$ for all values of x in the range $(-\infty, (\theta+\psi)/2)$, times the respective probability that

¹² This assumes that the candidate's plurality is not minimized if $\partial P(\theta, \psi)/\partial\theta = 0$. By inspection, however, we can generally eliminate such possibilities.

¹³ To differentiate $V(\theta, \psi)$ with respect to θ we apply Leibnitz's rule (see Francis P. Hildebrand, *Advanced Calculus for Applications* (Englewood Cliffs: Prentice Hall, 1963), p. 360, or any textbook of advanced calculus) and get,

$$\begin{aligned} \partial V(\theta, \psi)/\partial\theta &= \frac{1}{2}f\left(\frac{\theta+\psi}{2}\right)g\left(\frac{\psi-\theta}{2}\right) \\ &\quad - \int_{-\infty}^{(\theta+\psi)/2} f(x) \frac{\partial g(x-\theta)}{\partial\theta} \end{aligned}$$

Integrating this expression by parts yields equation (7).

citizens vote for candidate 1." This term is common to both equations (7) and (8). The term $\frac{1}{2}f((\theta+\psi)/2)g((\psi-\theta)/2)$, which is in (7) but not in (8), is $\frac{1}{2}f(x)$ evaluated at $x = (\theta+\psi)/2$, times $g(x-\theta)$ evaluated also for $x = (\theta+\psi)/2$. This term is always greater than or equal to zero; a subtraction in equation (7); and the only characteristic that distinguishes equation (7) from equation (8). Hence, this term is the first indication that the strategies which vote maximizing candidates and plurality maximizing candidates adopt may differ.

III. MAXIMIZING STRATEGIES

We demonstrate in this section that the preferred strategies of plurality maximizing candidates can differ from the preferred strategies of vote maximizing candidates. Briefly, we: (1) review the proof of a theorem which states that plurality maximizing candidates converge to the mean of a symmetric, unimodal density of preferences if citizens abstain because of alienation; (2) prove that, if both candidates maximize votes, an equilibrium exists in which the candidates might not converge; (3) ascertain the relationship between the location of the candidates' preferred strategies and the sensitivity of turnout to variations in strategy, and; (4) demonstrate that uniform variations in the cost of voting affect the location of the strategies which vote maximizing candidates prefer, but do not affect the location of strategies which plurality maximizing candidates prefer.

(A) *Equilibrium and Plurality Maximization:* To evaluate a candidate's strategy, we note from equations (7) and (8) that something must be known about the slope of the electorate's preference density. Consider symmetric unimodal densities and, without loss of generality, assume that the mean of $f(x)$ equals 0. Thus, $f'(x) \geq 0$ for all $x \leq 0$, and $f'(x) \leq 0$ for all $x \geq 0$. We can now demonstrate that the best strategy a *plurality maximizing* candidate can adopt is the mean, 0, if he knows that his opponent will adopt any strategy that might defeat him. Thus, we prove that the mean is a minmax strategy; if both candidates are at the mean they are said to be in equilibrium—neither candidate has any incentive to alter his position. Stated differently, a candidate receives a positive plurality if his strategy is the mean and if his opponent adopts any other strategy; the candidates tie if they both adopt the mean.

Sketching out the proof of this result for one dimension, we set candidate 2's strategy equal to the mean (i.e., $\psi = 0$). Since $g(x-\theta)$ is positive and $f'(x)$ is non-negative everywhere to the left of the mean—the range of integration of equation (8)— $\partial P(\theta, \psi)/\partial\theta > 0$ for all $\theta < \psi = 0$.

FIGURE 7.

Thus, candidate 1 increases his plurality by converging to his opponent. And, by symmetry, he obviously increases his plurality to zero so that the mean defeats all strategies that are less than zero. A parallel argument demonstrates that the mean defeats all strategies greater than zero. Elsewhere, we derive the following general multidimensional result:¹⁴

if both candidates maximize plurality, if citizens abstain because of alienation, and if $f(x)$ is a symmetric, unimodal, multivariate density, then a pure equilibrium strategy exists at the mean of $f(x)$, which is to say that the candidates converge to the mean

(B) *Equilibrium and Vote Maximization*: Turning now to the analysis of strategies if candidates maximize votes instead of plurality, we prove that such candidates might not converge. To see this we again set $\psi = 0$ and assume that $\theta \leq \psi$. Observe now that, although the first term on the right of equation (7) is positive for all $\theta \leq \psi = 0$ —we show this in the case of plurality maximization—the second term is a subtraction and might be greater than the first for θ less than ψ . If this occurs, $\partial V(\theta, \psi)/\partial \theta$ is not positive for all θ , and candidate 1 decreases his total vote by converging to his opponent.

To illustrate more formally that vote maximizing candidates do not converge, that the magnitude of the second term in (7) can exceed the magnitude of the first term, we assume that the abstention function $g(x-\theta)$ is the rectangular function which we illustrate in Figure 6. Second, we set candidate 2's strategy,

ψ , equal to 0 (with $\theta \leq \psi$). With these assumptions equation (7) reduces to¹⁵

$$(9) \quad \partial V(\theta, \psi)/\partial \theta = \frac{1}{2} f(\theta/2) - f(\theta - \delta), \text{ with } \psi = 0$$

Thus, if $f(\theta/2) > 2f(\theta - \delta)$, $\partial V(\theta, \psi)/\partial \theta > 0$, and the first candidate increases his vote by shifting towards candidate 2. But if $f(\theta/2) < 2f(\theta - \delta)$,

¹⁵ The rectangular abstention function equals 0 for all x in the intervals $(-\infty, \theta - \delta)$, and $(\theta + \delta, \infty)$ and equals 1 otherwise. Hence, equation (7) becomes,

$$\begin{aligned} \partial V(\theta, \psi)/\partial \theta &= \int_{\theta-\delta}^{(\theta+\psi)/2} f'(x) dx \\ &\quad - \frac{1}{2} f\left(\frac{\theta+\psi}{2}\right) g\left(\frac{\psi-\theta}{2}\right) \\ &= f\left(\frac{\theta+\psi}{2}\right) \left[1 - \frac{1}{2} g\left(\frac{\psi-\theta}{2}\right) \right] \\ &\quad - f(\theta - \delta) \end{aligned}$$

Observe now that whenever $g((\psi - \theta)/2) = 0$, $\partial V(\theta, \psi)/\partial \theta$ is positive. Hence candidate 1 should shift towards candidate 2 at least until $g((\psi - \theta)/2) = 1$. This occurs whenever the two abstention functions butt against each other or overlap. We can restrict ourselves then to strategies such that $g((\psi - \theta)/2) = 1$, in which case we get equation (9). Note, however, that if $f(x)$ is a uniform density, $f'(x) = 0$ in the relevant range of integration. This means that either the rate of change of $V(\theta, \psi)$ with respect to θ is zero or that it is negative. It is zero if the abstention functions do not butt, it is negative if they overlap. Thus, if $f(x)$ is a uniform density, the candidates do not converge so closely that the abstention functions of citizens preferring them overlap.

¹⁴ "Abstentions and Equilibrium . . ." *op. cit.*

FIGURE 8.

$\partial V(\theta, \psi)/\partial \theta < 0$, and candidate 1 should shift away from candidate 2. Finally, if

$$(10) \quad \frac{1}{2}f(\theta/2) = f(\theta - \delta)$$

the first candidate maximizes his total vote. We illustrate in Figure 7 a density, $f(x)$, and a threshold, δ , satisfying equation (10) with the appropriate optimal θ indicated. The pencil exercise of considering strategies to the left of this θ demonstrates that $\partial V(\theta, \psi)/\partial \theta > 0$, and that strategies to the right of θ yields $\partial V(\theta, \psi)/\partial \theta < 0$. Thus, a value of θ which is not equal to ψ maximizes candidate 1's vote, even though ψ is at the mean.

We are not interested, however, in demonstrating simply that one vote maximizing candidate does not converge necessarily to an opponent's strategy if that strategy is fixed at the mean. The question is whether or not two vote maximizing candidates, who can adopt any strategy, fail to converge and if an equilibrium exists. We prove in the appendix of this essay that:

if both candidates maximize votes, if citizens abstain because of alienation, and if $f(x)$ is the multivariate normal density, then an equilibrium exists; and if the sensitivity of turnout to variations in strategy is sufficiently low, the candidates do not converge

Several comments are in order concerning this result:

(1) Equilibrium strategies exist and the candidates fail to converge for a wider class of symmetric densities than the multivariate normal. The proof of our result does not assume the normal form, but its statement is simplified by avoiding complex mathematical conditions

and special cases. The theorem, nevertheless, demonstrates the dissimilarities in behavior between vote maximizing and plurality maximizing candidates.

(2) Although "if the sensitivity of turnout to variations in strategy is sufficiently low" is imprecise, we can formulate the condition rigorously. A rigorous formulation, however, is mathematically complex, so we relegate it to the appendix. Nevertheless, the spirit of our result is that vote maximizing candidates may or may not converge—depending on the sensitivity of turnout. We examine this relationship more carefully later in this section.

(3) If $f(x)$ is a univariate density ($n=1$), the candidates align themselves symmetrically on opposite sides of the mean (provided that the candidates do not converge). Hence, if the mean equals zero, and if θ^* and ψ^* are two equilibrium strategies, then $\theta^* = -\psi^* < 0$. We depict this situation in Figure 8 for a rectangular abstention function.¹⁶

¹⁶ Additionally, with the rectangular abstention function we can easily illustrate the proof that for $n=1$, only one strategy pair is an equilibrium pair. First, assume that $\theta \neq -\psi$, and that $\partial V(\psi, \theta)/\partial \psi = 0$. Thus,

$$\partial V(\psi, \theta)/\partial \psi = \int_{(\theta+\psi)/2}^{\psi+\delta} f'(x)dx + \frac{1}{2}f\left(\frac{\theta+\psi}{2}\right) = 0$$

or, equivalently,

$$\frac{1}{2}f\left(\frac{\theta+\psi}{2}\right) = f(\psi + \delta)$$

Now consider $\partial V(\theta, \psi)/\partial \theta$, which we know equals $\frac{1}{2}f((\theta+\psi)/2) - f(\theta - \delta)$. Thus, from the condition

FIGURE 9.

(4) If $f(x)$ is a bivariate density ($n=2$), the equilibrium strategies exist on the major or the minor axis of $f(x)$; the candidates align themselves on opposite sides of the mean. We must point out, however, that we establish only that local equilibria exist, and that the location of globally minmax strategies is not rigorously ascertained. Nevertheless, we conjecture that if the candidates fail to converge, they align themselves on opposite sides of the mean on the major axis of $f(x)$ (i.e., the axis of greatest variance). Hence, vote maximizing candidates might converge on one issue and diverge on another. We illustrate this possibility in Figure 9, in which θ^* and ψ^* are two equilibrium strategies, and the candidates converge on the second issue but diverge on the first issue.

(C) *Equilibrium and the Sensitivity of Turnout to Variations in Strategy*: Empirical relevance, however, requires that our result say more than that vote maximizing candidates might not converge. Specifically, if we seek to

that $\partial V(\psi, \theta)/\partial \psi = 0$, $\partial V(\theta, \psi)/\partial \theta = f(\psi + \delta) - f(\theta - \delta)$. But, $f(x)$ is symmetric about 0, and $\theta \neq -\psi$, so that $f(\theta - \delta) \neq f(\psi + \delta)$. Thus, $\partial V(\theta, \psi)/\partial \theta \neq 0$, which is to say that $\partial V(\theta, \psi)/\partial \theta$ and $\partial V(\psi, \theta)/\partial \psi$ cannot equal 0 simultaneously for $\theta \neq -\psi$. This proves, for rectangular abstention functions, that only a strategy pair satisfying $\theta = -\psi \leq 0$ is an equilibrium pair. To prove that only one such strategy pair satisfies this condition for a given δ and $f(x)$, we set $\psi = -\theta$ and get,

$$\partial V(\theta, \psi)/\partial \theta = \frac{1}{2}f(0) - f(\theta - \delta)$$

Obviously, this function equals zero for only one θ since $f(0)/2$ is a constant and $f(\theta - \delta)$ is monotonically increasing with θ for all $\theta \leq 0$.

predict how candidates act, we must know when they converge and when they do not converge. Hence, we must examine the relationship between the location of competitive electoral equilibria and the sensitivity of turnout to variations in strategy.

We begin by considering again univariate densities and rectangular abstention functions. If $f(x)$ is symmetric, if θ and ψ are in equilibrium, and if the mean of $f(x)$ equals zero, then $\theta = -\psi$. Thus if the candidates are in equilibrium, equation (7) becomes,

$$(11) \quad \partial V(\theta, \psi)/\partial \theta = \frac{1}{2}f(0) - f(\theta - \delta) = 0$$

We readily see from equation (11) that the condition of equilibrium depends on the properties of $f(x)$ and the parameter, δ , of the rectangular abstention function which we termed the sensitivity of turnout to variations in strategy (i.e., if δ is small sensitivity is high, and if δ is large sensitivity is low). We seek, therefore, to explore the nature of this dependence.

First, we define a distance x^* , measured from the mean of $f(x)$. Assuming that $f(x)$ is symmetric and that its mean equals 0, we select x^* so that $f(-x^*) = \frac{1}{2}f(0)$. Figure 10 illustrates this distance, x^* .

We select this distance because, if $\theta - \delta = -x^*$ and if $\psi + \delta = x^*$ (recalling that we are presently setting $\delta = -\psi$), equation (11) becomes,

$$\partial V(\theta, \psi)/\partial \theta = \frac{1}{2}f(0) - f(-x^*) = 0$$

But from the definition of x^* , $f(-x^*) = \frac{1}{2}f(0)$, so the candidates are in equilibrium if $\theta = \delta - x^*$ and $\psi = x^* + \delta$.¹⁷ Assuming that x^* is fixed, we

¹⁷ If θ is less than $\delta - x^*$, then $f(\theta - \delta) < f(-x^*)$

FIGURE 10.

can plot the strategy θ which maximizes candidate 1's vote against alternative values of δ —assuming that the candidates are in equilibrium—in Figure 11.¹⁸ (The use of line seg-

$=f(0)/2$, in which case $\partial V(\theta, \psi)/\partial \theta > 0$ from equation (11), and candidate 1 should shift towards the mean. Alternatively, if $\theta > \delta - x^*$, $\partial V(\theta, \psi)/\partial \theta < 0$, and candidate 1 should shift away from the mean.

¹⁸ Let $\delta > x^*$. Thus, since $f(x)$ is unimodal and $\theta \leq 0$, $f(-x^*) > f(\theta - \delta)$, in which case $\partial V(\theta, \psi)/\partial \theta > 0$ for all $\theta \leq 0$; the candidates converge to the mean. Now consider $\delta < x^*$. From equation (11), the condition for a maximizing value of θ is $f(0)/2 = f(\theta - \delta) = f(-x^*)$. If $2\delta \geq x^*$, an equilib-

rium is attained by selecting θ such that $-\theta = -x^* + \delta$ (this insures that $f(\theta - \delta) = f(x^*) = f(0)/2$). Clearly, then, as δ diminishes from x^* to $x^*/2$, θ diminishes from 0 to $-x^*/2$. Finally, if $2\delta < x^*$, equation (11) cannot be satisfied without violating the condition that the two candidates' abstention functions at least butt against each other.

Thus, an equilibrium is attained by setting $-\theta = \delta$ (observe that for $-\theta < \delta$, $\partial V(\theta, \psi)/\partial \theta > 0$, but for $-\theta > \delta$, this rate of change is negative). Thus, as δ diminishes from $x^*/2$ to 0, θ increases from $-x^*/2$ to 0.

FIGURE 11.

FIGURE 12.

Figures 3 and 4 the relationship of θ to δ is smooth.¹⁹)

Interpreting Figure 11, both candidates converge to the mean of $f(x)$ if $\delta=0$, or if $\delta \geq x^*$. If, however, $0 < \delta < x^*$, both candidates adopt strategies symmetrically about the mean, and the distance between each candidate increases and then decreases as δ increases. We can give this result quantitative significance by assuming that $f(x)$ is the normal density function, in which case $x^*=1.2\sigma$ (where σ is the standard deviation of $f(x)$). Thus, if citizens prefer policies greater than 1.2 standard deviations from their most preferred candidate's position vote, the candidates should converge to the mean.

It is unlikely, however, that such mathematical precision exists in reality or in our measurements of it. Nevertheless, we can infer two important conclusions from this result. First, vote maximization is neither a necessary nor a sufficient condition for non-convergence. If the variance of $f(x)$ is sufficiently small (i.e., if the sensitivity of turnout to variations in strategy is sufficiently high) both vote maximizing and plurality maximizing candidates converge. Thus, while the conclusion that candidates *do not converge* if they maximize their total vote is intuitively appealing, intuition fails to indicate that conditions exist for which such candidates converge. Consequently, intuition cannot suggest sufficient conditions for non-convergence. Our analysis specifies such con-

ditions, however, and these conditions can be formulated as an empirical hypothesis. Specifically, if turnout falls very rapidly or very slowly as the distance between a candidate's position and a citizen's preference increases (in which distance is measured in terms of the standard deviation of the density of preferences), the candidates should converge. But if turnout falls at some intermediate rate, the candidates should diverge. Thus, we hypothesize that the relationship between sensitivity and the amount of divergence is of the form of an inverted "U"—divergence increases and then decreases.

The interpretation of the relationship between sensitivity and the candidates' strategies can be extended if we consider some of the determinants of sensitivity. We can say, for example, that as the relative saliency of an issue increases the sensitivity of turnout to variations in strategy also increases. Thus, we can substitute the word saliency for the word sensitivity in our hypothesis. Let us consider in detail, however, a second factor—the cost of voting.

(D) *Equilibrium and the Cost of Voting:* Clearly, politicians can alter electoral outcomes by raising or lowering the cost of voting selectively through such devices as poll taxes, intimidation, and residency requirements. Consider, however, the implications of uniform variations in the cost of voting.²⁰ Specifically,

¹⁹ For example, a continuously differentiable abstention function can yield the relationship between δ and the equilibrium value of θ illustrated in Figure 12.

²⁰ The notion of a "uniform" variation in the cost of voting is defined rigorously in Hinich and Ordeshook, "Abstentions and Equilibrium. . .," *op. cit.* Briefly, if two citizens are the same distance from their preferred candidates, they vote

we wish to know if uniformly varying each citizen's cost of voting can affect electoral outcomes.

We approach this query by examining the relationship between this cost and the citizen's utility of voting. Clearly, if cost increases, the utility which a citizen derives from voting diminishes. Thus, $U(x, \theta)$ varies inversely with C , the cost of voting. This means that the disparity between x and θ necessary to set $U(x, \theta)$ equal to zero decreases as C increases. And it is this critical distance—which we denote by δ for the case of rectangular abstention functions—that determines the sensitivity of turnout to variations in strategy. Thus, sensitivity increases as C increases, *ceteris paribus*. Hence, one interpretation of our analysis is that, if the relative cost of voting is either high or low, the candidates should converge; but if C assumes intermediate values, the candidates should diverge.

Elsewhere, we demonstrate that for plurality maximizing candidates, if $f(x)$ is symmetric and unimodal, the mean of $f(x)$ is the dominant strategy for all levels of sensitivity.²¹ Thus, form our analysis of Figure 11,

if $f(x)$ is a symmetric, unimodal density, if citizens abstain because of alienation, and if the costs of voting are varied uniformly throughout the electorate, then equilibrium strategies are unaltered if the candidates maximize plurality, but such strategies are altered if the candidates maximize votes

Since a high or low sensitivity of turnout dictates convergence to the mean,

if $f(x)$ is a symmetric, unimodal density, if citizens abstain because of alienation, and if candidates maximize votes, then the cost of voting can be either uniformly raised or lowered so that the candidates converge to the mean

with equal probability; and a variation in the cost of voting is said to be uniform if they continue to vote with equal probability after such costs are altered (and if the abstention function g retains the mathematical properties we assume for it). For example, if g is the rectangular abstention function we can associate a δ with each person's function. We assume in our analysis that the same value for δ is associated with all citizens functions. Changing the cost of voting changes the magnitude of δ ; and a uniform variation in the cost of voting change δ equally for all citizens.

²¹ *Ibid.* We also demonstrate, however, that if $f(x)$ is not symmetric and if the candidates maximize votes, the location of a dominant strategy is sensitive to variations in sensitivity.

Thus, the equilibria of elections in which candidates maximize votes demonstrate a greater sensitivity to variations in the cost of voting than is found in plurality elections.

IV. MULTI-CANDIDATE CONTESTS

Thus far we have analyzed only two candidate competition. If candidates maximize plurality this is an admissible assumption, but if candidates maximize votes it is more appropriate to assume that many candidates compete. Hence, we relax our two-candidate assumption, and we consider multi-candidate contests.

Downs asserts that "parties in a multiparty system try to remain as ideologically distinct from each other as possible."²² Clearly, this is only one possibility, since the set of all distinct possibilities is,

- (a) all candidates seek to adopt distinct positions,
- (b) all candidates seek to converge to a common point,
- (c) some candidates wish to converge, but others do not wish to do so.

To examine each of these possibilities we must

²² *Op. cit.*, p. 115, 126–127. Tullock, *op. cit.*, p. 54–56, concludes for two issues, if all citizens vote, and if preferences are distributed uniformly over a rectangle or a circle, that three candidates do not converge. His illustration, however, assumes the consequence: Tullock's Figure XXXIX (p. 55) requires that candidates A and B have not adopted identical positions. If A and B are at the same point, however, then clearly candidate C should converge arbitrarily close to this point since this move maximizes both his plurality and his total vote. A careful scrutiny of this situation, nevertheless, yields some interesting observations. First, if all three candidates converge arbitrarily close to the mean, it is readily verified that such convergence is an equilibrium—no candidate has any incentive to shift unilaterally from the mean. Second, equilibria exist in which all three candidates adopt dissimilar positions symmetrically about the mean. In fact, there appear to be an infinity of equilibria triples—including convergence. This suggests that the final equilibrium triple is a function of initial conditions (e.g., the candidates' initial positions and whatever restrictions on strategies that exist) and their reaction paths. Clearly, then, multidimensional analysis of multiparty systems requires careful analysis, and this analysis undoubtedly will reveal many interesting and nonobvious conclusions. We are not prepared in this essay to conduct such an analysis, however, so we restrict our discussion to undimensional competition.

FIGURE 13.

consider the logic of Downs's analysis. Briefly, Downs asserts that parties do not converge in multi-party systems because they have little to gain by doing so. Parties which adopt positions near the extremes of the electorate's preference density do not converge toward the center because such movement succeeds in alienating voters who prefer these extreme positions. A party near the center has little incentive to converge to another party's position since such movement loses as many votes to one party as another party gains.

Implicit in this reasoning, however, are many assumptions concerning the rates at which the number of votes increases or decreases as strategies change. Specifically, we know from our analysis in the previous section that the strategic incentives of vote maximizing candidates depend upon the sensitivity of turnout to variations in strategy, or, equivalently, upon the cost of voting and the saliency of an issue. And conditions exist under which all candidates wish to converge to the center. To illustrate this possibility in dynamic terms, assume that three candidates initially adopt the positions α , θ , and ψ . (See Figure 13.) Observe now that if the sensitivity of turnout is sufficiently high or low, the second and third candidates, at θ and ψ , converge to the mean, while the first candidate, at α , seeks to converge to θ .²³ Thus,

²³ Throughout this section we also assume that if a citizen votes, he votes for his most preferred candidate. Thomas W. Casstevens attempts to show that this assumption follows logically from the voter's decision theoretic calculus in "A Theorem About Voting," this REVIEW, LXII (March, 1968). But Casstevens assumes that if a voter switches from candidate 1 to candidate 2, he does not affect the probability that candidate 3 wins—an assumption which does not follow logically from his structure (see Gerald H. Kramer, letter to the editor, this REVIEW, LXII (September, 1968)). Note however, that we are

all three candidates eventually converge to the mean. Vote maximization, then, is not a sufficient condition for distinct strategies.

Our illustration also reveals a potential instability in competition. New parties might form at the extremes of the distribution of preferences after the original three parties converge since no party represents these extremes. With the absence of constraints on strategies, these new parties also seek to converge to the mean, leaving the extremes unrepresented again and the cycle resumes. This is the dilemma of parties in multi-party systems: vote maximization can require converging to the mean, while such convergence leaves the party vulnerable to the formation of new parties on its flank. Clearly, this problem confronts parties in electoral systems employing the plurality formula. The ease of entry and the rewards of new parties, however, are typically greater in systems in which candidates maximize votes than in systems in which they maximize plurality.²⁴ Thus, if a party maximizes votes, its leadership is more likely to be concerned with balancing its quest for votes and the threat of new parties than is the leadership of parties in plurality systems.

This system, of course, is an idealized construct in which parties and candidates have perfect spatial mobility. Typically, such factors as ideological patterns of recruitment, the historical association of parties with specific platforms, and the preferences of candidates themselves constrain the parties and their candidates. Nevertheless, we can discern some factors for stability in the model by considering intermediate levels of the sensitivity of turnout to variations in strategy.

We observe, previously, that two vote-maximizing candidates do not converge for such intermediate levels of sensitivity. We conjecture, therefore, that equilibrium is possible under similar conditions if the number of competing candidates exceeds two. To see this, assume that three candidates compete and that

assuming that the candidates maximize votes, in which case the behavioral proposition that citizens vote for a preferred candidate to increase a candidate's total vote is admissible. For a decision-theoretic analysis of a citizen's calculus in multiparty systems see Richard McKelvey and Peter C. Ordeshook, "A General Theory of the Calculus of Voting," (unpublished, University of Rochester, 1970.)

²⁴ William H. Riker, Peter C. Ordeshook, and Kul B. Rai, "A Theory of the Number of Political Parties" (unpublished, University of Rochester, 1970).

FIGURE 14.

their strategies are α , θ , and ψ . Assume, further that the candidates cannot cross each other (i.e., $\alpha \leq \theta \leq \psi$).²⁵ Finally, assume that the abstention function, $g(x - \theta)$, is rectangular (see Figure 6). With these assumptions, the necessary condition for an equilibrium in which the candidates do not converge is the system of simultaneous equations,

$$\partial V(\theta, \psi, \alpha) / \partial \theta = f\left(\frac{\theta + \psi}{2}\right) - f\left(\frac{\theta + \alpha}{2}\right) = 0$$

$$\partial V(\psi, \theta, \alpha) / \partial \psi = f(\psi + \delta) - \frac{1}{2}f\left(\frac{\theta + \psi}{2}\right) = 0$$

$$\partial V(\alpha, \psi, \theta) / \partial \alpha = \frac{1}{2}f\left(\frac{\theta + \alpha}{2}\right) - f(\alpha - \delta) = 0$$

or equivalently,

$$(12) \quad f\left(\frac{\theta + \alpha}{2}\right) = f\left(\frac{\theta + \psi}{2}\right) = 2f(\psi + \delta) \\ = 2f(\alpha - \delta)$$

We illustrate a case which satisfies equation (12) in Figure 14. Note that the candidates do not converge, and that they array themselves about the mean of the symmetric density $f(x)$. Additionally, observe that the non-symmetric density $f_0(x)$ also satisfies equation (12) for the same three strategies. This later observation suggests that *similar electoral outcomes may result from dissimilar densities of preference if more than two candidates compete and if the candidates maximize votes.*

This analysis produces one additional result if we consider the effect of a fourth party's formation to the right of ψ . Denoting this new party's strategy by β , the conditions for an equilibrium in which the candidates do not converge are,

²⁵ The restriction that candidates cannot cross each other is suggested by Downs, *op. cit.*, p. 123.

$$(13) \quad f\left(\frac{\theta + \psi}{2}\right) = f\left(\frac{\theta + \alpha}{2}\right) = f\left(\frac{\psi + \beta}{2}\right) \\ = 2f(\psi + \delta) = 2f(\alpha - \delta)$$

Observe, however, that the first three terms of this equality cannot be satisfied simultaneously for unimodal densities (unless $f(x)$ is a uniform density). This result implies that the two centrally located candidates (at θ and ψ) converge.²⁶ Stated differently, *if $f(x)$ is unimodal, and if the candidates maximize votes, only three distinct positions are represented in the election.* This result also describes the strategic implication of new parties that form at the extremes of the electorate's preferences. Specifically, *if $f(x)$ is unimodal, and if candidates maximize votes, the formation of new parties at the extremes of the electorate's preference forces the central (and presumably major) parties to vie with each other at the mean.*

Of course, $f(x)$ need not be a unimodal density, in which case many parties presumably can exist in equilibrium without converging. In lieu of pursuing such innumerable possibilities, we summarize our unidimensional analysis of

²⁶ To see this assume that α and θ are fixed and let β form to the right of ψ . The rate of change in votes for ψ becomes,

$$\frac{\partial V(\psi, \alpha, \theta, \beta)}{\partial \psi} = \frac{1}{2}f\left(\frac{\psi + \beta}{2}\right) - \frac{1}{2}f\left(\frac{\theta + \psi}{2}\right)$$

Clearly, since $f(x)$ is unimodal and θ is fixed at the mean with $\beta > \psi > \theta$,

$$f\left(\frac{\psi + \beta}{2}\right) < f\left(\frac{\theta + \psi}{2}\right).$$

Thus, ψ converges to θ . It is readily shown that θ has no incentive now to shift to the left, so that with β assuming the old position of ψ the candidates are in equilibrium.

multi-party systems by reformulating Downs's assertion,

if $f(x)$ is a symmetric, unimodal density, if the candidates maximize votes, and if alienation causes abstention, then all candidates converge to the mean if the sensitivity of turnout to variations in strategy is either high or low; but if this sensitivity assumes some intermediate value, three distinct strategies exist in equilibrium

V. MIXED MOTIVES

Candidates, however, do not simply adopt a dominant position, or shift about on the issues during a campaign. Candidates bargain, cajole, and compromise as they progress through the maze of individual and conflicting demands present in a plural society. Similarly, voting is only one form of possible citizen participation. Citizens can contribute finances, ring doorbells, provide endorsements, or frequently, nominate a candidate. Thus, candidates must weight some citizens' preferences more heavily than others when formulating campaign strategy. Consequently, the strategies candidates do adopt should reflect the unequal importance of citizens. We seek, therefore, to render spatial analysis compatible with these observations.

As we note elsewhere, however, a single mathematically precise theorem cannot summarize all of the forces which affect a candidate's decision.²⁷ Instead, we must apply several theorems in concert to the explanation of complex situations. We do not propose, then, to deduce new theorems in this section, but to illustrate the implications of our analysis for the problem of candidates who maximize plurality and who seek resources such as finances to conduct their campaigns.

Considering a simple example, we assume that: (1) the electorate consists of two groups which are differentiated by the resources that their members are able to contribute to a campaign. (2) Members of the first group either vote or abstain from voting. (3) Each member of the second group, in addition to voting, can contribute a commodity, say A , to his most preferred candidate's campaign. (4) A member of the second group contributes A if his expected utility from voting is sufficiently great. (5) Each candidate values the commodity A , and each candidate seeks to maximize his supply of it. (6) The candidates seek to maximize their plurality of votes. (7) The preferences of both groups are distributed symmetrically and unimodally and with identical means.

²⁷ Davis, Hinich, and Ordeshook, *op. cit.*

Ceteris paribus, the candidates should converge to the mean preference of the first group; but, since the candidates maximize A , they may seek to diverge from the mean preference of the second group. Clearly, the candidates' campaigns are simplified if the strategies that they adopt with respect to each group are independent: each group may be concerned with a different subset of issues, or each group might be unaware of the policies which a candidate advocates to the other group. Frequently, however, the concerns of such groups overlap and information cannot readily be controlled. The strategic imperatives of the two groups conflict.

One approach to this conflict is to adopt some simplified decision rule such as selecting a strategy which compromises the optimal strategies of the two groups. The question is, however: What weight should a candidate assign to the demands of each group? Should a candidate adopt a position near the mean of the first group or near the optimal strategy of the second group? To answer such questions candidates must ascertain the relative value of A , which is to say that we must ascertain the rate at which A can be converted into votes. For example, a candidate may be willing to forego a secure spatial position on an issue in order to secure sufficient finances so that he can support a campaign to vary his spatial location on some other issue, or so that he can vary the relative saliency of an issue.

Unfortunately, virtually no systematic knowledge exists concerning either the production possibilities of campaign resources or how candidates calculate these possibilities. Nevertheless, in lieu of such knowledge we propose an hypothesis: The greater the degree of competition the more value a candidate assigns to such resources as finances, endorsements, and the support of activists. The logic of this hypothesis is that as competition increases, a candidate needs more resources to implement an effective campaign. A candidate, for example, might attempt to convince the electorate that his opponent supports some unpopular policy. The greater the threat which such attempts pose, the more resources a candidate requires to counteract it. Thus, in terms of our illustration, the greater the degree of competition the greater the weight a candidate assigns to the strategic imperatives of the second group. Consequently, as competition increases, the distance each candidate's strategy diverges from the mean increases.

This conclusion clearly contradicts the assertion that competition fosters middle-of-the-road candidates. It provides one explanation

for Warren E. Miller's observation that "party differences *within* [a congressional] district are heightened when electoral competition is keen and are reduced under single party domination of congressional electoral politics," and that "evenly balanced two-party competition . . . is associated with the reduction if not the total absence of direct representation of constituency policy preferences."²⁸ Briefly, two candidates may not converge if the citizens' preferences are distributed unimodally—the candidates may be maximizing valuable resources and this maximization can warrant strategies that diverge from the mean preference.

APPENDIX

The proof of our theorem consists, first, of demonstrating by a suitable selection of the dispersion of $f(x)$, that an equilibrium exists for $n=1$ in which the candidates do not converge. This technique is then applied to the more general multidimensional situation. Without loss of generality we assume that the mean of $f(x)$ equals zero, and that $\theta \leq \psi$. The expressions for $\partial V(\theta, \psi)/\partial \theta$ and $\partial V(\psi, \theta)/\partial \psi$ become,

$$(A1) \quad \frac{\partial V(\theta, \psi)}{\partial \theta} = \int_{-\infty}^{(\theta+\psi)/2} f'(x)g(x-\theta)dx - \frac{1}{2}f\left(\frac{\theta+\psi}{2}\right)g\left(\frac{\psi-\theta}{2}\right)$$

$$(A2) \quad \frac{\partial V(\psi, \theta)}{\partial \psi} = \int_{(\theta+\psi)/2}^{\infty} f'(x)g(x-\psi)dx + \frac{1}{2}f\left(\frac{\theta+\psi}{2}\right)g\left(\frac{\theta-\psi}{2}\right)$$

where (A1) is candidate 1's rate of change of vote, and (A2) is candidate 2's rate of change of vote. Setting $\theta = -\psi$, equations (A1) and (A2) reduce to,

$$(A3) \quad \frac{\partial V(\theta, \psi)}{\partial \theta} = \int_{-\infty}^0 f'(x)g(x-\theta)dx - \frac{1}{2}f(0)g(\psi)$$

$$(A4) \quad \frac{\partial V(\psi, \theta)}{\partial \psi} = \int_0^{\infty} f'(x)g(x-\psi)dx + \frac{1}{2}f(0)g(\theta)$$

but, since g is symmetric, $g(\psi) = g(\theta)$ so that,

$$(A5) \quad \frac{\partial V(\theta, \psi)}{\partial \theta} = -\frac{\partial V(\psi, \theta)}{\partial \psi}, \quad \theta = -\psi$$

If $\partial V(\psi, \theta)/\partial \psi = 0$ for $\psi = -\theta \neq 0$, then, from equation (A5), $\partial V(\theta, \psi)/\partial \theta = 0$, and the candi-

dates are in an equilibrium in which $\psi = -\theta \neq 0$ (i.e., they do not converge to the mean).

The proof that such an equilibrium can exist consists now of demonstrating that this occurs with a suitable choice of the variance of $f(x)$. Assume that $g(x-\theta)$ goes to zero for some finite x , say x' , so that $g(x-\theta) = 0$, $|x-\theta| > x'$. Now by increasing the variance of $f(x)$ in the range $(x', 0)$, $f'(x)$ can be set as close to zero as we wish in this range. Thus, the integral term in equation (A3) can be made as small as we wish without affecting $\frac{1}{2}f(0)g(\psi)$. With a suitable selection of $f'(x)$, therefore, we set,

$$\int_{-\infty}^0 f'(x)g(x-\theta)dx = \frac{1}{2}f(0)g(\psi)$$

so that the candidates do not converge and are in equilibrium.

We now generalize our result for multivariate $f(x)$, i.e., x is a vector. We assume that a citizen's loss, $\phi(x-\theta)$, is a monotonic function of,

$$\|x-\theta\|_A^2 = (x-\theta)'A(x-\theta)$$

where A is a positive definite $n \times n$ matrix. If this loss matrix is identical for all citizens, there exists a linear transformation of the dimensions such that A is the identity matrix I in the transformed space. Thus, with no loss of generality we assume,

$$(A6) \quad \phi(x-\theta) = \phi\left(\sum_{i=1}^n (x_i - \theta_i)^2\right)$$

Assume that $f(x)$ possesses major and minor axes such that these axes are represented as straight lines (among the numerous densities possessing this property, for example, is the multivariate normal density function). Suppose, now, that the domain of competition between θ and ψ is restricted to the line,

$$(A7) \quad \theta = c\psi$$

which passes through the origin and is a major or minor axis of $f(x)$. By a rotation of the axis it is possible to transform this line onto one of the coordinate axes, say x_1 . Both candidates, therefore, choose the median preferred position of the population on issues 2 through n (which are normalized to zero for convenience). Let $f_0(x)$ and $g_0(x-\theta)$ be $f(x)$ and $g(x-\theta)$ in the rotated coordinate system, and let x and θ now be measured in this new system. Obviously $f_0(x)$ is symmetric if $f(x)$ is symmetric. Additionally, since the loss matrix is the identity, the rotation of the axis leaves the loss function ϕ invariant, i.e., also in the new coordinate system equation (A6) remains valid. Thus, since $g(x-\theta)$ is a function of ϕ , $g_0(x-\theta)$ depends only on $\sum_{i=1}^n (x_i - \theta_i)^2 = \|x-\theta\|^2$, and is sym-

²⁸ "Majority Rule and the Representative System of Government," in *Cleavages, Ideologies and Party Systems: Contributions to Comparative Political Sociology*, ed. by E. Allardt and Y. Litunen (Helsinki: Transactions of the Westermarck Society, 1964), p. 359, 376.

metric. Simplifying notation, we drop the subscript "o".

The vote for candidate 1 is expressed in vector notation now as,

$$(A8) \quad V(\theta, \psi) = \int_R f(x)g(x - \theta)dx$$

where,

$$(A9) \quad R = \{x: \|x - \theta\| < \|x - \psi\|\} \subset E^n$$

i.e., R is a set in n -dimensional Euclidean space containing the most preferred positions of all citizens who prefer θ to ψ . To facilitate presentation we restrict our analysis now to the case of $n=2$. The method of analysis, however, is easily generalized. Thus,

$$x = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix}, \quad \theta = \begin{bmatrix} \theta_1 \\ \theta_2 \end{bmatrix}, \quad \text{and} \quad \psi = \begin{bmatrix} \psi_1 \\ \psi_2 \end{bmatrix}$$

Let $y = x - \theta$ and $\xi = \theta - \psi$.

Observe now that $\|x - \theta\| = \|y\|$, and $\|x - \psi\| = \|y + \xi\|$. Thus, $R = \{y: \|y\| < \|y + \xi\|\}$, so that from (A8) and (A9) we get,

$$(A10) \quad V(\theta, \psi) = \int_R f(y + \theta)g(y)dy$$

Reexpressing R ,

$$\begin{aligned} R &= \{y: \|y\| < \|y + \xi\|\} \\ &= \{y: y_1^2 + y_2^2 < (y_1 - \xi_1)^2 + (y_2 + \xi_2)^2\} \\ &= \{y: 0 < 2\xi_1 y_1 + 2\xi_2 y_2 + \xi_1^2 + \xi_2^2\} \\ &= \{y: 2\xi_1 y_1 > -2\xi_2 y_2 - \xi_1^2 - \xi_2^2\} \end{aligned}$$

And, defining,

$$y^* = -\frac{2\xi_2 y_2 + \xi_1^2 + \xi_2^2}{2\xi_1}$$

we get for R ,

$$R = \{y: y_1 > y^*\}$$

Suppose now, without loss of generality, that $\theta_1 < \psi_1$. Thus, from the definition of ξ ,

$\xi_1 = \theta_1 - \psi_1 < 0$, so that (A10) can be taken out of vector notation and rewritten as,

$$(A11) \quad V(\theta, \psi) = \int_{-\infty}^{\infty} \int_{-\infty}^{y_1^*} f(y_1 + \theta_1, y_2 + \theta_2) \cdot g(y_1, y_2) dy_1 dy_2$$

Our next step is to differentiate $V(\theta, \psi)$ with respect to θ_1 . We observe first that,

$$\frac{\partial y_1^*}{\partial \theta_1} = \frac{2\xi_2 y_2 + \xi_2^2}{2\xi_1^2} - \frac{1}{2}$$

Thus, using Leibnitz's rule (see footnote 12), we get,

$$\begin{aligned} (A12) \quad \partial V(\theta, \psi) / \partial \theta_1 &= \int_R \frac{\partial f(y + \theta)}{\partial x_1} g(y) dy \\ &+ \int_{-\infty}^{\infty} f(y_1^* + \theta_1, y_2 + \theta_2) g(y_1^*, y_2) \\ &\cdot \left[\frac{2\xi_2 y_2 + \xi_2^2}{2\xi_1^2} - \frac{1}{2} \right] dy_2 \end{aligned}$$

To show that an equilibrium can exist such that the candidates do not converge and that they adopt strategies symmetrically on opposite sides of the mean on either the major or the minor axis of $f(x)$, let $\psi_1 = -\theta_1$ and $\psi_2 = \theta_2 = 0$. Thus, $\xi_1 = 2\theta_1$, $\xi_2 = 0$, and $y_1^* = \theta_1$. Substituting these identities, and $x = y + \theta$ into expression (A12), we have,

$$\begin{aligned} (A13) \quad \partial V(\theta, \psi) / \partial \theta_1 &= \int_{-\infty}^{\infty} \int_{-\infty}^{\theta_1} \frac{\partial f(x_1, x_2)}{\partial x_1} g(x_1 - \theta_1, x_2) dx_1 dx_2 \\ &- \frac{1}{2} \int_{-\infty}^{\infty} f(0, x_2) g(-\theta_1, x_2) dx_2 \end{aligned}$$

Thus, by increasing the variance of $f(x)$ we can make the first term of (A13) as small as possible without affecting the magnitude of the second term. This proves that an equilibrium exists such that the candidates do not converge towards each other along either axis of $f(x)$. We now show that an equilibrium on an axis of

FIGURE 15.

$f(x)$ is at least a local equilibrium, i.e., that $\partial V(\theta, \psi)/\partial\theta_2 = 0$. First, we observe that,

$$\partial y_1^*/\partial\theta_2 = -\frac{y_2 + \xi_2}{\xi_1}$$

Thus, again applying Leibnitz's rule, we get from (A11),

$$\begin{aligned} \partial V(\theta, \psi)/\partial\theta_2 &= \int_R \frac{\partial f(y + \theta)}{\partial x_2} g(y) dy \\ &- \frac{1}{\xi_1} \int_{-\infty}^{\infty} f(y_1^* + \theta_1, y_2 + \theta_2) g(y_1^*, y_2) (y_2 + \xi_2) dy_2 \end{aligned}$$

Setting $\psi_1 = -\theta_1$, $\psi_2 = \theta_2$, our presumed local equilibrium state, and $x = y + \theta$, we have,

$$\begin{aligned} \partial V(\theta, \psi)/\partial\theta_2 &= \int_{-\infty}^{\infty} \int_{-\infty}^0 \frac{\partial f(x_1, x_2)}{\partial x_2} \\ &\cdot g(x_1 - \theta_1, x_2 - \theta_2) dx_1 dx_2 \\ &- \frac{1}{2\theta_1} \int_{-\infty}^{\infty} [x_2 - \theta_2] f(0, x_2) \\ &\cdot g(-\theta_1, x_2 - \theta_2) dx_2 \end{aligned}$$

Finally, if $\theta_2 = 0$ (i.e., if the axis of $f(x)$ is rotated to correspond to an axis of the coordinate space), we get,

$$\int_{-\infty}^{\infty} x_2 f(0, x_2) g(-\theta_1, x_2) dx = 0$$

This follows from the symmetry of $f(0, x_2)g(-\theta_1, x_2)$ in x_2 . And, since $\partial f(x_1, x_2)/\partial x_2$ is an odd function of x_2 ,

$$\int_{-\infty}^{\infty} \frac{\partial f(x_1, x_2)}{\partial x_2} g(x_1 - \theta_1, x_2) dx_2 = 0.$$

so $\partial V(\theta, \psi)/\partial\theta_2 = 0$.

We illustrate in Figure 15 some contours of a symmetric density which is rotated so that the major and minor axes of $f(x)$ correspond to x_1 and x_2 . The vector A in this illustration corresponds to $\partial V(\theta, \psi)/\partial\theta_2$; and B corresponds to $\partial V(\theta, \psi)/\partial\theta_1$. The vector C corresponds to the rate of change of candidate 1's vote as θ changes in the direction of C , and the magnitude of C can be expressed as

$$C = \frac{\partial V(\theta, \psi)}{\partial\theta_1} \cos \gamma + \frac{\partial V(\theta, \psi)}{\partial\theta_2} \sin \gamma$$

where γ is the angle between C and B . But we have just shown that both terms of this expression equal zero, so the magnitude of C equals zero. Thus, the candidate's total vote declines if he shifts in any direction from θ , and θ is at least a local equilibrium point.

CROSS-NATIONAL DIMENSIONS OF POLITICAL COMPETENCE

EDWARD N. MULLER

State University of New York at Stony Brook

Political efficacy, the belief that the ruled in a political system have some capacity for exercising influence over the rulers, has been studied extensively by political researchers. A selected bibliography compiled by Easton and Dennis in early 1967 contains some thirty books and articles which have dealt in one way or another with political efficacy and its correlates.¹ And this bibliography could be updated considerably.

Substantial theoretic import has been attributed to political efficacy. Easton and Dennis consider the SRC sense of political efficacy construct to be an important determinant of the persistence of democratic regimes. They argue that beliefs in political efficacy provide "a reservoir of diffuse support upon which the system can automatically draw in normal times, when members may feel that their capacity to manipulate the environment is not living up to their expectations, and in special periods of stress, when popular participation may appear to be pure illusion or when political outputs fail to measure up to insistent demands."² A related construct, termed "subjective competence" by Almond and Verba, is based on different indicators but interpreted as substantively equivalent to the SRC construct. On the basis of their analysis of the Five-Nation data, Almond and Verba arrive at the general conclusion that "the self-confident [subjectively competent] citizen appears to be the democratic citizen."³ The concept of political competence, as formulated by Barnes, subsumes political efficacy under the aegis of an individual attribute consisting of "political skills plus the sense of efficacy necessary for effective political action."⁴ Barnes contends that high levels of political competence dispose individuals to prefer democratic styles of leadership, while low levels dispose individuals to

prefer authoritarian styles. On these grounds, he concludes that relatively high levels of political competence are a necessary condition of political democracy.⁵

Although theoretic significance has been attached to political efficacy and to the more general notion of political competence, conceptual ambiguities remain which need to be resolved. Both psychological factors and political skills are components warranting inclusion in any conceptualization of the dimensions of political competence, but the psychological factors, particularly, require careful specification.

Easton and Dennis have observed that "political efficacy appears in three separate although by no means independent guises: as a norm, as a psychological disposition or feeling, and as a form of behavior."⁶ Ambiguity has resulted from failure to distinguish between the SRC sense of efficacy construct—"the feeling that political and social change is possible, and that the individual citizen can play a part in bringing about this change"—⁷ and the Almond-Verba measures of competence. The basic thrust of the SRC questions appears to be toward tapping beliefs in the extent to which the *norm* of political efficacy is actualized in a political system: the sense that the government is responsive to citizens *in general*. By contrast, psychological feelings of confidence, or beliefs on the part of the individual that he himself has the *personal* capacity to wield influence, appear to be the common core of the rather bewildering profusion of competence measures employed by Almond and Verba.⁸

Following the formulations of Barnes and

⁵ Barnes, *op. cit.*, pp. 78-83; see also Ch. 13 of Barnes' *Party Democracy: Politics in an Italian Socialist Federation* (New Haven: Yale University Press, 1967).

⁶ Easton and Dennis, *op. cit.*, p. 25.

⁷ Angus Campbell, Gerald Gurin, and Warren E. Miller, *The Voter Decides* (Evanston: Row, Peterson, 1954), p. 187.

⁸ Their measures of *political competence*—also referred to as *citizen competence* and *subjective civic competence*—and its components of *local* and *national competence*, as well as *local subjective competence* and *national subjective competence*, all include the item pertaining to whether the individual thinks he can personally influence governmental decisions. See Chs. 7-9 in the *Civic Culture*.

⁴ Samuel H. Barnes, "Leadership Style and Political Competence," in Lewis J. Edinger (ed.), *Political Leadership in Industrialized Societies* (New York: John Wiley & Sons, 1967), p. 60.

Easton and Dennis, political competence will be conceptualized here as involving three basic dimensions: (1) a general belief that government is responsive to citizen influence; (2) skills necessary for effective political behavior; and (3) a psychological disposition or feeling of confidence in one's personal ability to influence salient government decisions.

If political competence is to contribute to the development and maintenance of democratic patterns of government, it would seem important that the dimensions of political competence be *congruent*; that is, a pattern of moderately strong interrelationships ought to obtain among them. Conversely, incongruities, might be expected to function as a potential source of stress on democratic government.

Given some motivation for attempting to influence the political process, such as dissatisfaction with political outputs and/or feelings of socioeconomic deprivation, it would seem likely that individuals possessing the rudimentary skills which are a prerequisite for effective influence would be less likely to withdraw support if they believed the government was patterned such that, over the long run, citizen influence over the behavior of public officials was fact rather than illusion. Also, if possession of skills necessary for effective influence were not associated with personal confidence in ability to exert influence, again it might be likely that perception of lack of opportunity to in fact exert influence would contribute to withdrawal of support. Finally, if citizens did not make any connection between the degree to which the government was responsive to the membership in general and their own confidence in being able to exert influence, either set of beliefs might be more susceptible to fluctuation according to circumstances of the moment, thereby introducing a greater potential for stress, than if beliefs in the reality of the efficacy norm buttressed beliefs in personal ability to exert influence.

This research, then, will focus on two major questions. (1) Can political competence be defined cross-nationally by (a) the same general dimensions and (b) equivalent operational indicators of these dimensions? (2) And (most importantly with respect to the relevance of political competence for the functioning of political democracy) is there a cross-national tendency for individuals to generalize from beliefs that the government is responsive to influence from the membership in general, and from possession of political resources necessary for effective influence, to feelings of confidence in their own ability to influence salient government decisions?

The data base for this investigation is the revised 1968 Inter-University Consortium for Political Research issue of the Five-Nation study conducted by Almond and Verba in 1959-60. The Five-Nation interview schedule included numerous items relevant to the measurement of political competence and thus affords a useful extant source for cross-national investigation of the concept.

I. DIMENSIONS OF POLITICAL COMPETENCE

In order to answer the question of whether political competence can be defined cross-nationally by three general dimensions consisting of equivalent indicators, a principal components analysis was performed on the same sixteen items from each nation and the resulting solutions were then subjected to Varimax rotation.⁹ Of course, the samples available for this test are drawn from nations at the upper end of the socioeconomic development continuum; thus the finding can be considered as generalizable mainly to industrialized societies. Table 1 shows the results of the factor analyses of these items for the United States, the United Kingdom, West Germany, Italy, and Mexico. Factor loadings lower than .300 have been excluded in order to facilitate visual interpretation.

It was hypothesized that the first seven items, measuring exposure to political communication in the mass media, attention to political campaigns, political knowledge, and discussion of public affairs, would all correlate strongly with a factor which could be labelled *Political Involvement*; also, it was hypothesized tentatively that items 8 and 9, measuring the individual's beliefs in his ability to understand local and national issues, would load with the first seven items, since these beliefs seem to be concomitants particularly of attention to politics, political knowledge, and political dis-

⁹ Initially, seventeen items were included in the analysis. Variable #127 from the ICPR Five-Nation study issue, measuring respondents' agreement-disagreement with the sense of efficacy proposition, "the way people vote is the main thing that decides how things are run in this country," did not load as hypothesized and was dropped from the analysis reported in this paper. Apparently, the belief that voting decides policy is not a component of the political efficacy dimension which is equivalent cross-nationally. The sixteen variable solutions shown in Table 1 were derived by specifying rotation to three factors. The eigenvalue for the third factor in these solutions is quite close to 1.0.

(PI): Political Involvement (AIG): Ability to Influence Government (PE): Political Efficacy

cussion.¹⁰ These rudimentary political skills consist of activities, cognitions, and beliefs which, according to Milbrath's hierarchy of

¹⁰ The items hypothesized as defining a Political Involvement dimension, as they appear in the ICPR Five-Nation study codebook, are: #23, Follow Government Affairs in Newspapers: 4-point scale, "Nearly Everyday"—low, "Never"—high; #34, Follow Government Affairs on Television or Radio: 4-point scale, "Nearly Everyday"—low, "Never"—high; #25, Follow Government Affairs in Magazines: 3-point scale, "Once a Week or More"—low, "Never"—high; #81, Pay Attention to Campaign: 3-point scale, "Much"—low, "None"—high; #99, Name Party Leaders: 7-point scale, Seven or Six Correct—low, "None Correct"—high; #135, Name Cabinet Positions: 6-point scale, "Five Correct"—low, "None Correct"—high; #26, (Do You) Talk About Government Affairs With People: 4-point scale, "Nearly Everyday"—low, "Never"—high, #31, Understand Local Issues: 5-point scale, "Very

political involvement, define the spectator stratum.¹¹

Further, it was hypothesized that items 10, 11, 12, and 13, which formed the core of the various Almond-Verba competence measures, would all correlate strongly with a factor which could be labelled *Ability to Influence Government*.¹² These items are measures of an indi-

well"—low, "Not at All"—high; #30, Understand Issues Facing the Country: 5-point scale, "Very Well"—low, "Not at all"—high.

¹¹ The hierarchy of political involvement is presented in Figure 3 at page 18 of Lester W. Milbrath, *Political Participation* (Chicago: Rand McNally and Company, 1965).

¹² The items hypothesized as defining an Ability to Influence Government dimension, as they appear in the ICPR Five-Nation study codebook, are: #39, Could Change Bad Regulation: 5-point scale; #40, Would Act on Regulation: 5-point scale; #43, Could You Change Law: 5-point scale; #44, Would You Act on Law: 5-point scale.

vidual's evaluation of his personal ability to influence local and national government decisions perceived as unjust or harmful.¹³

Finally, it was hypothesized that items 14, 15, and 16, similar to the SRC sense of efficacy items, would all correlate strongly with a factor which could be labelled *Political Efficacy*. In contrast to the Ability to Influence Government items, which measure the degree to which individuals believe they could and would try to influence government, the Political Efficacy items are measures of the comprehensibility and responsiveness of government to citizens in general.¹⁴

On the whole, the factor structures for the

Variables 39 and 43 were recoded as follows: "Very Likely"=1; "Moderately Likely"=2; "Likely Only If Others Joined In"=3; "Somewhat Unlikely"=4; "Not at All Likely—Impossible"=5. Variables 40 and 44 were recoded as follows: "Very Likely"=1; "Moderately Likely"=2; "Depends on the Issue"=3; "Somewhat Unlikely"=4; "Not at All Likely—Impossible"=5.

¹³ A situation was defined as follows: "Suppose a regulation were being considered by (specify most local government unit—town, village, etc.) which you considered very unjust or harmful, what do you think you could do." After respondents had reported whether they could do something they were then asked: (1) "If you made an effort to change this regulation how likely is it that you would succeed"; (2) "If such a case arose, how likely is it that you would actually do something about it"; (3) "Have you ever done anything to try to influence a local decision." The initial item in the series (both local and national), whether respondents believed they could do something, was not included in the factor analyses because it formed a 2-point scale; the last item, have you ever done anything, was not included because it is a measure of a more intensive level of participation than Political Involvement, and this level of participation (what Milbrath terms "transitional activities,") is not the subject of this analysis.

¹⁴ The items, as they appear in the ICPR Five-Nation study codebook, are #29, Average Man Understand Government: 3-point scale; #130 Candidates Act After Election: 3-point scale; #132, People Have No Say in Government: 3-point scale. In order to avoid performing factor analysis on unstable phi coefficients, DK responses to all these items were coded as the midpoint on these scales. These variables were recoded so that all scales would run in the same direction; in these instances "Disagree" is low, "Agree" is high.

five countries are characterized by the rather striking clarity with which the hypothesized dimensions emerge. Those items measuring rudimentary political skills consistently define the first factor. There are a few moderate loadings between .400 and .600—three in the United States, four in the United Kingdom, and one each in the remaining three countries; otherwise, the rudimentary political skills items are strongly correlated with a Political Involvement dimension.

The second factor is especially distinct in each country. Without exception, the items measuring an individual's beliefs in his personal ability to influence local and national government decisions are strongly correlated with an Ability to Influence Government dimension.

The third factor is more problematic. In the United States and the United Kingdom this factor is clearly defined by the items measuring beliefs in the efficacy norm. Among Americans, People Have Say in Government is only moderately correlated with the Political Efficacy factor; otherwise, the comprehensibility and responsiveness of government items are strongly correlated with a Political Efficacy dimension in these two countries. Among Germans, Italians, and Mexicans, the government responsiveness items show consistently strong correlations with a Political Efficacy dimension; however, Average Man Understand Government—the comprehensibility of government item—does not load very well on this dimension, and among Germans and Italians, this item shows almost as much association with the Political Involvement factor as with Political Efficacy.

In general, visual inspection of the factor solutions affirms the hypothesis that political competence can be defined cross-nationally by the same dimensions and that these dimensions are operationally equivalent phenomena. Support for this interpretation is provided by the coefficients of congruence between these factor structures. The coefficient of congruence measures the degree to which factor structures for a fixed set of variables are invariant across different populations.¹⁵ Across the five countries the congruence coefficients describing the similarity of the Political Involvement and Ability to Influence Government factor pairings are quite high: the range for Political Involvement is between .995 and .979; for

¹⁵ See Harry H. Harmon, *Modern Factor Analysis* (Chicago: University of Chicago Press, 1967, 2nd Ed.), pp. 268–272. The coefficients are shown in Appendix A.

Ability to Influence Government the range is between .988 and .943. The congruence coefficient for the Political Efficacy factor in the United States and the United Kingdom is also quite high, attaining a value of .964. However, the majority of the congruence coefficients for the other Political Efficacy factor pairings fall between .900 and .800, indicating only moderate congruence, a reflection of the fact that Average Man Understand Government is much less a component of Political Efficacy in West Germany, Italy, and Mexico, than in the United States and the United Kingdom.

A criticism levelled at the analysis of these data by the original investigators was that their approach tended to focus exclusively on comparison between nations, leaving open the possibility that relationships found to exist between whole nations might not hold up or might be altered substantially by within-nation variation due to such factors as geographic and level of urbanization differences.¹⁶ If one is interested in examining interrelationships between dimensions of political competence across different nations, substantial within-nation variation by such variables as region and size of place would have to be taken into account in order to develop theoretically useful generalizations.

The statistical technique employed to investigate regional and size of place effects on the distribution of political competence within nations is one-way analysis of variance, useful when testing for a relationship between a quantified (measured on an interval scale) variable and a qualitative—or higher order—variable. Tables 2-4 show the variation in political competence by region and size of place for the United States, the United Kingdom, West Germany, and Italy (Mexico has not been included because the Mexican sample was not coded by region and is unreliable with respect to size of place).¹⁷ Political Efficacy scores range from -11 to 56; Political Involvement scores range from -05 to 72; Ability to Influence Government scores range from 0 to 55. The direction of these scales is inverse to score magnitude: the lower the score, the higher the level of competence; the higher the score, the lower the level of competence.¹⁸

¹⁶ See the review of the *Civic Culture* by Stein Rokkan in this REVIEW (September, 1964).

¹⁷ The Mexican sample only included towns with populations of 10,000 or more.

¹⁸ The methodology of scale construction is discussed in Appendix B. The Political Efficacy scales are less equivalent across the samples than the other scales because the contribution of the

Due to the inflation of F by sample size, the significance level selected for rejection of the null hypothesis is .01.

A statistically significant F indicates that there are nonchance variations between means somewhere among the groups. The interesting question involves determination of which groups are significantly different. Assuming that the estimates of the population variance for each group meet the assumption of homoscedasticity, that is, are equal, then a significant F indicates that the largest difference between group means is necessarily statistically significant. A variety of procedures exist for making other a posteriori comparisons.¹⁹ The method adopted here is that proposed by Scheffé; with regard to Type I error, it is more rigorous than other multiple comparison methods.²⁰

Table 2 shows that Political Efficacy is distributed rather evenly by region and size of place in the four countries. Statistically significant regional variation in Political Efficacy appears only among Italians; significant size of place variation appears only among Germans. Italians residing in central Italy manifest a substantially greater degree of belief in the efficacy norm ($\bar{X}=33.65$) than do their compatriots from the north ($\bar{X}=41.16$) and south ($\bar{X}=41.40$). By size of place in West Germany, Political Efficacy tends to be disproportionately located in large urban areas

Average Man Understand Government component is negligible in West Germany, Italy, and Mexico. Thus, the equivalence of the Political Efficacy scales for all the countries is mainly in terms of beliefs about the responsiveness of government to the membership in general.

¹⁹ The multiple *t* test method has the least to recommend it because there is no way to determine how many of the comparisons which achieve statistical significance are due to chance alone, or to the circumstance that, since the *t* tests cannot be regarded as independent, some results dictate, others. For a useful discussion see William L. Hays, *Statistics* (New York: Holt, Rinehart and Winston, 1963), pp. 375-376 and 471-472.

²⁰ The Scheffé method is relatively insensitive to departures from normality and homoscedasticity, and is applicable to groups of unequal sizes. Its drawback is that it is probably too conservative with regard to Type I error; as compensation, Scheffé recommends that a significance level of .10 be selected. A brief but lucid presentation is in George A. Ferguson, *Statistical Methods in Psychology and Education* (New York: McGraw-Hill Book Company, 1966, 2nd Ed.), pp. 295-297.

TABLE 2. REGIONAL AND SIZE OF PLACE VARIATION IN POLITICAL EFFICACY

MEAN POLITICAL EFFICACY SCORES: BY REGION						
	East(N = 249)	South(N = 312)	West(N = 409)		Mean Square	F

	<20000(<i>N</i> = 354)	20000-100000(<i>N</i> = 329)	>100000(<i>N</i> = 272)	Within	180.35	
West Germany	37.31	37.75	36.90	Between	57.13	0.41 n.s.
	<20000(<i>N</i> = 324)	20000-100000(<i>N</i> = 544)	>100000(<i>N</i> = 127)	Within	141.05	
Italy	37.47	37.92	36.95	Between	56.44	0.39 n.s.
				Within	145.06	

^a The East includes New England and Middle Atlantic States; the South includes South Atlantic, East South Central, and West south Central States; the West includes East North Central, West North Central, Mountain, and Pacific States.

^b The North includes Schleswig-Holstein, Lower Saxony, Hamburg, and Bremen; Central includes Hesse, Baden-Wuerttemberg, North Rhine-Westphalia, and Rhineland Palatinate; the South consists of Bavaria.

varies by region. Among Americans, the difference occurs between the south and the nonsouth: Political Involvement is lower in the south ($\bar{X}=35.72$) than in the east ($\bar{X}=29.90$) and west ($\bar{X}=30.80$).²³ On the average, in the

United Kingdom the English ($\bar{X}=36.51$) and the Scots ($\bar{X}=38.16$) manifest substantially greater levels of the rudimentary political skills which define the Political Involvement dimension than do the Welsh ($\bar{X}=48.50$).²⁴

²³ East, West— $F=0.38$; South, West— $F=12.96$.

²⁴ England, Scotland— $F=0.74$; Scotland, Wales— $F=12.25$.

And in West Germany the level of Political Involvement is greater among Germans residing in the north, whose mean score is 28.07, than among Germans residing in the central and southern regions of the country, whose mean scores are 33.80 and 34.45, respectively.²⁵

Turning to Table 4, it can be seen that Ability to Influence Government is homogeneous by size of place in each of the four countries. By region, in the United States Ability to Influence Government beliefs appear to be located to a greater degree in the east ($\bar{X}=30.01$) than in the south ($\bar{X}=33.96$) and west ($\bar{X}=32.51$).²⁶ The F -ratio for Ability to Influence Government by region among Italians should be regarded with caution, since the condition of heteroscedasticity (unequal variances) obtains between these regions, and may inflate the F -ratio spuriously.²⁷ Tentatively, then, it may be inferred that in Italy the incidence of Ability to Influence Government beliefs is highest of all in the northern region, where the mean score is 35.70, lower in the southern region, where the mean is 38.25, and lowest of all in central Italy, where the mean is 41.38.²⁸

Analysis of variance thus indicates that the three dimensions of political competence are relatively homogeneously distributed by region and size of place in the four countries studied: differences clearly appear, but they do not define consistent disproportionate location of political competence either in certain geographic regions or in certain communities differentiated by degree of urbanization. The regional differences which appear in the United States on Political Involvement and Ability to Influence Government are mixed rather than

exclusively south versus nonsouth. Among Germans, size of place affects the distribution of Political Efficacy and Political Involvement, but these effects are mixed; the size of place difference on Political Efficacy occurs between small town-rural areas and medium-size towns versus large urban areas, whereas the Political Involvement difference pits small town-rural areas against medium-size towns and large urban areas. Although Political Efficacy and Ability to Influence Government differ by region in Italy, the effect of region is mixed, levels of Ability to Influence Government appearing to be highest in northern Italy, somewhat lower in the south, and lowest in the central region, whereas levels of Political Efficacy are greater in central Italy, as opposed to the north and south. (The findings that Political Efficacy and Ability to Influence Government are *not* consistently lower in south Italy than in central and northern Italy and that Political Involvement is *evenly* distributed across the whole of Italy, support Kogan's criticism of the LaPalombara-Tarrow thesis that Italian political culture is sharply divided between north and south; Kogan points out that the Five-Nation data do not show sharp differences on many political culture variables and he argues that, in general, the dualistic political culture thesis is an exaggeration.)²⁹

Since consistent regional or size of place imbalances in political competence do not appear within the four countries, subsequent analysis will focus on relationships between the competence dimensions within each country as a whole. The finding of homogeneity with respect to levels of urbanization is interesting from a substantive point of view because it is consistent with Neubauer's thesis that, among nations which have developed beyond a socioeconomic threshold supportive to political democracy (a class which includes each of these nations), factors such as urbanization will have little effect on the development and maintenance of democratic patterns of government.³⁰ As the growth of political competence

²⁵ North, Central— $F=15.21$; Central, South— $F=0.18$.

²⁶ East, West— $F=5.29$; South, West— $F=1.96$.

²⁷ Where groups are of unequal sizes and a single test is desired of the hypothesis that $\sigma_1^2 = \sigma_2^2 = \dots = \sigma_k^2 = \sigma^2$, the appropriate method is the Bartlett test for homogeneity of variance, described at pages 193-194 of Helen M. Walker and Joseph Lev, *Statistical Inference* (New York: Holt, Rinehart and Winston, 1953). The test yields a statistic B which has a chi-square distribution with $k-1$ degrees of freedom. The B value for Ability to Influence Government by region is 27.23. This is substantially greater than the chi-square value required for rejection of the null hypothesis at the .001 level, which is 13.8. Therefore, considerable lack of homogeneity is indicated.

²⁸ North, South— $F=9.00$; Central, South— $F=8.41$.

²⁹ See Norman Kogan's review of Sidney G. Tarrow, *Peasant Communism in Southern Italy* (New Haven: Yale University Press, 1967) in this REVIEW (December, 1968). Kogan's criticism is confined to Tarrow's presentation of the dualistic culture thesis, but LaPalombara's view is apposite with that of Tarrow; see Joseph LaPalombara, "Italy: Fragmentation, Isolation, and Alienation," in Lucian W. Pye and Sidney Verba (eds.), *Political Culture and Political Development* (Princeton: Princeton University Press, 1965).

³⁰ See Deane E. Neubauer, "Some Conditions

generally is considered conducive to political democracy, Neubauer's thesis would imply the lack of relationship found here.

The finding that levels of Political Involvement do vary by region in three of the four countries is also of substantive interest, although explanation of this pattern is not a simple matter. Region is a surrogate variable; factors such as differences in levels of industrialization, communications development, education, and income, as well as differences in political history and traditions, may be reflected in the differential distribution of Political Involvement by region in the United States, the United Kingdom, and West Germany. Detailed investigation of which factors are responsible for the effect of region is not a purpose of this paper. However, it may be that subcultural attitudes of regional separatism are responsible for much of the effect of region on Political Involvement in the United States and the United Kingdom. The Political Involvement scale measures mainly involvement in national politics. Regions with a history of separatist sentiment such as the southern United States and Wales might be expected to show lower levels of *national* political involvement than regions without such traditions. Separatism is still very much a part of the political history of the American South. And Welsh nationalism is distinctive in the United Kingdom. Alford states that "Welsh nationalism is apparently growing, not dying," and cites evidence pointing to the conspicuousness of Welsh separatism: "If language can be considered a crucial index of the cultural basis for regional separatism, then clearly Wales ranks higher than Scotland; for in 1931, 37 per cent of the Welsh population spoke Welsh, while only 2 per cent of the Scottish population spoke Gaelic."³¹

II. RELATIONSHIPS BETWEEN DIMENSIONS OF POLITICAL COMPETENCE

Circularity of influence surely operates among the three dimensions of political competence. However, the presumption in the following analysis is that Political Efficacy and Political Involvement function largely as antecedents of Ability to Influence Government. Setting Political Involvement prior to Ability to Influence Government entails an assumption which seems plausible enough: that the

major path of causation involves a relationship in which the characteristics that define Political Involvement are political resources which should contribute to the individual's development of confidence in his personal ability to wield influence over salient political decisions.

The placement of Political Efficacy is more questionable. Among adults, generalization from confidence in personal political potency to confidence in the overall responsiveness of the government might be expected to occur. However, Easton and Dennis have shown that, in the American political system, a coherent structure of beliefs in the overall responsiveness-nonresponsiveness of the government to citizen influence is inculcated in children (at least white middle-class children) at an early age.³² On the basis of their findings (admittedly a flimsy empirical base at this stage—but by no means implausible), the assumption adopted here is that the major path of causation between Political Efficacy and Ability to Influence Government involves a relationship in which beliefs about the extent to which the efficacy norm is a reality in the political system, inculcated in children through processes of conditioned learning, affect adult confidence

³² Easton and Dennis, *op. cit.*, esp. pp. 29-33. As the authors note at page 31: "The most important conclusion emerging from our principal component analysis is that by grade 3 children have already begun to form an attitude, as revealed in the five high-loading items, which we could call a sense of political efficacy. This basic orientation is likely to become crystallized early in the life of the individual and to be maintained at least through these grades. This does not say, of course, that the third-grade child has developed a *high* sense of political efficacy, nor does it assert that any particular proportion of them experience this sentiment at any level of intensity. It only says that an attitude structure has begun to take shape among the children in their early years." Data on the direction (positive-negative) of efficacy beliefs among children in the United States, the United Kingdom, Italy, and West Germany is reported in Jack Dennis, Leon Lindberg, Donald McCrone, and Rodney Stiefbold, "Political Socialization to Democratic Orientations in four Western Systems," *Comparative Political Studies* (April, 1968). These authors are concerned with whether there is an upward or downward trend in the aggregate level of positive efficacy feelings among children from youngest to oldest in the four countries. Their study does not focus on the age at which children acquire a coherent structure of beliefs about the efficacy norm.

of Democracy," this REVIEW (December, 1967).

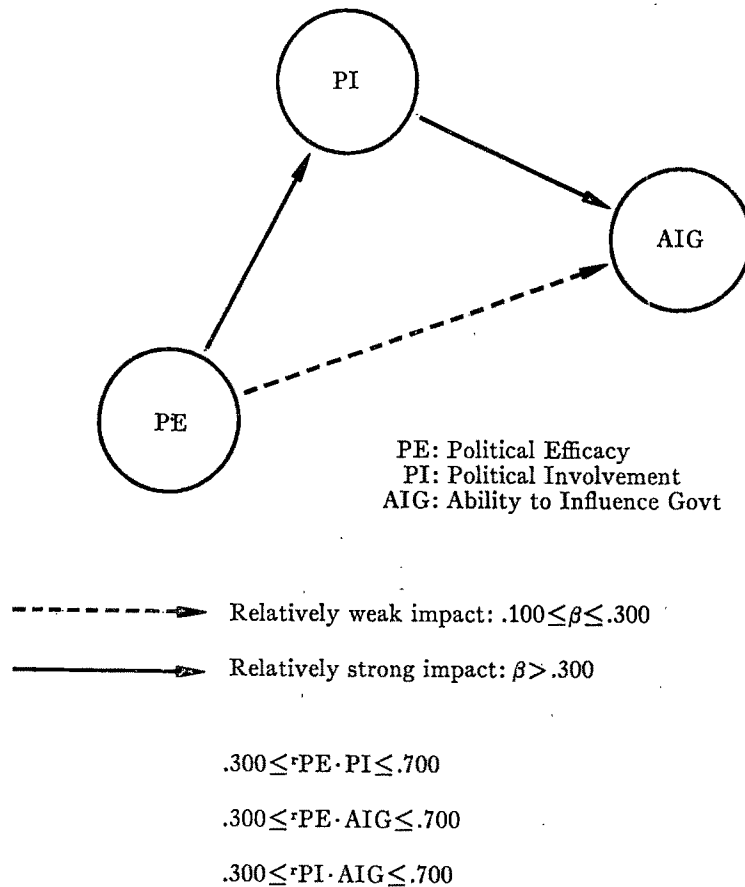

FIGURE 1. Hypothetical causal relationships between dimensions of political competence

in personal political potency. Also, given that beliefs in the efficacy norm are learned at an early age, it is logical to assume that these beliefs will have an important effect on the degree to which adults become motivated to acquire the rudimentary political skills which are a prerequisite for effective influence. Here, the assumption is that the inculcation of beliefs in the efficacy norm will dispose members to feel that there is some payoff in becoming politically involved.

Thus, in the following analysis a particular causal ordering is *assumed* and the purpose is to discover, given the assumed sequence, the linkages which apply to each of the five nations. Instead of utilizing Blalock's rather tedious search procedure, the method employed here is the more straightforward technique of path analysis.³³ Having assumed causal se-

quence, unmeasured variables as residual factors, and uncorrelated residuals, path analysis, as Duncan has pointed out, "amounts to a sequence of conventional regression analyses, and the basic theorem becomes merely a compact statement of the normal equations of regression theory for variables in standard form."³⁴

The set of relationships between the political competence dimensions which is assumed to be most conducive to the development and maintenance of democratic government is displayed graphically in Figure 1. The upper limit of the hypothesized gross effects between the variables has been set at .700. Beyond this level the competence dimensions would merge empirically.³⁵ The pattern of net effects, as estimated by the beta weights (β), is hypothe-

sized as follows: PE should have relatively substantial impact on PI, PI should have relatively substantial impact on AIG, and the impact of PE on AIG will be largely indirect, through PI.³⁶ The proposed model is hierarchical.³⁷ To be sure, a reciprocal model, allowing the competence variables to be both cause and

effect of each other, would do better justice to reality; however, estimation of such linkages presents a difficult empirical problem.³⁸ Presumably, the ordering adopted represents the major causal paths involved.

Table 5 presents the five-nation intercorrelation matrices for the competence variables. In the United States the correlations are relatively strong. The relationship between PE and AIG is rather weak in the United Kingdom; otherwise, a pattern of moderate relationships obtains for the United Kingdom and West German samples. A quite different pattern emerges among Italians and Mexicans. The only substantial correlation in Italy and Mexico is between PI and AIG. PE and PI are related slightly in both countries. There is no relationship at all between PE and AIG.

In the United States, the United Kingdom, and West Germany the correlations between the competence variables fall, with one exception, within (or almost within in the case of PE and AIG among Germans) the parameters assumed to be conducive to the development and maintenance of democratic government. Among Italians and Mexicans, only the correlations between PI and AIG are greater than the lower boundary of the parameters specified.

The lack of relationship between PE and AIG in Italy and Mexico means that in these countries individuals make no connection between their own sense of political potency and the receptivity of their governments to influence from the general membership. It may be that the phenomenon of *Clientelismo*, discussed by Tarrow with respect to southern Italy, is partially responsible in both countries for the lack of association between PE and AIG (as well as the slight association between PE and PI). According to Tarrow, under the system of *Clientelismo* "an individual is linked to the authority structure through personal ties of obligation and loyalty, rather than through the merger of his interests with others of the same social group or ideological persuasion. . . . *Clientelismo* differs from a true system of representation, although it can adapt to an electoral system, and it deals in the satisfaction of personal interests."³⁹ This type of system, to the extent that it is perceived as operative, would not encourage members to associate their beliefs in the responsiveness of government to the members in general with their perception of their own ability to influence political decisions.

³⁸ See the discussion in *ibid.*, at p. 1261, note 11 and the literature cited therein.

³⁹ Tarrow, *op. cit.*, p. 74.

³⁶ Indirect effects are computed by multiplying the path coefficients along a given chain of causation. See Duncan, *op. cit.*; also see Peter M. Blau and Otis Dudley Duncan, *The American Occupational Structure* (New York: John Wiley & Sons, Inc., 1967), Ch. 5.

³⁷ An excellent discussion of hierarchical models, as well as causal modelling in general, is in Hugh Donald Forbes and Edward R. Tufte, "A Note of Caution in Causal Modelling," this REVIEW (December, 1968).

FIGURE 2. Causal relationships between Political Efficacy, Political Involvement, and Ability

Figure 2 shows the beta weights, generated from recursive regression equations, which estimate the path coefficients for the simple three variable model in each country.⁴⁰ The path coefficient describing the impact of a standard unit PE change on PI is numerically the same as the correlation coefficient between these variables because, for the two variable case, $\beta = r$.

Again, in the United States, the United Kingdom, and West Germany the path coefficients fall within the parameters hypothesized as conducive to democratic political development and stability (the path coefficient of .293 which describes the direct impact of PI on AIG in the United Kingdom is quite close to the .300 value arbitrarily selected as indicative of moderately strong impact). The causal linkages between the competence variables for these three countries fit the hypothesized pattern of net effects. Examining Figure 2 in conjunction with Table 6, it can be seen that the impact of PI on AIG is sizeable and largely direct in all three countries. The net effect of PE on AIG is relatively slight. In the United States the effect of PE on AIG is largely indirect, through PI. The United Kingdom presents a slight exception to the expected pattern, since the indirect and direct effects of PE on AIG are of approximately equal magnitude. Germans are even more of an exception to the expected pattern: roughly two-thirds of the gross effect of PE on AIG is direct. In general, however, the pattern of direct and indirect effects between these variables is consistent with the hypothesized model.

Among Italians and Mexicans only the net effect of PI on AIG is consistent with the parameters assumed to be conducive to democratic development and stability. The impact of PI on AIG is completely direct; PE, of course, has no measurable impact on AIG.

Two differential patterns emerge from these

⁴⁰ The comparability of beta coefficients across different samples, because the beta coefficients share the same dimensionality as correlation coefficients, can be distorted by unequal variances. Some of the estimates of the population variance for the competence scales do show statistically significant differences among the samples, but the magnitude of these differences is not large. Examination of the partial regression coefficients, which are not affected by unequal variances, suggests that the patterns of impact inferred from the beta coefficients (standardized partial regression coefficients) are not substantively affected by any departures from homogeneity of variance among the samples.

TABLE 6. CALCULATION OF INDIRECT EFFECTS OF POLITICAL INVOLVEMENT ON ABILITY TO INFLUENCE GOVERNMENT AND POLITICAL EFFICACY ON ABILITY TO INFLUENCE GOVERNMENT: FIVE NATIONS

$r_{PI \cdot AIG} = P_{AIG \cdot PI} + (P_{PI \cdot PE})(P_{AIG \cdot PE})$		
(gross)	(direct)	(indirect)
United States:	.558 = .504 + .054

data. In the United States PE has substantial direct impact on PI: a unit change in PE (one standard deviation) will produce a .4 unit change in PI. PI has even greater impact on AIG: a unit change in PI will produce a .5 unit change in AIG. Also, PE has a slight direct, and even greater indirect, impact on AIG. Americans learn to believe that their political system is responsive to citizen influence at an early age. As adults, their belief in the reality of this norm encourages them to develop the rudimentary political skills necessary for some degree of effective influence. And possession of these rudimentary skills, as well as beliefs in the responsiveness of their government, dispose them to feel that, in situations where political laws and regulations are being proposed of which they disapprove, they have the personal potential to in some way exercise influence over the outcome of the decisional process.

Basically the same pattern is operative in the United Kingdom and West Germany. The difference between the causal linkages which apply to these two countries and those which apply to the United States is a difference of degree rather than kind. The net impacts between the variables are larger in the United States than in the United Kingdom and West Germany. And the explanatory power of the simple three variable model is considerably greater in the United States than in the other two countries. However, the causal processes are similar and the patterns of effects generally

fall within the parameters suggested as supportive of democratic government. The relatively low gross explanatory power of the model among Britons, as well as the lower than expected indirect effect of PE on AIG, through PI, may be attributable in part to attitudes of deference toward political authority which permeate British political culture.⁴¹ The fact that the gross explanatory power of the model *does* attain moderate magnitude among Germans may reflect efforts by German political authorities to promote adherence to democratic norms through political socialization processes. The largely direct, rather than indirect, impact of PE on AIG might be a reflection of the short duration of the socialization process in West Germany: many German adults may not have developed beliefs in the efficacy norm as children and then been motivated by these beliefs to acquire rudimentary skills necessary for influence: rather, their socialization to the norm, having occurred later, at a time when their levels of Political Involvement were more established, might thus have a more direct impact on their perceptions of personal ability to influence salient government decisions.

The other pattern, which applies to Italy and Mexico, is presumably less supportive of democratic government. Italians and Mexicans who possess the skills necessary for effective influence do tend to believe that they can exercise influence; and this is likely an important linkage—politically involved Italians and Mexicans at least do not feel particularly thwarted with respect to their perception of the potential effectiveness of their own efforts to influence the political process. However, as far as the inculcation of beliefs in the responsiveness of the government to citizen influence is concerned, if the Easton-Dennis findings are not just unique to the American political system, the Italian and Mexican systems are characterized by a discontinuity in the socialization process. Politically involved citizens who feel confident of their ability to influence the political process are little more likely than their apathetic and less confident compatriots to believe in the reality of the efficacy norm. And were the politically involved (and therefore politically relevant) members to find that their Ability to Influence Government beliefs did not match well with reality in specific situations, beliefs in the efficacy norm would provide little amelioration of their discontent.

Of course, actually testing the effect of

congruence between competence dimensions on democratic development and stability is not possible with the Five-Nation data. The inferences made about the effects of the different competence patterns must remain speculative. However, if the inferences drawn here are at all plausible, it would be expected that the two different patterns of congruence between competence dimensions would be reflected in rank order differences on measures of political stability-instability for the United States, the United Kingdom, and West Germany as opposed to Italy and Mexico. Utilizing National Political Instability Profiles for 1948–65 as a measure of stability-instability, these expectations are generally borne out. On the scale constructed by Feierabend, Feierabend, and Nesvold, which ranges from a score of 1 for the most stable systems to a score of 6 for the least stable, the United Kingdom and West Germany show a score of 3, while Italy and Mexico are in an interval lower at position 4.⁴² The exception is the United States, which shows a score of 4, thus falling at the same interval as Italy and Mexico, instead of ranking with the United Kingdom and West Germany, as should be the case if the inferences made here about the effect of congruence between competence dimensions were absolutely correct. Moreover, if the stability-instability scores are averaged so as to produce a more normal distribution, the United Kingdom and West Germany rise to a score of 2 (only Luxembourg and the Netherlands receive a score of 1), Italy and Mexico rise to a score of 3, but the United States remains with a score of 4. Finally, on a cumulative 1948–61 political violence scale developed by Nesvold, West Germany and the United Kingdom rank at the low end of the continuum and Italy and Mexico rank in the middle, as would be expected, but the United States, in contrast to expectations, ranks in the middle with Italy and Mexico. (The scale scores range from 0–113; the scores for the five nations are: West Germany=8, United Kingdom=21, United States=30, Italy=32, Mexico=36.)⁴³

⁴² See Tables 18–1A and 18–1B at pages 623–25 of Ivo K. Feierabend, Rosalind L. Feierabend, and Betty A. Nesvold, "Social Change and Political Violence: Cross-National Patterns," in Hugh Davis Graham and Ted Robert Gurr (eds.), *Violence in America* (New York: Signet Books, 1969).

⁴³ This scale appears as Table 7 at page 181 of Betty A. Nesvold, "Scalogram Analysis of Political Violence," *Comparative Political Studies* (July, 1969).

⁴¹ See the discussion in Almond and Verba, *op. cit.*, pp. 493–494.

The United States is clearly an important deviant case. The closest fit to the hypothesized competence model appears in the American data; yet the inference drawn from the model is not supported by American stability-instability scores. The implication is obvious: variables not considered in the simple model investigated here must be taken into account in future research concerned with the stability-instability of political systems. (Such variables, it is assumed, would not substantially affect the relationships internal to the competence model.) Nevertheless, the stability-instability scores of the other four countries *are* in line with expectations derived from the competence model. This certainly suggests that there is validity in the broad generalization specifying congruence between competence dimensions as conducive to democratic development and stability.

III. CONCLUSION

In this paper three dimensions of political competence have been identified which are distinct and operationally equivalent across five nations.⁴⁴ The analytical distinction has been made, and sustained empirically, between an individual's sense of confidence in his personal ability to influence government decisions, and his beliefs in the capacity of members of his political system in general to influence government—beliefs which involve a sense of satisfaction with the responsiveness of political authorities to the membership over the long

⁴⁴ A study utilizing the same data base but with different theoretical concerns is the research reported in two parts by Norman H. Nie, G. Bingham Powell, Jr., and Kenneth Prewitt, "Social Structure and Political Participation: Developmental Relationships, I," this REVIEW (June, 1969) and "Social Structure and Political Participation: Developmental Relationships, II," *ibid.*, (September, 1969). The Ability to Influence Government dimension identified here is similar to the construct which they label Political Efficacy; the exception is that the first two items of their scale were found to load on the factor labelled Political Involvement in this analysis. The Political Involvement dimension also includes items which Nie *et al.* used to define measures of Political Information and Political Attentiveness, as well as one item of their Political Participation construct. The fact that their Political Information and Political Attentiveness constructs are unidimensional within each sample is not surprising, and this finding is certainly useful from the point of view of parsimony in causal analysis.

run. This is a distinction which largely has been overlooked in the research on sense of efficacy and political competence, but it is a distinction which has theoretical and explanatory relevance.

When variation in political competence by region and size of place was examined, it was found that the three dimensions of competence show little tendency toward consistent disproportionate location by these variables within the four nations investigated. The overall impression is one of within-nation homogeneity.⁴⁵

The competence dimensions were found to be moderately to strongly interrelated in the United States, the United Kingdom, and West Germany. By contrast, in Italy and Mexico only Political Involvement and Ability to Influence Government show sizeable correlation; Political Efficacy and Political Involvement are correlated only slightly and there is virtually no measurable relationship between Political Efficacy and Ability to Influence Government.

When causal structure is imputed to these dimensions, two different patterns are apparent. One, which applies most strongly to the United States sample, and to a lesser but still relatively substantial degree to the United Kingdom and West German samples, involves a process wherein beliefs in the reality of the efficacy norm encourage individuals to acquire the rudimentary political skills and dispositions necessary for the exercise of effective influence: in turn, possession of these political resources affects the degree to which individuals feel confident of their personal ability to influence salient government decisions; and beliefs in the efficacy norm affect sense of personal political potency to some extent directly, but equally or to a greater extent indirectly, through the process of having acquired rudimentary political skills. Presumably, this pattern is supportive of political democracy. The other pattern, presumed to be a potential source of stress on democracy, applies to the Italian and Mexican samples. This pattern is characterized by what may be a discontinuity in the social-

⁴⁵ In "Social Structure and Political Participation: Developmental Relationships, II," Nie *et al.* report at page 819 that size of place shows a slight but consistently negative relationship with their attitude items: i.e., the greater the community size the lower the citizen's involvement and sense of personal political potency (see Appendix III). However, most of the path coefficients are less than .100 and are probably not statistically significant.

TABLE A1. COEFFICIENTS OF CONGRUENCE: FIVE-NATION POLITICAL COMPETENCE FACTOR SOLUTIONS

		United Kingdom			West Germany			Italy			Mexico		
		I	II	III	I	II	III	I	II	III	I	II	III

	III										.090	.005	.952

zation process. The politically involved and personally confident members have not developed beliefs in the reality of the efficacy norm in their system; thus, if sense of personal potency were found to match poorly with reality, among these members there would be little potential for amelioration of discontent by beliefs in the long term responsiveness of government to citizen influence.

The model examined included only three variables. Intensive investigation of antecedents and consequences of political competence is beyond the scope of this paper.⁴⁶ In general, the data reported here point to the importance, in future research, of distinguishing between beliefs in the regime norm of efficacy, and sense of personal confidence in ability to influence government decisions. Possession of political resources necessary for effective influence may, as would be expected, affect the development of confidence in personal political potency on a cross-national basis. But the development of beliefs in the overall responsiveness of government to citizen influence, presumably an attitude of some consequence for democratic government, particularly in complex modern societies, may be substantially more variable, depending upon the content and timing of socialization processes.

APPENDIX A

The Coefficient of Congruence

The coefficient of congruence ranges from +1

⁴⁶ See the two Nie et al. articles for investigation of the social structure antecedents of political competence.

for perfect factorial similarity, through 0 for the complete absence of factorial similarity, to -1 for perfect inverse factorial similarity. Harmon recommends "that each factor of one study be compared with all the factors of the other study, and be paired with the one with which it has the highest coefficient of congruence."⁴⁷ The italicized values in Table A1 represent the pairings of factors showing the largest coefficients of congruence. If a set of factor solutions obtained from the same variables for different samples are to be considered congruent, the largest coefficients should appear in the diagonals of the sub-matrices for the pairing of each factor structure against every other.

APPENDIX B

Scale Construction Procedures

Factor analysis is useful not only as a technique for identifying dimensions hypothesized to underlie sets of variables, but also as a data reduction device. Factors can be scored and the resulting constructs are then the kind of multi-item indicators most appropriate for comparative research. The method recommended by Harmon for describing factors in terms of the observed variables is the technique of complete estimation.⁴⁸ This procedure has been used here to assign factor scores to each respondent on the dimensions of political competence. The complete estimation approach employs conventional regression methods to obtain esti-

⁴⁷ Harmon, *op. cit.*, p. 271.

⁴⁸ See *ibid.*, pp. 350-60.

mates of factor measurements. Harmon expressed the basic formula as follows:

$$\bar{F}_p = \beta_{p1}Z_1 + \beta_{p2}Z_2 + \dots + \beta_{pn}Z_n^{49}$$

where \bar{F} is the factor score on any one factor constituted by p variables; and the β 's are standardized factor coefficients comparable to the beta weights yielded by multiple regression. The size of the β 's is determined by the loading of the variables on the factor: variables which have the highest factor loadings will contribute the most to an individual's score on that factor, variables which show the lowest loadings will make the least contribution to his score. Such scales should prove quite useful for comparative research because (1) they are multi-item indicators; (2) they are quantitative variables with some degree of discriminatory power; and (3) they are linear combinations of items which take into account the fact that particular items can be expected to relate differentially to an underlying or latent common dimension, i.e., in contrast to such scaling procedures as the Likert method, factor scores obtained by complete estimation are not based on the arbitrary assignment of equal weight to each component item.

If there were reason to believe that, theoretically, the three dimensions of political competence should be uncorrelated, then Political Efficacy, Political Involvement, and Ability to Influence Government could be measured directly from the orthogonally rotated solutions. However, the opposite is the case; theoretically, these competence dimensions should be correlated. Therefore, while orthogonal rotation has been employed to test the hypothesis that political competence involves three distinct dimensions, in order to measure these dimensions, the items which define them have been subjected to principal components analysis separately, with the minimum eigenvalue set at 1.0. This procedure forces a maximum of the variance onto the first factor, which should be (and was in the case of these sets of competence items) the only factor

on which the variables load. The result, in each case, is a scale which is a linear combination of only those variables identified as common to one dimension by varimax rotation, and is thus uncontaminated by any secondary loadings from other variables common to other dimensions.

Of course, since it is expected that the competence dimensions will be correlated, a better approximation to simple structure could be obtained by oblique rotation. If, for instance, Carroll's Biquartimin solution had been used, with γ set at .5, the primary loadings presumably would have been somewhat higher and the secondary loadings somewhat lower, thus resulting in factors of even greater clarity. A major drawback to oblique rotation, however, is the fact that sampling fluctuations play a part in determining oblique solutions: "To some extent at least the obliqueness of the axes in any one study is determined by sampling instability and the angular separations can be expected to fluctuate from sample to sample."⁵⁰ A further drawback to oblique rotation is that factor loadings, which in the case of orthogonal rotation can be interpreted as measures of the degree to which variables are correlated with underlying dimensions, lack precision of meaning in oblique rotations.⁵¹

Primarily because of its questionable comparability across samples, oblique rotation was not deemed suitable for the objectives of this analysis. Orthogonal rotation was selected because of its invariance under conditions of sampling instability. However, regardless of which solution were used to identify the common dimensions, the best measurement procedure would still be to develop scales from separate principal components analyses of items common to each dimension; this ensures that each scale is measuring only what it is supposed to measure.

POLITICAL DEVELOPMENT AND LERNER'S THEORY: FURTHER TEST OF A CAUSAL MODEL*

GILBERT R. WINHAM
McMaster University

A current concern in the theory of political development is the relationship between political democracy and economic and social variables. Various writers have hypothesized, for example, that the development of democratic political institutions is related to increasing levels of education, communications, and urbanization.¹ Daniel Lerner has developed this argument further in stating that a developmental sequence occurs with increasing urbanization leading in turn to higher levels of education, communications development, and finally political development.² This theory has been tested and corroborated in research which employed statistical causal modeling methods on contemporary data gathered over a large number of nations.³ The purpose of

this paper is to test the adequacy of Lerner's model with data gathered over time in a single nation, which presents a research situation more congruent with the actual temporal processes of political development.

I. THEORY OF DEMOCRATIC POLITICAL DEVELOPMENT

Political development will be used here to mean the development of democratic political institutions and processes. This definition is admittedly stipulative, and does not preclude the argument that political development could occur without increasing levels of democracy. By democracy, we will accept Lipset's formulation that:

Democracy in a complex society may be defined as a political system which supplies regular constitutional opportunities for changing the governing officials and a social mechanism which permits the largest possible part of the population to influence major decisions by choosing among contenders for political office.⁴

More precisely, democracy will be taken to mean a political system characterized by representative decision-making *institutions*, by mass *participation* in the selection of decision-makers, and by open *competition* in both the electoral and policy-making processes.

The conditions which bring about democratic political development have been the subject of considerable research. Since the development syndrome is exceedingly complicated, various approaches have been taken in an attempt to

Not until the third phase, when the elaborate technology of industrial development is fairly well advanced, does a society begin to produce newspapers, radio networks, and motion pictures on a massive scale. This, in turn, accelerates the spread of literacy. Out of this interaction develop those institutions of participation (e.g. voting) which we find in all advanced modern societies." p. 60.

² Daniel Lerner, *The Passing of the Traditional Society* (Glencoe: The Free Press, 1958). The essence of Lerner's theory can be found in the following quotation:

"The secular evolution of a participant society appears to involve a regular sequence of three phases. Urbanization comes first, for cities alone have developed the complex of skills and resources which characterize the modern industrial economy. Within this urban matrix develop both of the attributes which distinguish the next two phases—literacy and media growth. There is a close reciprocal relationship between these, for the literate develop the media which in turn spread literacy. But, literacy performs the key function in the second phase. The capacity to read, at first acquired by relatively few people, equips them to perform the varied tasks required in the modernizing society.

unravel it. For example, a link has been postulated between economic development and political development.⁵ Some writers have stressed the attitudinal component of democracy, and argued that a democratic system is produced and maintained through the development of a participant culture.⁶ The psychological dimension of development has been explored, with the resulting hypothesis that an increase in the achievement motivation in a society can result in increasing levels of economic growth.⁷ Finally certain socio-economic factors such as literacy or industrialization have been singled out as being an important part of the development process.⁸

Given the present rudimentary state of social theory-building, it is difficult to assess which line of inquiry is most useful in accounting for political development. However it appears that development theory has become most refined in dealing with certain socio-economic factors, perhaps because data are most easily gathered on these variables. This emphasis is likely not unjustified, given the concern for socio-economic factors by those who have dealt with the attitudinal components of political development.⁹ The remainder of this paper will concern itself with the relationship between three socio-economic variables—namely, urbanization, education, and communication—and democratic political development.

The link between the above variables and political democracy has been systematically tested by Lipset. Lipset divided a sample of 50 nations drawn from Latin America and Europe into two categories: stable democracies, and unstable democracies or dictatorships. By comparing these

two groups, he demonstrated that the democratic countries have higher levels of urbanization, educational attainment, and communications infrastructure.¹⁰ Lipset's study is very useful as a preliminary analysis, but it is limited by his operational definition of democracy as a dichotomous variable. According to his scheme, system nations are either democratic or they are not, an assumption which goes contrary to the more generally accepted notion of democracy being on a continuum. Cutright has developed a more useful measurement of democratic political development by assigning points to nations according to whether they fulfill certain criteria of democratic government.¹¹ This measurement has the advantage of differentiating nations as more or less democratic. It has the additional advantage of allowing for "backsliding" (i.e., decreases in democracy) which is an important feature when the scale is used to measure the development of democracy over time.

Cutright has correlated his political development scale with various measures of urbanization, education and communications gathered over 76 nations for the year 1960. For these measures (i.e., education, communications) composite indicators were used—for example, education was measured by combining the number of literacy and university students per 1,000 in each nation. All items used by Cutright were scored, and the composite measures were derived

⁷ David C. McClelland, *The Achieving Society* (Princeton: D. Van Nostrand Co., 1961). McClelland makes no mention of political development or democracy in his work; however, if economic growth is related to political development, then the possibility clearly exists of a link between the achievement motive and political development.

⁸ The distinction between different approaches in the theory of development, and the relative contributions thereof, was suggested by Harvey Pasis in oral discussion.

⁹ For example, Almond and Verba point out the importance of education and industrialization in creating a democratic culture. Almond and Verba, *op. cit.*, p. 373.

¹⁰ Lipset's indicators for communication (telephones, radios and newspapers per 1,000 people) were subsumed under his category of "wealth."

¹¹ Phillips Cutright, "National Political Development," in Nelson Polsby *et al.* (eds.), *Political Social Life* (Boston: Houghton Mifflin, 1963), pp. 582. According to Cutright's scale nations receive two points per year that a legislature existed in which the lower or only house contained representatives of two or more political parties and the minority party or parties having at least 10 per cent of all seats. Nations receive one point if the above conditions are met except the 10 per cent rule, and no points if the above conditions are not met. Additionally, one point per nation is awarded for each year that a chief executive held office by virtue of a direct vote in an open election in which he faced competition; or in office having been chosen by a political party in a two or multiparty system such as would gain two points on the legislative point assignment scheme. No points are assigned for years in which a chief executive existed by virtue of any other selection process. Cutright's scaling period covered 22 years (1940-1961), and it was possible for a nation to accumulate anywhere from 0 to 66 points.

TABLE 1. MATRIX OF CORRELATIONS OF CUTRIGHT'S MEASURE OF POLITICAL DEVELOPMENT, AND LEVELS OF EDUCATION, COMMUNICATION AND URBANIZATION

	1	2	3	4

Figures for levels of agricultural employment are omitted.

by summing the T scores for individual items.¹² The correlations derived in the Cutright study showed a strong relationship existed between the socio-economic variables and political development, as well as a strong interrelationship between the independent variables themselves; see Table 1.

The data generated by Cutright formed the basis for a further refinement in development theory. Working from Lerner's earlier conceptualization of the development of democracy, McCrone and Cnudde applied to Cutright's findings statistical techniques which are designed to test the empirical validity of alternative developmental sequences. In successive tests, these analysts found that the developmental sequence which best fit the data was the causal ordering implicit in the Lerner theory; see Figure 1. Furthermore not only was this sequence the best fit among alternative possibilities, but it was sufficiently close to corroborate the Lerner model.

The entire drift of development theory as outlined above, and particularly in the way it has been operationalized and tested, has been challenged by Neubauer in a recent article.¹³ Neubauer objects to Cutright's index of democracy on the grounds that it overweights the institutions of democracy and gives insufficient consideration to certain performance traits of democratic regimes, namely electoral equality and competition.¹⁴ A specific difficulty with Cut-

¹² T scoring is a procedure for deriving standardized measures of variables, so that scores on such disparate items as per cent of population in cities over 50,000, number of radios per 1,000 population, and per cent of population literate can be directly compared. See Allen L. Edwards, *Statistical Methods*, 2nd Ed. (New York: Holt, Rinehart and Winston, 1967), Chapter 4.

¹³ Deane E. Neubauer, "Some Conditions of Democracy," this REVIEW, 61 (1967), 1002-1009.

¹⁴ Neubauer's concern for these features of de-

FIGURE 1

Numbers indicate correlation coefficients. Developmental sequence shown by solid lines.

right's scale is that it does not adequately differentiate between those nations which receive maximum scores for political development. By employing indicators such as per cent enfranchised, equality of representation, and measures of party competition, Neubauer has developed an alternative index of democracy, one which is capable of differentiating between nations generally considered "democratic."

In statistical tests employing his index of political democracy, Neubauer finds very little correlation between his index and Cutright's ($r = .182$) which confirms that these two measures are not in fact measuring the same thing. In relating his index to socio-economic variables, Neubauer found virtually no correlation between political democracy and urbanization or education, and a considerably smaller correlation between democracy and communications than reported by Cutright; see Table 2. As pointed out

TABLE 2. MATRIX OF CORRELATIONS OF NEUBAUER'S MEASURES OF DEMOCRATIC PERFORMANCE, AND LEVELS OF EDUCATION, COMMUNICATION, AND URBANIZATION

	1	2	3	4
1) Communication		.314	.732	.424
2) Urbanization			.578	-.008
3) Education				.016
4) Democratic Performance				

Data taken from Neubauer, *op. cit.*, p. 577.

Figures for levels of agricultural employment are omitted.

mocracy is derived from the definitions of democracy put forward by Downs and Dahl. See Anthony Downs, *An Economic Theory of Democracy* (New York: Harper and Row, 1957), pp. 23-24; and Robert A. Dahl, *A Preface to Democratic Theory* (Chicago Press, 1956), p. 84.

by the author the latter correlation is very likely inflated since a measure of information equality (i.e., variability of communication sources) is included in the political democracy index. Thus Neubauer's findings introduce a note of uncertainty into an apparently well established social theory.

II. DATA

It appears that for at least two reasons more research is needed on political development and its correlates. First, Neubauer's research opens some question whether there is any association at all between political development and certain socio-economic variables. Second, for purposes of making causal inferences about political development, the data which have been used in previous studies contain certain limitations that have not necessarily been made explicit. Specifically, one characteristic of these studies is that they have all employed data on political development gathered over a large number of nations in the last two decades. This data-gathering process is adequate for correlational analysis in which one compares a present state of development—on which nations can differ—with certain levels of communications, urbanization or education. However to use this data to support a causal model about political development, one must make an inference about a process which occurs over time from data gathered at one point in time. Would not this inference be better supported by data gathered in separate nations over the period of their development?

The logic of the political development model derived by Lerner is that as levels of urbanization, education and communications gradually increase over time, these produce corresponding increases in the level of political development. The causal modeling technique followed by McCrone and Cnudde cannot directly test for this, but rather can only infer it through comparing differing national levels of socio-economic variables and political development in the present. By comparing these same variables in separate nations with data gathered over time, one could determine if this gradual development did in fact occur, or if there are sharp discontinuities in the development process which might not be accounted for in the Lerner theory.

To test Lerner's theory over time, it was necessary to select nations which were already developed, and for which there were sufficient historical data on the variables under consideration. Four nations were originally chosen for analysis: Canada, Great Britain, France, and the United States. These nations all had high scores on Cutright's index, and were also included in Neubauer's index of 23 democratic

countries.¹⁵ Only in the United States were data regularly collected over a sufficiently long time span to permit a test of the model.

The index of political development used in the time study attempted to operationalize the definition of democracy given earlier. In practice this index adopted Cutright's basic scoring procedure.¹⁶ A score for democratic political development was assigned to the United States for each decade over the period 1790-1960 ($N = 18$). The score for each decade was derived by assigning two points for each of the previous ten years that the United States had a directly elected legislature in which the minority party had 30 per cent of the seats; or one point per year if the minority party had less than 30 per cent of the seats. The total sum receivable for the legislature in any decade was 20 points. Similarly one point per year was assigned for a directly elected chief executive, with 10 points being the maximum receivable per decade.

The above scoring procedure accounts for the *institutional* and *competitive* aspects of democracy, but provides no measure of electoral *participation*.¹⁷ Participation in elections, and, more important, the right to participate in elections, is unquestionably a fundamental aspect of democratic political development. In the history of the United States, democratic institutions were established relatively early in the period under consideration, but it can be argued that the franchise has not yet become effective for the whole population. Thus it was felt some measure of participation, and implicitly the right to par-

¹⁵ Canada, Great Britain and the United States received the top score of 66 on Cutright's index, while France received 59 points. On Neubauer's index Great Britain and France received the highest rankings with 236.3 and 231.4 points each. Canada and the United States were 15th and 16th with 196.8 and 190.9 points respectively.

¹⁶ Cutright's method was used rather than Neubauer's because it seemed most consistent with the definition of democracy provided here. Furthermore Cutright's index appeared more appropriate for differentiating between conditions of low and high democratic development. Finally Cutright's 30 per cent rule does in fact measure competition, which was one of the two major criteria of democratic performance in Neubauer's analysis.

¹⁷ Electoral participation was a feature of Neubauer's index, and has been incorporated in Cutright's later work. See Cutright's communication to the Editor, this Review, 62 (1968), 578-580. See also, Phillips Cutright and James A. Wiley "Modernization and Political Representation: 1927-1966," *Studies in Comparative International Development (Monograph Series)* 5 (1969-70).

ticipate, should be included in the development index.

Participation was accounted for by multiplying the political development score for each decade by a value of one (1.00) plus the percentage (averaged over the previous decade) of the total population who voted for the chief executive. This information was available beginning in 1824, at which time the proportion of the population voting was 3.8 per cent.¹⁸ For the four decades prior to 1824, the figure of 3 per cent was arbitrarily selected. The actual percentage for these decades was very likely less than the 1824 figure, and was obviously greater than zero—hence the figure of 3 per cent was chosen as the likeliest estimate. In any case it is quite improbable that an error here could significantly bias the overall results of this study. The index derived from the above procedures is shown in Table 3.

In deriving the multiplier for electoral partici-

Decade	Legisla- tive Score	Execu- tive Score*	Participa- tion Multiplier	Political Develop- ment Score
1781-1790	10	4.0	1.030	14.4
1791-1800	20	3.5	1.030	24.2
1801-1810	14	6.2	1.030	20.8
1811-1820	15	5.6	1.030	21.2
1821-1830	15	8.0	1.075	24.7
1831-1840	20	9.6	1.128	33.4
1841-1850	20	9.6	1.158	34.3
1851-1860	20	9.8	1.161	34.6
1861-1870	14	9.9	1.132**	27.1
1871-1880	20	9.9	1.173	35.1
1881-1890	18	10.0	1.189	33.3
1891-1900	20	10.0	1.188	35.6
1901-1910	20	10.0	1.167	35.0
1911-1920	20	10.0	1.197	35.9
1921-1930	20	10.0	1.280	38.4
1931-1940	14	10.0	1.351	32.4
1941-1950	20	10.0	1.340	40.2
1951-1960	20	10.0	1.380	41.4

* Fractional points were assigned on the basis of the percentage of states which chose the chief executive in a direct election over the whole decade. See *Historical Statistics of the United States* (complete citation in footnote 20). Series Y 1-26 "Methods of Electing Presidential Electors: 1788-1936", pp. 679, 681.

** This figure is likely biased downward since the voting total in 1864 did not include the Confederate states.

Data for this table were taken from Robert E. Lane, *op. cit.*, p. 19; World Almanac, 1968; and *Historical Statistics of the United States*. The raw scores for political development were T scored to be consistent with the procedures followed with other variables.

¹⁸ This information is presented in tabular form in Robert E. Lane, *Political Life* (New York: The Free Press, 1959), p. 19

pation, a theoretical question arose as to whether one should measure actual participation as evidenced by the percentage of the population voting, or measure the right to participate as indicated by the percentage of the population legally enfranchised. Measuring the right to participate would directly reflect the extent of the suffrage, which surely is an indicator of the democraticness of the system. Measuring actual participation, while it also takes the right to vote into account, tends to be biased by voter interest which can change without regard for the right to vote. It is a contentious normative issue whether actual participation apart from the right to participate is an indicator of a democratic polity. This question aside however, data concerning the percentage of the population actually voting are perhaps a more meaningful measure of the *effective* extension of suffrage than are data on the percentage of persons legally enfranchised. On this point Robert Lane notes that the major increases in voter participation in the United States followed periods when voting restrictions were removed (e.g., property and sex restrictions). Conversely, the enfranchisement of former slaves during the Civil War produced little change in the voting behavior of these individuals, a fact generally corroborated by the findings of historians and by the small change in total participation figures immediately following the 1860's.¹⁹

Data were gathered on the socio-economic variables (urbanization, education and communications) in a manner consistent with the Cutright study wherever possible, although data limitations necessitated some alteration on the communications index. Urbanization was measured by the percentage of the population in cities over 50,000. This information was available without omission from 1790.²⁰ Education was a combined variable and was made up of the summed T scores of the percentage of the population literate and the number of persons enrolled in institutions of higher learning per 1,000 population. Data on this variable were gathered only since 1840, as there appears to be no official record either of literacy rates or university enrollments prior to that date.²¹ Figures on enroll-

¹⁹ *Ibid.*, pp. 16-22.

²⁰ Urbanization data were taken from U.S. Bureau of the Census, *Historical Statistics of the United States: Colonial Times to 1957* (Washington: Government Printing Office, 1960).

²¹ Literacy rates and enrollment figures since 1870 were taken from *ibid.* Data on enrollments for the period 1840-1860 were taken from U.S. Bureau of the Census, *Report on Education in the United States*, Eleventh Census, 1890.

ments can be estimated to 1790 by multiplying the number of institutions in existence per decade (for which data are available) times the estimated average enrollment per institution over this period. However these data cannot be used in the combined education index without corresponding data on literacy rates, and a thorough search provided no reliable method of estimating such rates prior to 1840. Consequently correlations between education and other variables are derived over the period 1840-1960.

The communications index was constructed from the summed T scores of the five following indicators: post office expenditures per capita; total number of newspapers and periodicals per capita; and telephones, radios, and television sets per capita.²² Data on postal expenditures and newspapers and periodicals were available from 1790. For the latter indicator it was necessary to interpolate to derive figures by even decades. The raw figures that were used for total newspapers and periodicals by decade are shown in Table 4. Data on telephones, radios and television sets were available in each case from the date they were invented and first used by the public. In order not to bias the scoring procedure, raw scores of zero were assigned for each indicator for each decade prior to its invention and dissemination (e.g., prior to 1940 in the case of television sets).

III. FINDINGS

The theoretical test which was performed on the U.S. time-series data can be divided into two

TABLE 4. TOTAL NEWSPAPERS AND PERIODICALS 1790-1960

Decade	Number	Decade	Number
1790	103	1880	11,314
1800	150	1890	17,710
1810	359	1900	24,486
1820	679	1910	28,556
1830	1000	1920	16,346
1840	1403	1930	14,760
1850	2794	1940	14,250
1860	4257	1950	13,845
1870	6314	1960	12,867

Data taken from U.S. Bureau of the Census, *A Century of Population Growth in the United States: 1790-1900* (Washington: Government Printing Office, 1909), p. 32; and *Historical Statistics of the United States*, p. 500.

²² Data on communications were taken from *Historical Statistics of the United States*.

parts. First is the question whether there is any relationship between urbanization, education, communications and political development. For the causal links of Lerner's theory to be maintained, there must be positive and significant correlations between the dependent variable and the various independent variables. The correlations for this study are shown in Table 5 and accompanying Figure 2.

TABLE 5. MATRIX OF CORRELATIONS OF U.S. MEASURES OF POLITICAL DEVELOPMENT, AND LEVELS OF EDUCATION, COMMUNICATION AND URBANIZATION

	1	2	3	4
1) Communication		.913	.871	.723
2) Urbanization	.001		.975	.711
3) Education	.001	.001		.682
4) Political Development	.001	.001	.05	

Numbers below the diagonal indicate the level at which the corresponding correlation would be statistically significant. For intercorrelations with education. $N = 13$.

FIGURE 2.

The data presented in Table 5 show that there is a strong relationship between the four variables, a finding similar to Cutright's conclusions. What is interesting is the similarity between Cutright's correlations and ours. On each of the three correlations with political development, and on the correlation between education and communications, the difference from Cutright's coefficients is less than 0.1. The remaining two correlations with urbanization (UE and UC) are higher for the U.S. data, a fact which suggests that the hypothesized close interrelationship between these socio-economic variables

in the process of development is revealed more clearly in time-series rather than cross-national data.²³ Finally the internal structure of the correlations is comparable between the two studies. Cutright showed the variable most strongly related to political development was communications, with urbanization and education following in order. Data on the United States indicate the same. Similarly the correlation between education and communications was higher than the three correlations with political development in both studies. Only the two correlations with urbanization (UE and UC) reflect any appreciable difference.

The second theoretical question involved the time ordering of the variables. To uphold Lerner's theory, it must be demonstrated that variables he posits as independent precede in time the dependent variable or variables. While conceptually simple, this test is very difficult to apply in the real world, especially when dealing with a complicated social phenomenon for which there is no clearcut beginning or end. In the cross-national data gathered by Cutright there is no way to test for the temporal ordering of the independent and dependent variables. In time-series data, one can approximate a test by introducing time lags into the correlations.

With data collected over time, one variable can be lagged behind another by correlating the score of the independent variable in time t (e.g. 1790) with the score of the dependent variable in time $t + 1$ (e.g. 1800); and so forth throughout all time periods. If there is a causal relationship between these variables such that an increase or decrease in the independent variable would produce a corresponding change in the dependent variable, this relationship should be reflected in an increasing correlation. Conversely, if the causal relationship as posited is valid, lagging the independent variable behind the dependent variable could be expected to reduce the correlation between these variables. Thus in a multivariate causal model, there are a number of independent tests that can be made for the validity of the model, depending on the number of causal links posited and the number of time lags introduced in either direction.²⁴

²³ With regard to this close interrelationship, Schnore finds a unidimensional structure emerging from a factor analysis performed on 12 national measures of modernization. Among the variables loading heavily on the single factor were newspaper circulation (.94), literacy (.89) and urbanization (.86). See Leo F. Schnore, "The Statistical Measurement of Urbanization and Economic Development," *Land Economics*, 37 (1961), 229-245.

²⁴ For further discussion of this method, as well

In the present study, the fact that historical data were available only at ten-year intervals limited the time-lag procedures. Both the established theory on development, and the high correlations achieved here, suggest that the variables in the development syndrome are tightly interconnected—that is, changes tend to occur simultaneously in these variables. If this is the case, one would not expect the time lags in the U.S. data to be very large between an independent and dependent variable. For this reason it would have been useful to have data for periods shorter than even decades, such as five-year intervals. In the analysis here, time lags will be limited to one and two decades in either direction; see Table 6.

The data in Table 6 generally confirm the Lerner theory, but with some reservations. The most striking confirmation is seen in the correlations of political development with education and communications. Lerner held that the independent variable most closely linked with political development was communications, a finding upheld by subsequent studies. This same finding occurs here, as the correlation between development and communications clearly increases as development is lagged, and decreases when communications are lagged. The same result appears generally for the correlation between development and education, although an expected increase in this correlation occurs only after development has been lagged by two decades. It is especially unfortunate that shorter time periods were not possible, since they would provide more correlation coefficients and hence facilitate a more careful assessment of the causal relationship between political development and educa-

as limiting assumptions, see D. Pelz and F. Andrews, "Causal Priorities in Panel Study Data," *American Sociological Review*, 29 (1964), 836-848.

One difficulty with time lag correlation analysis suggested by these authors occurs when variables are highly autocorrelated. By their argument, if lagged self-correlations approach unity, then all lagged inter-correlations approach the same value, thus preventing any causal inference. In this study, autocorrelation was assessed over the two time periods used, and the following coefficients were obtained: DD .698, CC .832, EE .988, UU .524. For at least two variables, autocorrelation was not extreme. One would expect the high autocorrelation for education to restrict analysis on this variable, although this obviously did not prevent the predicted change from occurring in the relationship between education and political development (see Table 6).

TABLE 6. TIME-LAG CORRELATIONS BETWEEN URBANIZATION, EDUCATION, COMMUNICATION AND POLITICAL DEVELOPMENT IN THE UNITED STATES 1790-1960

Variables	t=0	t=+10	t=+20	Variable Lagged	Lerner Prediction
CD	.723	.765	.780	Dependent	Increase
CD	.723	.670	.554	Independent	Decrease
ED*	.682	.647	.723	Dependent	Increase
ED	.682	.575	.581	Independent	Decrease
UD*	.711	.686	.682	Dependent	Increase
UD	.711	.688	.584	Independent	Decrease
EC	.871	.893	.871	Dependent	Increase
EC	.871	.910	.921	Independent	Decrease
UE	.975	.976	.971	Dependent	Increase
UE	.975	.979	.961	Independent	Decrease
UC*	.913	.849	.835	Dependent	Increase
UC	.913	.953	.940	Independent	Decrease

* No direct causal link is posited in Lerner's theory or in the McCrone and Cnudde analysis for the relationships between these variables. However since the theory holds that these variables are related in a developmental sequence, a likely result would be some rise in the correlations as the variable occurring later in the sequence is lagged.

tion. There is an element of randomness in the correlation coefficients produced by any time lag, since each lag reduces the N of the correlation. This is an especially difficult problem when dealing with a low N, since the results can be more easily biased by changes in the data. What was done here is to determine whether the two successive time lags, taken together, confirmed or disconfirmed the hypothesized relationship. The time-lag correlations of political development and education tend to confirm that education is one causal determinant of development.

The relationship between urbanization and development appears less clearcut from time lag analysis than it was from causal modeling procedures. Lagging the hypothesized independent variable does produce a falling correlation as predicted, but there is no increase—rather a decrease—in the correlation when the dependent variable is lagged. Admittedly the decrease is not great, and it remains stable over two lags. One possible explanation is that the effect of urbanization is filtered through other intervening variables, and thus changes in urbanization are not sufficiently closely related to changes in development over time to result in increased correlations when time-lags are introduced.

The time lag correlations of urbanization with education and communications suggest some deviation from the Lerner theory. The correlation

for urbanization and education does not react generally the way the theory would predict. However because of the near-perfect linear relationship between these two variables, and the fact that the most substantial change (.961) does occur in the predicted direction, the hypothesized causal relationship between urbanization and education cannot be rejected. However, for urbanization and communications, the opposite is true. The U.S. data unequivocally suggest that the causal path between these variables is from communications to urbanization. This contradicts Lerner and others who posited a developmental sequence from urbanization to education to communications.²⁵

Finally, the relationship between education and communications appears indeterminate in the U.S. data. Time-lag procedures do not identify a clearcut temporal ordering between these variables, although it would appear the case is strongest for identifying education as the dependent variable. What is very likely the case, and the same is true for urbanization and education, is that the relationship between these two variables is one of reciprocal causality, where changes in one variable produce changes in the second which then affect the first. The possibility of interaction between variables, which was mentioned by Lerner in the passage quoted earlier, was omitted by assumption in the McCrone and Cnudde analysis, but it is more likely to be the rule rather than the exception when dealing with complex social processes.²⁶

IV. CONCLUSION

The findings presented here show that for the United States the Lerner theory is with some modifications essentially accurate in its analysis of political development. Obviously these findings would be more valid were the test performed over more than one nation, but data limitations prevented this. On the other hand, over the period considered the United States was indeed a developing nation, and on some indicators such as participation and direct election of the executive it progressed from relatively low to relatively high development. If the theory

²⁵ It should be noted that the variation in the U.S. data may be accounted for by explicit qualifications in the Lerner theory. For example, Lerner suggested that the degree of urbanization affected the relationship between urbanization, literacy rates and media growth. Lerner, *op. cit.*, p. 63.

²⁶ For a discussion of the limitations of the causal modeling methods applied by McCrone and Cnudde, see Hugh Donald Forbes and Edward R. Tufte, "A Note of Caution in Causal Modelling," this REVIEW, 62 (1968), 1258-1264.

FIGURE 3

were valid, one would *prima facie* expect it to be valid in the United States.

The U.S. findings also tend to uphold the Cutright analysis, which suggests that differences between low and high political development (as measured by Cutright's index) are correlated with certain socio-economic variables. With relatively minor changes to allow for participation, Cutright's index was used for the United States, and similar correlations with socio-economic variables were obtained. Neubauer may have a point that once a certain level of democratic political development is achieved that socio-economic variables are no longer related to political development, but this does not overthrow Cutright's argument that there is a relationship in the earlier stages of development.

Some alteration to the causal links established in Lerner's theory are perhaps indicated by the U.S. study; see Figure 3. The essential links from education and communications to development are maintained by the time study. Also the developmental sequence from urbanization to education to development appears to be upheld. However the findings open the possibility of a

reciprocal causal relationship between urbanization and education. This appears to be a reasonable conclusion, since it is probable in U.S. development—and perhaps in development elsewhere—that rural education developed skills and expectations in the population that led people to migrate to urban areas.

The most important revision suggested by the U.S. data is the causal ordering between communications and urbanization. These variables are strongly related but it seems that the independent variable in the relationship is communication, and not urbanization. If so, this makes communication a more isolated variable in the development syndrome than was suggested either by Lerner or by the McCrone and Cnudde study. The question of explaining the causal relationship from communications to urbanization seems somewhat difficult, since Lerner's argument that industrial and urban development enables a society to develop its communications media seems plausible enough. On the other hand, as Lerner himself suggested, communications could have been an agent in the urbanization of society through the process of providing information to rural populations about new opportunities and a new way of life. It is very likely that both the early press in America, as well as personal communications, served this function. Finally, after the development of telephones and radios this function could have been served without the requisite need for literacy, and hence could have operated without further increases in the levels of education. This is an important fact to consider in "developing" nations today, since verbal and visual communications bulk much larger in the total communications process now than they did in the history of the United States.

SUPPORT FOR THE INSTITUTION OF ELECTIONS BY THE MASS PUBLIC*

JACK DENNIS

University of Wisconsin

The institution of elections is a significant feature of most present day political systems and is one of the most widely used of all of the political inventions of mankind. Rose and Mossawir have recently remarked that, "Elections are among the most ubiquitous of contemporary political institutions, and voting is the single act of political participation undertaken by a majority of adults in a majority of the nations in the world today."¹ The importance of elections is especially high in democratic systems. Both earlier and more contemporary discussions of the concept of democracy have employed elections as a primary definiendum and requisite feature of democracy.² Indeed, if any single institution serves as popular democracy's *sine qua non*, it is that of elections.³

The general argument that elections are

"those most essential events in the democratic process"⁴ is often posed from the perspective of the importance of the functions they perform in the political system. The most widely remarked of these functions is to provide a mechanism by which the great mass of members of the system are able to choose their leaders—thus giving majority approval to the exercise of leadership.⁵ This is important both from the standpoint of solving the problem of legitimate leadership succession and as a means of potential relief from abuses or inadequacies of a present set of rulers.⁶ Secondly, elections may serve as an indication of public choice among government policies—although this function is probably less frequently performed than once was thought to be the case. In referenda, the function is direct; but even in the elections of candidates for public office there is on occasion a question of public decision among the broader aspects of policy programs.⁷ Furthermore, belief by future candidates in the possibility that voters may reject them at the next election because of their policies may lead

²See, for example, Giovanni Sartori, *Democratic Theory* (New York: Praeger, 1965), p. 73; W. J. M. Mackenzie, *Free Elections* (London: George Allen & Unwin, 1958), p. 11; Harry Eckstein, *Division and Cohesion in Democracy: A Study of Norway* (Princeton, N.J.: Princeton University Press, 1966), p. 229; Graeme C. Moodie, *The Government of Great Britain* (London: Methuen, 1964), p. 188; and Seymour Martin Lipset, "Some Social Requisites for Democracy: Economic Development and Political Legitimacy," this *REVIEW*, 53 (1959), 69-105.

³This is not to say that elections are sufficient for the maintenance of popular democracy. The many totalitarian regimes where elections are held without free choice belies that judgment. One may suggest, however, that they are necessary to the existence of what is commonly understood by the concept in majoritarian, populist and participant senses.

⁴D. E. Butler, *Elections Abroad* (London: Macmillan, 1959), p. 9.

⁵Discussion of this and other system functions of elections is found in Rose and Mossawir, *op. cit.*, and in Gerald M. Pomper, *Elections in America* (New York: Dodd, Mead, 1968).

⁶Protection of the people as a central role of elections was put forcefully by James Madison: "As it is essential that the government in general should have a common interest with the people, so it is particularly essential that the [legislature] should have an immediate dependence on, and intimate sympathy with, the people. Frequent elections are unquestionably the only policy by which the dependence and sympathy can be effectually secured": *The Federalist*, No. 52, p. 343; quoted in Gerald Pomper, "The Concept of Elections in Political Theory," *The Review of Politics*, 29 (1967), 478-491, at p. 480.

⁷We do not need to go so far as to endorse the idea of "electoral mandates" to observe that in some elections policy issues may be of importance for the outcome. See, for example, Leon D. Epstein, "Electoral Decision and Policy Mandate: An Empirical Example," *Public Opinion Quarterly*, 28 (1964), 564-572.

them to anticipate public feeling, thus allowing indirect influence of elections upon policy formation. The latter may operate even in the absence of more direct control by the electorate.⁸ A third central function of elections is legitimization of a regime. An election serves as a device of public endorsement—or occasionally, of repudiation—of the system of government. This pertains even in the many nations where leadership choice and policy influence aspects of elections have atrophied.⁹ Thus, whether or not an election fulfills other purposes, it may allow the voter to reaffirm his faith in the validity and legitimacy of the political order.¹⁰ Elections therefore link the citizen to his government by involving him in important political choices of leadership and policy and in evoking his attitude toward the wider institutional pattern under which elections are provided.¹¹

I. ELECTIONS IN AMERICA

Given such major consequences for the political system—particularly for the democratic system—it would not be surprising to find that elections have become well established in American political practice. There is much that supports such a conclusion. Unlike political parties, elections were given original constitutional status; and the basic principles of the current system of elections date from very early in the life

of the nation.¹² Not only have elections existed from the beginning of the republic, but they have penetrated all levels of government and a wide range of offices—from President of the United States to member of the local school board. This has meant very frequent elections and opportunities for voter participation. As Lane has observed, “. . . over a four year period, there are probably more votes per capita cast in the United States than in any other country. . . .”¹³ By the criteria of constancy of operation and unchallenged constitutional status, frequency of opportunity for participation, and pervasiveness among types and levels of offices, elections may be regarded as a well-founded, ultra-stable feature of the American political landscape.

What this conclusion leaves out of account, however, is that, like all other institutions of political society, elections are subject to what Huntington has termed “political development and political decay.”¹⁴ The experience of the wider world beyond the American system suggests that neither democratic regimes nor their chief institutions should be taken as givens. As Mackenzie has noted: “The world is strewn with the wreckage of electoral systems.”¹⁵ Indeed, only a minority of countries today have free and frequent elections based on mass suffrage. “Only about a quarter of the nations of the world hold elections in which the adult population chooses among competing candidates.”¹⁶ Even in those nations that have free elections, the scope of the electoral process may be severely limited by those in power or distorted through gerrymandering, malapportionment, suffrage restrictions and the like. Electoral systems often favor those already in power and nearly always favor, for example, stronger over

⁸ See, for example, the discussion of the way this “law of anticipated reactions” operates in elections for the U.S. House of Representatives by Warren E. Miller and Donald E. Stokes in “Constituency Influence in Congress,” in Angus Campbell, Philip E. Converse, Warren E. Miller and Donald E. Stokes, *Elections and the Political Order* (New York: Wiley, 1966), pp. 351-372.

⁹ The legitimization function is especially prominent in the elections of Communist nations. See, for example, Z. Pelczynski, “Poland, 1957,” in Butler, *op. cit.*, pp. 119-179, at p. 119, where he says that once power has been consolidated, the election’s function “is to legitimise the revolution and to secure for the regime a stamp of popular approval.” Also see Jerzy J. Wiatr, “Elections and Voting Behavior in Poland,” in Austin Ranney (ed.), *Essays on the Behavioral Study of Politics* (Urbana, Ill.: University of Illinois Press, 1962), pp. 235-251; and Howard R. Swearer, “The Functions of Soviet Local Elections,” *Midwest Journal of Political Science*, 5 (1961), 129-149.

¹¹ See V. O. Key, Jr., *Public Opinion and American Democracy* (New York: Knopf, 1961) for detailing of this linkage—especially pp. 458-480.

¹² DeTocqueville traces some of these developments to the turn of the nineteenth century. He observes, for example, “The state of Maryland, which had been founded by great lords, was the first to proclaim universal suffrage in [1801 and 1809] and introduced the most democratic procedures throughout its government.” *Democracy in America* (New York: Harper, 1966), Vol. I, p. 70.

weaker political parties.¹⁷ There are indeed so many types of departures from the norms of free and universally participant elections that one needs a complex set of categories to describe them.

We thus observe the possibility of variance in the persistence of the institution: external variance in that some systems, offices and matters of policy decision employ elections—more or less frequently—while others do not; and internal variance in the extent to which elections are permitted to operate freely and without distortion within a given system and category of political choice. The purpose of the present investigation is to begin to test this variance: to see how firmly the electoral institution is rooted in American public consciousness, and thus to illuminate its prospects for withstanding future stress. Radical critics of American political institutions have recently called American elections into question as a device of democratic government. The question then is, do elections enjoy sufficient public confidence to be maintained into the indefinite future, even in periods of high stress?

Let us begin this assessment by asking how do elections fare in general on the balance sheet of institutional change? In these terms, there is evidence in the United States to suggest development, failure to develop, and decay. On the side of development, there is a record of progressive removal of suffrage restrictions based on such criteria as property, sex and race. There has been also a vigorous, recent movement to reduce malapportionment among legislative districts and other constituencies on the "one man—one vote" principle. In addition, we are seeing currently new pressures to reform the financing of campaigns, to eliminate the Electoral College, and to lower the voting age uniformly to eighteen.¹⁸ All of these changes, if effected, would

generally be regarded as developmental in character, in that they serve to perfect, extend and enhance the political significance of the institution.

Balancing these developmental tendencies, however, are some instances of institutional decay. Pomper observes, for example, that the introduction of the "short ballot," the growth of appointment and merit systems for chief executives such as city managers, the lengthening of tenure of elected officials and declining public trust in the devices of direct democracy such as the initiative, the recall and the referendum, are all instances of electoral-institution decay in America.¹⁹ Thirdly, on the side of retardation of the institution's development, one still observes continuing restrictions on suffrage based on registration to vote, length of residence in the constituency, and age. More generally, it is well known that the diffusion of power through the federal system, separation of powers among the branches of state and federal government, and encouragement of the principle of minority rights to access—manifested especially in the free operation of political interest groups—often upset whatever influence the majority might have had through elections. The forecasts of observers such as De Tocqueville, who believed that elections would lead to unfettered majority rule, are, by American practice, therefore contravened.²⁰ Furthermore, as Lane points out, "The Constitution, and the American system of government generally, serve in certain respects, to discourage the electorate from voting. This is not by accident; it is by design of the framers who feared factions and uninhibited majority rule."²¹

whereas only 37% preferred an electoral vote: Hadley Cantril and Mildred Strunk, *Public Opinion 1935-46* (Princeton, N.J.: Princeton University Press, 1951), p. 189. In a 1967 Gallup Poll, 65% of a national sample said they would approve of an amendment to the constitution which would do away with the Electoral College and base the election of a President on the total vote cast throughout the nation. Only 22% disapproved of such an amendment: Gallup Poll Report, *The Capital Times* (Madison, Wisconsin, No. 27, 1967), p. 11. By November, 1968, approval of the latter amendment had risen to 81%: *Gallup Opinion Index*, Report No. 52, October, 1969, p. 22.

¹⁹ *Op. cit.*, p. 7

²¹ Lane, *op. cit.*, p. 317.

¹⁷ See Douglas Rae, *The Political Consequences of Electoral Laws* (New Haven, Conn.: Yale University Press, 1967), p. 134.

¹⁸ On reform of campaign financing, see, for example, Alexander Heard, *The Costs of Democracy* (Chapel Hill, N.C.: University of North Carolina Press, 1960). Electoral College reform has been proposed anew in the aftermath of the 1968 election. One must bear in mind in classifying this as an area of possible development, however, just how resistant to change this part of the system of elections has been—in spite of wide public support for reform for over 30 years. For example, in answer to a Gallup Poll question, "Do you think the president should be elected by popular vote or by electoral vote as at present?," 63% of a national sample in June, 1936, preferred a popular vote

Because of such voter discouragement, one might suspect that the system of elections in the United States would be subject to long-term decay on the level of voter participation. The evidence is somewhat mixed and scholarship is therefore not unanimous on this question. Although voter turnout in elections as a proportion of the population has risen with the easing of suffrage restrictions, Burnham's data suggest that the percent of eligible electors who avail themselves of the privilege is lower than it once was, in comparison with voting levels in the nineteenth century.²² On the other hand, other data, covering 1920-1964, show a distinct upturn in turnout.²³ In an important sense, therefore, the mass public may have withdrawn some of its support from the institution of elections over the long term, but at this point we are uncertain about the overall trends.

This leads directly to the main question of the research to be reported below. If there has been a drop in voting by eligible electors, does this indicate some loss of public confidence in the institution of elections? Do the recent criticisms of the American electoral process by militant students, blacks, and others simply give voice to an erosion of favorable public sentiment that has been in evidence for many years?²⁴ To begin

²² *Ibid.*, pp. 16-26; and Walter Dean Burnham, "The Changing Shape of the American Political Universe," this REVIEW, 59 (1965), 7-28. There is some disagreement about how contemporary turnout levels in the United States compare with other Western democracies. The Report of the President's Commission on Registration and Voting Participation (Washington, D.C.: U.S. Government Printing Office, 1963) observes, for example, that, "Even with adjusted figures, the plain fact remains that citizens of other democracies vote in greater relative numbers than Americans. The United States, leader of the free world, lags behind many other free countries in voter participation." [page 8]. By contrast, William G. Andrews concludes on the basis of his calculations that, "This means that about 83.2 percent of the eligible, able electorate voted in 1960—a figure nearly 20 percent higher than the one generally used to indicate voting participation in the United States. One can reasonably conclude that between 80 and 85 percent of the American electorate voted in 1960": "American Voting Participation," *The Western Political Quarterly*, 19 (1966), 639-652, at p. 651.

²³ William H. Flanagan, *Political Behavior of the American Electorate* (Boston: Allyn and Bacon, 1968), pp. 16-19.

²⁴ The kind of observation one meets increasingly in the press and elsewhere is exemplified by this statement on the demonstrations in Chicago at the

to answer these queries is the purpose of the present analysis. Before we can proceed, however, we will first need to indicate briefly some categories of appropriate evidence for testing public confidence in the institution of elections.

II. MEASURING SUPPORT FOR THE SYSTEM OF ELECTIONS

While the extent to which those allowed to vote avail themselves of the opportunity to do so is a possible indicator of the mass public's confidence in elections, it is a not wholly satisfactory one. As the literature on voting has shown, potential electors may participate out of a sense of partisan loyalty, ideological preference, attraction to particular candidates, reaction to immediate social pressure, feelings of contentment or discontent with general socioeconomic conditions, etc. Elections, as noted above, are primary vehicles of mass political choice behavior and manifestation of partisanship; and voting may also be a response denoting approval of the regime at a more general level. Thus, the intention if not the effect of turnout is only in part an expression of approval of the institution of elections *per se*.²⁵ What is needed therefore is a more direct measure of public feeling about the institution of elections as such.

To measure public sentiment regarding the system of elections, we focus in particular upon what in previous studies of this kind has been referred to as *diffuse support*.²⁶ Diffuse support

time of the 1968 Democratic Party Convention: "The protesters never seriously sought to influence events inside the International Amphitheatre. From the start most of them regarded the Democratic Convention as rigged and the entire electoral process as bankrupt": F. Richard Ciccone, "Anatomy of Protest: Daley vs. New Left," *The Milwaukee Journal*, Part I, September 1, 1968, pp. 1 and 4, at p. 4.

²⁵ Equally, non-voting, abstention, boycotting, elections, voiding ballots, and the like are all imperfect indicators of feeling about the electoral process in that they may as often result from political apathy, disapproval of the regime, disgust with the present party system, the candidates or the issues at hand, than from disaffection from the electoral process.

²⁶ The concept of diffuse support has been proposed and explicated theoretically by David Easton. See, for example, his *A Systems Analysis of Political Life* (New York: Wiley, 1965). Empirical applications of the concept include: Jack Dennis, "Support for the Party System by the Mass Public," this REVIEW, 60 (1966), 600-615; David

is an orientation of good will toward an object which does not depend upon specific benefits derived from the object—in this case, the institution of elections. Because a diffusely supported institution of elections would be valued for its own sake, the effects of displeasure with a particular electoral outcome upon diffuse support would be marginal. Of course, repeated failure of the institution to provide acceptable outcomes is one of the conditions that undermines diffuse support and, in the long run, weakens the institution itself. The data to be presented below result from an initial inquiry into contemporary levels of diffuse support for the institution of elections in the United States.

The Data

In an earlier report dealing with levels of public support for the institution of political parties, a number of interview questions were posed to a sample of Wisconsin adults in 1964.²⁷ Responses to these items were then factor-analyzed to determine the basic attitudinal dimensions which they gauged. In the present investigation, a similar approach is used to measure support for the electoral system, using initially a series of agree-disagree items from a 1966, area-cluster probability survey of Wisconsin adults. Thus, one of the major purposes of this survey is to provide the basis for devising a measure of support for elections similar to that constructed earlier to determine levels of collective support for the party system.

Using such a measure, one is able not only to determine the present levels of support for the institution but also to categorize and compare available collateral data, and thus to see how public support has varied over time and across political cultures. In what follows therefore the steps will be: (1) to test the extent to which there is an empirically definable orientation of diffuse support toward elections which is discriminable from diffuse support for the party

system; (2) to present and interpret levels of public support for elections on such a measure or measures; (3) to compare the Wisconsin findings with other relevant data; (4) to investigate the relation of support for elections to other variables, demographic and political.

An Hypothesized Dimension of Support

In order to construct a measure of support for elections that would be meaningful both to the general public and for the theoretical purposes of political science, items of several types were included in the survey. Broadly, these items have to do either with the judgment of the worth of the institution in its own right or with relative approval of the present operation of the electoral process. Let us view each of these in more detail.

One of the most general regime norms of democracy, derived from a belief in consent of the governed, majority rule, and free competition for public office, is that elections are a worthwhile institution of popular participation and that individual members ought therefore to vote. The duty to vote is of special, indeed of paramount, interest in this connection. The expectation that the citizen of a democracy will vote in popular elections is a crucial norm because it links his own behavior directly to the institution. Such an expectation and its corresponding role-behavior has significance in that it gives symbolic expression to the more general principles that undergird the role, for example belief in the necessity for majority rule.²⁸ Such an expectation applies, therefore, even when the choice aspects of voting are perceived by the potential voter to be negligible. Internalization of the duty to vote, if not fully synonymous with raising the level of the individual's diffuse support for the institution, is nonetheless one of its necessary ingredients. The member becomes obliged by such a sense of duty to contribute his own resources of time and effort even when particular elections are anticipated to be unfavorable or trivial to his own interests.

But something else is involved. Not only should the member come to have sentiments about the worth of and necessity for participating in elections, but he should also become generally oriented to the way they operate. While he may not like what goes into or results from a particular election, he should, if diffusely sup-

Easton and Jack Dennis, "The Child's Acquisition of Regime Norms: Political Efficacy," this Review, 61 (1967), 25-38; G. R. Boynton, Samuel C. Patterson, and Ronald D. Hedlund, "The Structure of Public Support for Legislative Institutions," *Midwest Journal of Political Science*, 12 (1968), 163-180; Walter F. Murphy and Joseph Tanenhaus, "Public Opinion and the United States Supreme Court," *Law and Society Review*, 2 (1968), pp. 357-384; David Easton and Jack Dennis, *Children in the Political System: Origins of Political Legitimacy* (New York: McGraw-Hill 1969).

²⁷ Dennis, "Support for the Party System by the Mass Public," *loc. cit.*

²⁸ That majority rule is endorsed in general by the mass public at a nearly unanimous level is indicated in data found in James W. Prothro and Charles M. Grigg, "Fundamental Principles of Democracy: Bases of Agreement and Disagreement," *Journal of Politics*, 22 (1960), 276-294.

portive, be convinced that the overall results of elections are beneficial. On the input side, we ask whether he thinks the campaign process represents a worthwhile expenditure of social resources, for example. On the side of outputs and outcomes, does he regard elections as making a real difference in the way leadership is exercised and policy is directed, or does he perceive that it has only ritual, symbolic functions to perform?

To tap these various aspects of diffuse support for elections a series of agree-disagree items was employed. The hypothesis was that together these items would form an empirically-observable attitude dimension distinct from the orientation of diffuse support for the party system operationalized earlier. If there were such an empirically defined dimension, it would provide a basis for assessing the relative value of individual item indicators in measuring such an orientation; and thus, it would make possible meaningful comparisons with items from other surveys in order to give historical and comparative depth to the analysis.

III. FINDINGS

The Observed Support Dimensions

We find, upon principal component analysis of the matrix of correlations among nineteen items pertaining to the party and electoral systems (reproduced below in Table 1), that three election system components rather than one is the empirical result; and that these three components are distinguished in large part from the dimension of support for the party system.

Factor I defines an area of public feeling having to do with the felt obligation to participate in elections (items 4, 9, 16 and 17) and with the satisfaction that one obtains from discharging such an obligation (item 12). I will refer to this dimension simply as "voting duty"—which I take to be a primary indicator of diffuse support for elections as discussed above.

Factor II concerns broadly the member's reactions on the input side of the electoral process: his relative approval of resources expended in election campaigns (item 11), whether such campaigns are to be taken seriously (item 4), whether the principle of submitting leaders to the test of popular choice is worthwhile (item 19), and whether voters are able to perform their electoral role with competence (item 18). To a lesser degree, some of the items on political parties load on this component (items 6, 7, and 8), a slight overlap in public perception of the two institutions which makes excellent sense given the central role of parties in much electoral competition.

Factor III is support for the party system in that all of the highest loading items (1, 2, 5, 6,

and 7) are concerned with the parties; and none of the election system items is weighted above .27 on this dimension. Thus attitudes toward parties are clearly separable from those toward elections in the public mind. This empirical distinction will prove significant when we attempt in a preliminary way to compare below the relative magnitude of public support for the two institutions.

Factor IV concerns mainly the efficacy of elections in giving the people influence in "running the country" (items 3 and 10). It also involves to a lesser extent the idea of extending the principle of electoral competition for public offices (item 15). For sake of simplicity, this dimension will be called "efficacy of elections" in that its main emphasis is upon the belief that elections result in increasing popular influence on government.

Levels of Public Support for Elections

With these dimensions of support thus empirically defined, the discussion can proceed next to assessing the relative degrees of public support for the system of elections. We shall also want to interpret such levels of support or non-support in comparison with public feeling at earlier points in time, with mass opinion in other Western democracies, and with public regard for the party system.

1. *Voting Duty.* As we turn first to voting duty, we are fortunate in that earlier work in the field of voting behavior has revealed much of interest for present purposes. The work that originally gave clearest empirical expression of the sense of voting duty was *The Voter Decides*. Voting duty was there termed "a sense of civic obligation to vote" or, more simply, "sense of citizen duty."²⁰ The present terms of measurement draw heavily upon items from that original effort; and the data generated at that time, and in the subsequent national surveys of 1956 and 1960, will be used below to evaluate possible trends in the collective sense of voting duty in the American public. Before viewing these data, however, let us first consider a more general issue.

An impression that one is apt to gain from close acquaintance with American culture is that the duty to vote ranks high among all of the civic obligations recognized by Americans. Some evidence that supports this impression has been reported by Milbrath. A survey conducted among the general citizenry of Evanston, Illinois, in 1960, showed that 79% of the respon-

²⁰ Angus Campbell, Gerald Gurin and Warren Miller, *The Voter Decides* (Evanston, Ill.: Row, Peterson, 1954), pp. 86, 194-199.

TABLE 2. DISTRIBUTION OF RESPONSE TO VOTING DUTY ITEMS, WISCONSIN, 1966*

Items	Rotated Factor Weight	Percent							Total %
		Strongly Agree	Agree	Agree- Disagree	Disagree	Strongly Disagree	Don't Know	Not As- certained	
16. "So many other people vote in the national elections that it doesn't matter much to me whether I vote or not."	.77	1%	7	1	68	21	1	1	100%
9. "It isn't so important to vote when you know your party doesn't have a chance to win."	.71	1	4	2	68	23	1	1	100%
12. "I generally get a feeling of satisfaction from going to the polls to cast my ballot."	-.69	15	71	4	5	1	3	2	101%
4. "Many primary elections aren't important enough to vote in."	.52	2	17	7	58	14	2	1	101%
17. "A person should only vote in an election if he cares about how it is going to come out."	.52	2	27	3	51	14	2	1	100%

* Only items with factor weights $\geq .50$ are included. Some rows do not sum to 100% due to rounding error. N = 607.

dents agreed that one fulfills his civic duty if he votes regularly.³⁰ A similar consensus was discovered in data from a later survey in Buffalo, New York. From the latter study, Milbrath reports that:

Certain inputs are almost universally believed to be a citizen's responsibility: vote (93%), keep informed (80%), teach children good citizenship (87%), pay taxes (98%), have undivided loyalty to the country (93%). The percentage doing each of these things at least "fairly often" holds up quite well: vote (82%), keep informed (72%), teach children good citizenship (75%), pay taxes (93%), have undivided loyalty (93%).³¹

The extent of societal emphasis upon voting duty as a primary civic role is therefore high in America. Indeed, it is probably more highly ranked here than for many other democracies, even those generally regarded as having higher turnout rates than does the United States.³²

³⁰ Lester Milbrath, *Political Participation* (Chicago: Rand-McNally, 1965), p. 62.

³¹ "The Nature of Political Beliefs and the Relationship of the Individual to the Government," *American Behavioral Scientist*, 12 (1968), 28-36, at p. 33.

³² See Gabriel A. Almond and Sidney Verba, *The Civic Culture* (Princeton, N.J.: Princeton University Press, 1963), p. 171. Their five-nation data show

That voting duty should be so prominent among expected civic virtues suggests that powerful sources of social reinforcement are present to maintain it, especially political socialization. What Rose and Mossawir observe for Britain and other free societies can probably be applied strongly in America: "In Britain and other free societies, the duty to vote, through a process of

Americans to be especially high relative to Britons, Germans, Italians, and Mexicans in mentioning voting as a response to the question of what role the ordinary man ought to play in his local community. This is not to say that the sense of obligation to vote is not high in these other democracies. Rose and Mossawir found, for example, in their Stockport, England, sample that "82% replied that they thought voting a duty," when asked "whether you don't have to vote unless you feel like it, or whether voting is a duty." [*Op. cit.*, p. 189.]. Edinger presents data, moreover, which suggest that voting is at the top of the list of citizenship obligations felt by West Germans: Lewis J. Edinger, *Politics in Germany* (Boston: Little, Brown, 1968), p. 106. Furthermore, there is evidence to suggest that voting is apt to be conceived more as a duty than as a right (and perhaps not as an effective means to influence public policy therefore). Some older American data (1944), showed in answer to the question, "Do you regard voting more as a duty you owe your country, or more as a right

TABLE 3. TRENDS IN VOTING DUTY: COMPARISON DATA

(a) "So many other people vote in the national elections that it doesn't matter much to me whether I vote or not."

^a From the Codebooks of the 1952, 1956 and 1960 Election Studies of the University of Michigan Survey Research Center. These data were made available by the Inter-University Consortium for Political Research.

^b From a state-wide survey of Wisconsin adults in April and May, 1963, by the University of Wisconsin Survey Research Laboratory. The question in this instance was worded: "So many other people vote in presidential elections that it doesn't really matter whether or not I personally vote." Two other surveys conducted by U.W.S.R.L. in spring and fall, 1963, show the collective stability of this sentiment even under different item wording. In the spring, 1963 survey (March and April), 89% disagreed with the statement, "Why bother to vote when you can do so little with your one vote." In the fall, 1963 survey, 88% disagreed that, "So many other people vote in the national elections that it doesn't matter much to me whether I vote or not."

socialization, becomes a response to an internal compulsion."³³

The impression of general public adherence to the norm of voting duty is forcefully reaffirmed when we turn to the 1966 Wisconsin data. Table 2 presents the distribution in response to the five highest loading items on the voting duty dimension.

A very high public endorsement of the duty to vote appears on these items. Diffuse support for elections is on this level, very firmly based. And, when we take account of comparable data from earlier national surveys—where the same or very similar items were used—we reach the same conclusion. Table 3 shows these comparison data.

to use if you want to?", that 59% chose *duty* and 36% *right*: National Opinion Research Center national sample; data available from the Inter-University Consortium for Political Research. A quite similar distribution was found in a 1953 national survey in France. See Jean Stoetzel, "Voting Behavior in France," *British Journal of Sociology*, 6 (1955), 104-122, at p. 120.

³³ *Op. cit.*, p. 189.

On the first two items—where the wording is the same as in the present survey—we obtain nearly identical results for Wisconsin and the nation as a whole. The figures are remarkably close, suggesting that Wisconsin is not unrepresentative for items of this kind. On a third, comparable, but not identical item, we find a roughly equivalent level of public endorsement in Wisconsin and the United States as a whole (item c). Furthermore, looking at the national data from a time perspective, one observes that the trends on these three items though slight are up without exception.³⁴ When we put this small rise together with the fact that the American sense of duty to vote is relatively high, and probably higher than in many other comparable systems,³⁵ we can infer that a profound resource

³⁴ These trends were pointed out earlier, using the Michigan Survey Research Center election study data, by Robert E. Lane. See "The Politics of Consensus in an Age of Affluence," this REVIEW, 59 (1965), 874-895, at p. 894.

³⁵ Present day Americans are high in sense of duty to vote, not only in recent historical, but also comparative, contexts. For data on the latter, see Almond and Verba, *op. cit.*, pp. 145-146.

exists on which to base the future of the institution in America.

Before we conclude that the foundations are perfectly sound, however, we should also consider how the general public perceives the institution at the level of its operation, i.e., in terms of Factors II and IV as defined above.

2. Approval of the Electoral Process. Factor II, perception of the operation of elections on the side of electoral input, shows a rather more mixed state of public opinion than is the case for voting duty. Table 4 presents these data.

A majority of the 1966 respondents agree that resources are wasted in political campaigns relative to how such resources could otherwise be expended (item 11). Rather substantial minorities also agree with the other three, negatively pitched items. Only on the proposition that most election campaigns are silly or ridiculous is there a clear majority supportive of the electoral institution at this level.

Other available evidence would tend to support these findings. Data from the Almond-Verba five-nation study suggest a similarly mixed state of opinion in a series of questions on campaigns and voting. Their U.S. sample was highest of all five nations in agreeing that campaigning is needed (74% U.S., 63% U.K., 60% Mexico, 42% Germany, and 39% Italy) and in agreeing that election campaigns are "often" or "sometimes" pleasant and enjoyable (66% U.S., 52% U.K., 38% Germany, 34% Mexico, and 28% Italy). On the other hand, the U.S. sample was also highest in finding elections "often" and "sometimes" silly or ridiculous (58% U.S., 46% Germany, 37% U.K., 32% Mexico, and 19% Italy), and in "often" and "sometimes" getting angry at some of the things that go on in election campaigns (57% U.S., 46% Germany, 42% U.K., 26% Mexico, and 20% Italy).³⁶ Americans thus give a rather uneven reception to the campaigning aspects of the electoral process—more so than for any of the other four nations.

On the issue of public perception of its own members' electoral competence, there are also a number of suggestive earlier data. Prothro's and Grigg's evidence showed that less than a majority disagreed with the statement, "In a city referendum, only people who are well-informed about the problem being voted on should be allowed to vote."³⁷ McClosky's 1957-58 national sample revealed that only 48% agreed that "People ought to be allowed to vote even if they can't do so intelligently." In addition, 62% of

McClosky's general electorate agreed that "Issues and arguments are beyond the understanding of most voters"; and 48% agreed that, "Most people don't have enough sense to pick their own leaders wisely."³⁸ We find from these earlier studies therefore that a rather high proportion of people are critical of the ordinary man's electoral capacities. That there is a relatively low collective evaluation of voters is confirmed by the 1966 Wisconsin data. Less than a majority disagree that, "It is impossible for most voters to make informed and intelligent decisions when they go to the polls." (Table 4). The public is critical of itself, or more precisely, its members are as often critical of each other's capacities as they are willing to believe in the rationality of the common man.

Our conclusion at this point must therefore be that high support on the plane of civic obligation to vote is not matched by equally high approval of the campaigning and other aspects of the input side of the electoral process, particularly in according one's fellow man any substantial measure of voter intelligence. What then of electoral output?

3. The Efficacy of Elections. Factor IV defines an attitudinal orientation toward the operation of elections with regard to outputs. Are elections perceived as giving the mass public a chance to participate in government? Table 5 presents the pattern of response to the items loading highest on this dimension.

What we observe is a situation of support intermediate between those discussed above. There are clear majorities on each of these items supporting the operation of elections in government. But the level of public belief is considerably lower than for voting duty. While a majority of the public is confident that elections have participatory results, such belief is clearly not consensual.

The first (and best) item indicator on this dimension has also been used in national surveys (and this earlier use inspired its employment in the Wisconsin survey). We observe for the latter indicator some possibility of a decline in this variety of support since 1952. In the 1952 Michigan election study, 77% agreed that "The way people vote is the main thing that decides how

³⁶ *Ibid.*

³⁷ Prothro and Grigg, *op. cit.*, p. 285.

³⁸ Herbert McClosky, "Consensus and Ideology in American Politics," this REVIEW, 58 (1964), 361-382, at pp. 365 and 369. For comparative perspective, we might note that Rose and Mossawir's study in Stockport, England, similarly revealed a not high majority (57%) who judged that "most people do think about how they vote": *op. cit.*, p. 187.

things are run in this country."³⁹ In the Almond and Verba U.S. survey of 1959, however, such agreement was 71%, an ostensible drop in support.⁴⁰ We might note also, although the comparison is rather speculative, that only 57% agreed with this statement in the 1966 Wisconsin survey; but a substantial 18% availed them-

selves of the agree-disagree option. When the latter are partitioned proportionately into agree or disagree categories, agreement then rises to 70%, which is still below the 1952 national figure (unlike the items on voting duty reported in Table 2, where Wisconsin was as high or higher than the national figures).

The evidence at this point is incomplete, but I nevertheless draw the tentative inference that there has been a net decline in valuing elections for their participatory effects. This is contrary to the trend of valuing participation on the level

of voting duty. In comparative context, moreover, both Britain and Germany in the Five-Nation study scored higher than the U.S. on the level of support manifested by the first of these Factor IV items.⁴¹ Thus, belief in elections as an effective instrument of participatory democracy is apparently lower in America than the belief that one should vote—something which would tend to increase the ritual aspects of electoral behavior. The belief in electoral efficacy is also possibly lower than it was in 1952; and it suffers by comparison with some other Western democracies. This is an obvious area for further analysis, using a broader and perhaps more incisive range of questions than was possible in this very limited and preliminary analysis. Before we leave the question, however, there is one further comparison to make and that is with support for the allied institution of political parties.

Support for Elections versus Support for Parties

Popular and representative democracy has generally required that parties and elections should be interdependent. Once elections are allowed under the legal and structural terms of a regime, the stage is set for the creation of political parties to organize and contest elections. Without political parties, elections more often than not become emptied of meaning and the choice situation facing the voter becomes difficult and often uninterpretable.⁴² But parties and elections are not necessarily of equal status as institutions. However important might be the interrelationships between the two institutions, elections in America have probably been accorded greater legitimacy than have the parties,

⁴¹ *Ibid.* U.K. agreement is 83%, Germany 78%, U.S. 71%, Mexico 65%, and Italy 62%.

⁴² The interdependence of party and electoral systems is seen in such statements as this, by James S. Coleman and Carl G. Rosberg, Jr., in *Political Parties and National Integration in Africa* (Berkeley: University of California Press, 1964), p. 3, "As noted elsewhere, however, formal political parties in the narrow sense defined herein did not appear until constitutional reforms were introduced providing for (1) the devolution by the imperial government of a sufficiently meaningful and attractive measure of power to induce or to provoke nationalist leaders to convert their movements into political parties and (2) the introduction or refinement of institutions and procedures, such as an electoral system, which would make it technically possible for parties to seek power constitutionally." They add in the footnote to this statement: "The immediate point is, that with few exceptions, African political parties initially emerged through electoral competition."

particularly at a formal level. Our question then is how legitimate is each in the contemporary public mind? As they are complementary institutions, one might hypothesize that feelings toward the one would spill over to attitudes toward the other; and levels of support would therefore be comparable. Let us look at the available evidence.

Table 6 presents the 1966 Wisconsin data on diffuse support for the party system.⁴³

Only on the most extreme of these items—the proposal to strike party labels from the ballot—is there a majority in support of the parties. The remaining four items show that more respondents oppose the parties than favor them, which was also true for a similar survey in Wisconsin in 1964 using the same items. We conclude again that support for the parties is relatively low; and this is especially the case when we compare response on these party system items with the high consensus levels in favor of voting duty (Table 2). On the efficacy-of-elections dimension, public support also appears to be higher than on the political party items (Table 5). Thus, only on the dimension of approval of the electoral process do we find support for elections to dip to levels approaching sentiment about the parties—and even here the comparison favors elections (see Table 4). In no case in Table 4 do those disapproving various aspects of elections outnumber those who favor them—which is not true in the case of the parties (Table 6). These comparisons are indeed very rough, given the differences in object and item content. Yet the general thrust is clear: even on the least favored aspects of the electoral institution, public estimation is higher than for the parties.

Some external evidence from national surveys relevant to this question provides much more direct comparisons and documents the same discrepancy between parties and elections. The Five-Nation study respondents were asked: "We know that the ordinary person has many problems that take his time. In view of this, what part do you think the ordinary person ought to play in the local affairs of his town or district?" The American predisposition for connecting citizenship and voting comes to the fore: 40% of the Americans, but only 18% of the British, 15% of the Germans, 2% of the Italians, and 1% of the Mexicans volunteered "vote."⁴⁴ The contrast with "taking part in ac-

⁴³ See Dennis, "Support for the Party System by the Mass Public," *loc. cit.*, pp. 603 and 605, for presentation of the diffuse support for the party system factor in the 1964 study.

^b Items are presented in order of rotated factor weights.

* Less than 1%.

tivities of political parties" is especially great for Americans: only 6% of Americans gave the party activity response, which is not much greater than several of the other countries: 5% Mexico, 4% U.K., 4% Germany, and 1% Italy. In all of these countries, parties are less salient means of participation than elections, but the differential between the two institutions is much the widest in the United States.

The 1964 Election Study by the University of Michigan Survey Research Center posed two further, highly relevant questions to their respondents:⁴⁵

1. "How much do you feel that having elections makes the government pay attention to what the people think?"
2. "How much do you feel that political parties help to make the government pay attention to what the people think?"

other items which show a similar, if less extreme difference among countries, and between elections and parties as a perceived mode of influence, see *ibid.*, pp. 191 and 203. Also see Milbrath, "The Nature of Political Beliefs . . .," *loc. cit.*

⁴⁵ Codebook of the Survey Research Center 1964 Election Study, Inter-University Consortium for Political Research.

Table 7 presents the response to these questions.

We observe a marked difference in the way the mass public attaches representative significance to the two institutions: elections stand considerably higher.

The rough comparisons of public support for parties versus that for elections as derived from the 1966 Wisconsin data are supported therefore by other relevant data; and the conclusion is that the public finds elections more agreeable to

TABLE 7. RELATIVE EFFICACY OF PARTIES AND ELECTIONS, U.S. 1964

Make the government pay attention:	(Percent)

Percent of Life Spent in Present Place of Residence	-.01	.01	-.02	.01	.02	-.01
Multiple R	.35		.33		.36	

^a Political Party Preference is scored as: strong Republican = 1 . . . strong Democrat = 7; Race is scored: black = 1, white = 2; sex is scored: male = 1, female = 2; ideological self-identification is scored: strong liberal = 1 . . . strong conservative = 5; occupational prestige is scored according to the Otis Dudley Duncan Socio-economic Index as reported in Albert J. Reiss, Jr., *et al.*, *Occupations and Social Status* (New York: The Free Press, 1961). Housewives are given their husband's occupational prestige score.

^b Significant at the .05 level using the t distribution (two-tailed test); partial correlations reported are controlled for all other independent variables in the series.

^c Significant at the .01 level or better.

their needs than it does the parties.⁴⁶ The average member of the public will more likely have internalized the norms of electoral participation than those of partisan competition. The member's cathexis with each will therefore differ—perhaps along the lines expressed by one of Rosenberg's respondents. When asked what part

the average man played in politics, he replied, "not much of a part. The little man votes and that's all . . . the party usually takes over pretty much. They don't think too much about the little man."⁴⁷ Voting and elections are "us"; parties are "them."

⁴⁶ This contrast leaves out of account whether or not the two institutions are interrelated in the public mind. To test for such a relationship, a separate factor analysis of the party and electoral support dimensions was performed using oblique rotation. The latter indicates the degree of relationship obtaining among factors, and thus among dimensions of orientation. What we observe is the following set of correlations:

	Party System Support	Voting Duty	Approval of the Electoral Process
Voting Duty	.28		
Approval of the Electoral Process	.46	.36	
Efficacy of Elections	.32	.20	.27

These correlations constitute the oblique primary

factor pattern matrix, using an independent cluster solution. Their item definitions vary slightly from those reported above, in that a 28 item matrix was used which included 9 items on general political efficacy and trust. Six factors were obtained in the principal component analysis, including the four above. These data show that there are, to a greater or lesser degree, some mutual effects among these various orientations to parties and elections. For example, party system support and approval of the electoral process covary to the highest degree, whereas voting duty and efficacy of elections are least associated.

⁴⁷ Morris Rosenberg, "Some Determinants of Political Apathy," *Public Opinion Quarterly*, 18 (1954-55), 349-366, at p. 356.

Correlates of Support for Elections

One further step of data analysis needs to be taken before we leave this subject. This concerns the question of demographic, political or other correlates of these attitude dimensions. Are there systematic variations on these attitudes among people who differ according to demographic or political attributes of other kinds? Using the 1966 Wisconsin data, we can begin to make some initial estimates. In Table 8, ten independent variables that could be thought to influence the level of affect for elections are correlated with factor scores on each of the election support dimensions.

What we find in general is that the correlations of the independent variables and the factor scores are relatively low. The low magnitude of these correlations means that none is a weighty influence upon support for elections.

A few significant correlations do appear, however, with education being the most prominent. Greater educational attainment improves one's sense of voting duty and approval of the way the electoral system operates; but it decreases one's faith that elections are effective. Almond and Verba's data showed that one of the items used here to measure voting duty, namely satisfaction when going to the polls, evoked a response which was correlated with education in four of the five countries studied. Thus, the first of our findings supports earlier research.⁴⁸ Age is also correlated significantly with the first two factor scores, if negatively. Thus, the youngest adults feel their obligation to participate most strongly and more fully approve of electoral processes. Together the age and education effects in our data suggest the possibility of preadult political socialization influence—something that should become a focus of future inquiry. The only other correlates of note are party preference and income. They correlate significantly in one case each with the electoral support components. In general, our capacity to account for the electoral attitudes by using these ten predictors is limited. We account for 13% or less of the variance in the factor scores by use of these predictor variables in each case.

Another correlational question that we might raise concerns possible effects of these electoral sentiments upon behavior. One behavior of interest here is individual turnout rate over a series of elections. Do our electoral support factors relate significantly to frequency of turnout, when other variables are held constant? Table 9 presents data pertinent to this question.

The table begins, in the top portion, with two more general orientations, political efficacy and

TABLE 9. CORRELATES OF TURNOUT:

political trust, which have been scored on the basis of a separate factor analysis of nine additional survey items.⁴⁹ Political efficacy is rather similar in construction here to the index of the

⁴⁹ The major items are:

Rotated Factor Weight	Political Efficacy
-.73	"Government officials don't care much about what people like me think."
-.71	"People like me don't have any say about what the government does."
-.69	"Sometimes politics and government seem so complicated that a person like me can't really understand what's going on."
-.63	"The people who really run the country do not even become known to the voters."

⁴⁸ *Op. cit.*, p. 151.

same name employed by the Survey Research Center studies of voting behavior. The latter constituted one part of the political involvement dimension reported in *The American Voter*.⁵⁰ The other long-term portion of political involvement is "sense of citizen duty"—which, in the present context, is "voting duty." One of the first questions we might raise is which of these two aspects of political involvement better accounts, in the Wisconsin data, for the variance in extent of voting participation.

Looking at Table 9, we find that voting duty is of considerably greater importance for turnout than is political efficacy. Indeed, when the effects of other variables, such as education, are controlled, the turnout—political efficacy correlation approaches zero. Voting duty on the other hand is the strongest of all of this list of correlates ($r = .36$; partial $r = .35$), and is approached in magnitude only by age ($r = .14$; partial $r = .30$).⁵¹

What does not correlate here is perhaps as interesting as what does. That voting duty, mobility, and age should be positively associated with turnout is hardly surprising given past research. Lack of correlation with political efficacy on the other hand is unexpected on these grounds. *The American Voter*, for example, presented data from the 1956 election that showed a very marked relationship between turnout and politi-

cal efficacy.⁵² We might also have thought that the election support factors other than voting duty would show higher correlation than they do. However else these latter sentiments may serve to differentiate behavior, attendance at the ballot box is not much affected by them.

IV. CONCLUSION

Both those who are concerned about the fate of the regime of democracy in America and those who pitch their theoretical interests at the level of system persistence and transformation are apt to be intrigued by the state of popular opinion regarding that most characteristic institution of popular participation, the election. Certainly the spate of electoral studies of the last generation in political science would suggest such an interest. What the latter studies have not dealt with directly, however, is the condition of elections in popular thinking at the level of the institution. It is the purpose of the present inquiry to initiate that enterprise.

The 1966 Wisconsin data, even when supplemented by the excellent and suggestive research of others, as above, are limited and preliminary to the tasks of measurement and theory construction in this area. If we grant that this initial excursion is only able to be suggestive, we nevertheless obtain thereby some sense of the broad contours of public support for elections. Particularly when we compare earlier American national data, cross-system data, and evidence pertaining to the sister institution of political parties, are we able to sharpen considerably the dim outlines of these preliminary inferences.

The general conclusion is that the institution of elections enjoys a broad base of popular support, most strongly at the level of personal commitment to the norm of voting obligation. Aggregate sense of citizen duty to vote is improving, moreover, rather than decaying, if the slight trends we find are indicative. The future of institutional support on this level looks bright. This is also true when we take account of the correlation of voting duty with education and (negatively) with age. Rising levels of educational attainment and increasing proportions of young people in the adult population should reinforce this trend in coming years. While support is distinctly lower on perception of how elections operate in America, it is nonetheless probably high in comparison with public backing for the parties.

There is a problem which could develop, however, from the gap between the level of feeling of an obligation to participate in elections and the relative perception of the value of the elec-

- .42 "Quite a few of the people running the government are crooked."

⁵⁰ *Op. cit.*, pp. 101-110.

⁵¹ Other variables showing significant correlation with turnout are frequency of religious attendance—which shows that those who go to church more often vote less, and vice versa—and lack of mobility (percent of life spent in present place of residence). The latter is no doubt explained by the legal obstacles present for those who move their residence, and by the tendency of those who remain longest in a community to translate their greater stake in its affairs into higher participation. It is perhaps also interesting and surprising to see in this instance that those who are more mistrustful of politicians and government turn out to vote at a higher rate—perhaps to protect their interests in what for them is a more dangerous and uncertain political world.

⁵² *Op. cit.*, p. 105.

toral process. The problem is that a possible erosion of public confidence in the institution could come about if people increasingly disbelieve that campaigns are worthwhile expenditures of social resources or that elections have an impact on leadership and policy. Under the latter circumstances, a collective sense of obligation to vote could lead increasingly to an overemphasis upon the ritual behavior aspects of voting.⁵³ The smallish negative trend on the efficacy of elections dimension together with the counter-trend on voting duty suggests that we could see an increase in the gap between expectation and perception, or between perceived electoral input

and output. The present small degree of fragility of the electoral institution could become magnified if this gap is increasingly perceived. Future work should turn more directly to this question.

I propose, therefore, that scholarship continue to devise and take such measurements as these. Nation-wide, periodic surveys are particularly desirable if we are to understand more comprehensively and reliably the nature of the processes of development or decline of public sentiment toward this major institution of democracy. While the foundations of diffuse support for the institution of elections appear to be relatively firm for the present and able to withstand considerable stress, the centrality of elections in the democratic scheme of things and in the life of many major political systems make raising the hypotheses tentatively tendered here a matter for continuing empirical concern.

⁵³ For discussion of the symbolic and ritual aspects of voting, see Murray Edelman, *The Symbolic Uses of Politics* (Urbana, Ill.: University of Illinois Press, 1964).

INCUMBENCY AND THE PRESIDENTIAL VOTE IN SENATE ELECTIONS: DEFINING PARAMETERS OF SUBPRESIDENTIAL VOTING*

BARBARA HINCKLEY
Cornell University

I. THEORETICAL SETTING

Compared with the recent substantial strides in presidential election analysis, research on congressional elections has only begun. The majority of studies have been cast within the presidential-election context, with the relationship between the presidential and congressional vote the phenomenon to be explained.¹ The present attention to presidential contests is understand-

* This study is a revised draft of a paper presented at the Annual Meeting of the American Political Science Association, New York, September, 1969. I would like to thank John Fenton, Frank Munger, Allan Sindler, and Ronald Weber who read and commented on this or earlier drafts. My thanks also to the University of Massachusetts for a Faculty Research Grant which facilitated compilation and analysis of data.

¹ See V. O. Key's analysis of Senate and House elections in relation to the presidential vote, *Parties, Politics, and Pressure Groups*, 5th ed. (New York: Thomas Y. Crowell Co., 1964); Milton C. Cummings, Jr., *Congressmen and the Electorate* (New York: The Free Press, 1966); Barbara Hinckley, "Interpreting House Midterm Elections: Toward a Measurement of the In-Party's 'Expected' Loss of Seats," this REVIEW (September, 1967), 694-700; Charles Press, "Voting Statistics and Presidential Coattails," this REVIEW (December, 1958), 1041-1050, and "Presidential Coattails and Party Cohesion," *Midwest Journal of Political Science* (November, 1963), 320-335; Warren E. Miller, "Presidential Coattails: A Study in Political Myth and Methodology," *Public Opinion Quarterly* (Winter, 1955-56), 353-368; and Angus Campbell and Warren E. Miller, "The Motivational Basis of Straight and Split Ticket Voting," this REVIEW (June, 1957), 293-312.

One study of House elections on their own terms is to be found in Charles Jones, *Every Second Year* (Washington, D.C.: The Brookings Institute, 1967), pp. 45-71. And see Jones, *The Republican Party in American Politics* (New York: Macmillan, 1965), pp. 76-90. See also Robert A. Schoenberger, "Campaign Strategy and Party Loyalty: The Electoral Relevance of Candidate Decision-making in the 1964 Congressional Elections," this REVIEW (June, 1969), 515-520.

able because of the inherent interest in such races in a presidential-centered political system and because reliable survey data have been limited to nationwide samples, severely restricting analysis on a state or district basis. And yet without some comparable advances at the congressional level, we cannot assess bases of electoral support nor the numerous assumptions of behavior in Congress as linked to this support, nor attempt a theory of voting behavior that does not consider voting at the subpresidential level. Put simply, the state of research is such that we have only begun to identify and measure the key variables affecting congressional voting outcomes. It is this basic task to which recent research in the field has been directed.

Consider as the core phenomenon for explanation the sharp fluctuations over time in the partisan division of the vote for Senator and Representative. Since studies of voting behavior indicate the stability of party loyalties over time, evidence of sharp shifts in voting outcomes suggest factors other than party cues influencing the vote decision. Among the lines of inquiry opened, studies by Cummings, Press, and Hinckley, following the work of Key, have utilized aggregate election statistics to measure the substantial impact of the presidential vote on House election outcomes.² Donald Stokes has employed a variance components model to measure the relative impact of national, state, and district influences on the vote for Representative in the 1950's. Using aggregate election data and measuring the variation in congressional vote from the national mean congressional vote, Stokes finds that "national," "state," and "district" influences can explain 32%, 19%, and 49%, respectively, of the variation from the mean. He concludes that the large size of the district component "strongly suggests the importance of the congressional candidates, their party apparatus, and issues having a focus in the individual constituency."³ A study by Harvey Kabaker mea-

² See citations, note 1.

³ Donald E. Stokes, "A Variance Components Model of Political Effects," in *Mathematical Applications in Political Science*, ed. John M. Claunich (Dallas: Southern Methodist University, 1965).

asures the impact of turnout on voting for Representative and finds it minimal (i.e., capable of explaining less than 10% of the deviation from "normal" voting, defined as the mean percent of the two-party vote in the district for a twenty-year span).⁴ Each study, it might be noted, treats elections to the House; Senate elections have received no attention. Each is in some way concerned with isolating and measuring major non-idiosyncratic factors affecting congressional voting. And each, necessarily, relies on aggregate election data.⁵

Within this context of inquiry, two related problems of conceptualization and measurement can be identified by comparison against presidential-election studies—problems which can partially explain the lack of advances in the field. For one point, presidential-election analysis has been able to employ a relatively clear-cut tri-partite scheme of "party, candidates and issues" to separate long-term (party loyalty) and short-term (candidates and issues) components.⁶ By contrast at the subpresidential level the conceptualization of variables is considerably more complex since parameters of voting may be linked to the office contested. At the *presidential* level, a turn away from party cues—as evidenced by considerable deviation in voting outcomes from a normal party vote—points toward the short-term factors of a particular election and election year. Whereas at the *congressional* level, a turn away from party cues need not necessarily mean a turning toward such particularistic factors, but rather the existence of congressional incumbency or presidential voting parameters affecting the congressional vote independently of the particular congressional candidates, campaigns, or issues salient on a state or district basis. And clearly it is of considerable interest to students of legislative behavior to assess how much the individual congressman owes the strength of his election to his actions in Congress, the impact of his campaign, or the issues

of the time and place, on the one hand, and how much to the simple fact of his incumbency, on the other.

For a second point, it would seem important to derive a reliable measure of a "normal" or baseline" (minimum) party vote against which to measure and explain deviations in the vote for Senator and Representative. Such a "normal vote" concept—pointing to that stable percentage of voters in a population identifying as Democrat or Republican—has been found useful for presidential-election analysis, but has not been operationalized at the congressional level due to the absence of survey data on a state or district basis. The measures employed by Stokes and Kabaker are efforts in this direction. But in offering a baseline to measure fluctuations derived from averaging the fluctuations themselves, these measures do not permit isolation of the party loyalty factor. It would seem particularly important for congressional-election analysis to separate party loyalty from other stable electoral cues which, by the use of aggregate data alone, could not be distinguished. Thus stable voting for a Democratic Representative over a decade may include both Democratic partisan and House incumbency components. Similarly the strong positive relationship between presidential and congressional voting outcomes which has been noted may combine both partisan and presidential voting components.

II. ANALYTICAL METHOD

One partial solution to this second problem may come from the use of survey-derived estimates of party identifiers on a state or district basis. Recently Ronald Weber and Frank Munger have calculated from nationwide samples the percentage of statewide "participating electorates" for 1956 through 1964 identifying with one or the other of the two parties.⁷ The "participating electorates," in contrast to "eligible electorates," represent the proportions most likely to

⁴ Harvey M. Kabaker, "Estimating the Normal Vote in Congressional Elections," *Midwest Journal of Political Science* (February, 1969) 58-83.

⁵ For initial studies of voter attitudes in congressional elections, based on nationwide survey studies, see Warren E. Miller and Donald E. Stokes, "Constituency Influences in Congress," this REVIEW (March, 1963); "Party Government and the Saliency of Congress," *Public Opinion Quarterly* (Winter, 1962); and *Representation in the American Congress*, forthcoming.

⁶ For utilization of this scheme and the concept of a "normal vote," see Angus Campbell *et al.*, *Elections and the Political Order* (New York: John Wiley & Sons, 1966).

⁷ Ronald E. Weber and Frank J. Munger, "Party Identification and the Classification of State Party Systems," paper represented at the annual meeting of the American Political Science Association, Washington, D.C., September, 1968. The technique for making these calculations—generally analogous to the procedures employed in the MIT Simulations project—calls for synthesizing state electorates by subdividing them into voter-types whose party identification scores are then determined through an additive formula from national survey data. A detailed description of the procedures can be found in Ronald E. Weber, *Public Opinion in the States: A Simulation Approach* (unpublished doctoral dissertation, Syracuse University, 1969).

vote. From these estimates a base line or minimum "party vote" by states can be derived against which deviations in the actual vote outcomes can be measured. While this base party vote by states permits analysis of Senate elections only, similar estimates could be conducted on a district basis; and for purposes of congressional research, the same questions may be asked of Senate and of House elections. Due to the experimental nature of the Weber-Munger estimates, results need to be interpreted cautiously. Nevertheless, the usefulness of a measure of statewide party identification would seem to justify the experiment; and further, when checked against the few state surveys which include a usable party identification question, the Weber-Munger estimates seem well in line with survey results.⁸

Utilizing the Weber-Munger estimates to isolate the party loyalty factor on a statewide basis, it should be possible to identify and measure major variables affecting Senate election outcomes. It would seem important first to determine how much of the fluctuation in Senate voting—here measured by deviations in actual vote outcome from the base party vote—can be explained by such nonidiosyncratic factors as incumbency and the presidential vote. Then and only upon that basis could one define and interpret the range of short-term variability—i.e., the importance of "candidates and issues" in particular senatorial elections. (1) How much of the fluctuation in vote for Senator is explainable by the "pull" of the presidential vote—constitutionally staggered so as to affect alternating Senate elections? Voter turnout regularly and

sharply declines from presidential year to off-year elections and that smaller portion of off-year voters—of measurably stronger party loyalty—may be expected to follow party lines more faithfully than the larger electorate reacting to the stimuli of a presidential campaign.⁹ Indeed, the greater volatility of the congressional vote in presidential years compared to off-years has been widely noted. (2) How much of the fluctuation in vote for Senator can be explained by the impact of Senate incumbency? One stable characteristic of American voting behavior is the tendency to reelect not only House but also Senate incumbents—a fact which merits a wider acknowledgment than it currently enjoys. Given this incumbency advantage, to be documented subsequently, one would expect fluctuations in senatorial vote depending on the presence or absence of an incumbent ticket. Thus states where an erstwhile second or minority party gained the majority support over some time span could appear to shift dramatically in senatorial vote from strong support for one party to the other simply by the retirement of the former majority party's incumbent.

With the Weber-Munger estimates of base party vote by states for 1956 through 1964, one can calculate for each Senate election in the time period the deviation in actual vote outcome from the base party vote. The subsequent analysis is based on all regularly scheduled Senate contests for 1956 through 1966 in the 34 states sufficiently competitive on the statewide level to have elected at least one Senator or one Governor from both parties during the time period. The data base parallels the Weber-Munger estimates and permits comparison of three presidential-year and three off-year elections. Data from simultaneous contests for President and Governor on a statewide basis are supplied for comparative purposes.

⁸ Percentages of Democratic Party identifiers are as follows:

Survey Results	Weber-Munger Estimates	
	"Eligible" Electoralates	"Partic- ipating" Electoralates
California (Roper '58)	54.8	49.8
Minnesota (Roper '56-'64)	44.4	41.1
Ohio (Harris '58)	42.0	42.5
Iowa (Roper '56-'64)	40.1	38.7
		43.1

Party identification results for 1968 from the 13 states of the University of North Carolina's Comparative State Elections Project should soon be available.

III. FINDINGS

Table 1 presents a summary distribution of deviations from the base party vote for the ten-year period. Since this base vote represents a minimum core of statewide party identifiers, the normal pattern in voting outcomes, as would be expected, shows a plus-Democratic deviation. The mean is +5.6; the standard deviation, 9.3. Considering Senate outcomes separately first, the overall pattern is one of dispersion, with con-

⁹ Angus Campbell, "Voters and Elections: Past and Present," *Journal of Politics* (November, 1964), 745-757; and Philip Converse, "The Concept of a Normal Vote," in *Elections and the Political Order*, p. 19.

TABLE 1. ELECTION OUTCOMES MEASURED BY DEVIATION FROM DEMOCRATIC BASE PARTY VOTE
(Percentage Points)

Elections	Extremely Strong Democratic ($\geq +15.0$)	Strong Democratic ($+14.9$ to $+10.0$)	Moderate ($+9.9$ to $+5.0$)	Moderate ($+4.9$ to 0)	Strong Republican (-0.1 to -4.9)	Extremely Strong Republican (≤ -5.0)
Senate (n = 140)	16	16	19	19	16	14
President (n = 70)	20	11	10	23	19	17
Governor (n = 97)	10	15	25	29	13	7

^a The mean of the Senate distribution is +5.6, close to the midpoint of the two "moderate" categories above. Outliers $+14.9$ or more or -14.9 or less (i.e., larger negative numbers) are beyond 1 standard deviation of the mean and are reflected by the "extremely strong Democratic" and "extremely strong Republican" categories above.

tests spread fairly evenly across the range of categories, with this pattern holding for election-by-election and state-by-state analysis. Twenty-seven of the 34 states exhibit a range of deviations in the ten-year span of more than 10 percentage points; 17 of the 34, more than 15 percentage points; 9, more than 20 percentage points. What these figures mean, of course, is that states have shifted in senatorial voting from Democratic to Republican or back—often from strong Democratic voting to strong Republican and back in a relatively short span of time. To take a particularly clear illustration, New Jersey shifted in Senate contests from close to the base party vote in 1958 (+2.7) to 5.5 percentage points below in 1960, to 13.2 percentage points above in 1964, to 11.7 points below in 1966, for a total range of deviations of 24.9 percentage points. Comparing elections for the three offices, state electorates appear to diverge more frequently from moderate voting patterns in the vote for Senator than for Governor. Senate patterns are considerably more similar to the presidential than the gubernatorial pattern. The comparison can be seen more clearly by collapsing the categories from 6 to 3 into strong Democratic, moderate, and strong Republican deviations and noting the percentage of contests in each category:

Election	Strong Democratic ($\geq +15.0$ to $+10.0$)	Moderate ($+9.9$ to 0)	Strong Republican (-0.1 to ≥ -5.0)
Senate (n = 140)	32%	38%	30%
President (n = 70)	31%	33%	36%
Governor (n = 97)	25%	51%	25%

Incumbency

One stable characteristic of American voting behavior is the tendency to reelect not only House but also Senate incumbents. Figures supplied by Lewis Froman, Jr., suggest similar 85%

success rates for both houses.¹⁰ Senate incumbents' average performance at the polls, measured by percentage of two-party vote, is stronger in both parties compared to victors and nonincumbents. And comparing election-by-election, Senator and Governor in simultaneous contests in these 34 states for the past two decades, state incumbents win a considerably higher percentage of their contested races (80% compared to 64%),¹¹ and as Table 2 shows, Senate in-

¹⁰ Lewis A. Froman, Jr., *The Congressional Process* (Boston: Little, Brown & Co., 1967), p. 170. Data on House incumbents, see Jones, *Every Second Year*, pp. 63-68.

Such a similarity may surprise some who hold to the traditional view that the Senate—representing whole states rather than small homogeneous districts—is a much more electorally competitive body. One explanation may be that the incidence of electoral mortality commonly cited for the Senate to show its comparative "competitiveness" are drawn from a very few large urban states marked by highly competitive, active parties. Incumbent success rate for New York, California, Pennsylvania, Illinois, Michigan, and Ohio is substantially lower than the overall rate. Of 11 Senate contests in those states, incumbents won 12 of 19 or 63%—still a definite edge, but not as strong performance as the overall pattern. In these are only 6 of 50 states. The general situation for Senate incumbents is one of electoral safety.

¹¹ The percentages are based on the 167 simultaneous contests between 1948 and 1966 in 14 states sufficiently competitive to have elected at least one Senator or Governor from both parties. The turnout differential between Senate and gubernatorial contests, by state for each section, is found to be virtually nil, supporting the assumption that the election results are produced by substantially the same electorate.

The Senate incumbency advantage is not merely a "second-term" advantage, as it might be thought, since after two full terms or 12 years of Sen-

bents (but not Senate nonincumbents) tend to lead their gubernatorial running mates, whether incumbent or not.

TABLE 2. EFFECT OF INCUMBENCY ON VOTE LEADER: SENATE AND GUBERNATORIAL RACES COMPARED^a

Incumbency	Total Simultaneous Contests	Number of Contests Senator Leads	Number of Contests Governor Leads
Incumbent Senator	27	17	10
Incumbent Governor			
Incumbent Senator	38	30	8
Nonincumbent Governor			
Nonincumbent Senator	13	3	10
Incumbent Governor			
Nonincumbent Senator	29	15	14
Nonincumbent Governor			
Total	107	65	42

^a Based on the 107 simultaneous contests, 1948-1966, where the same party won both Senate and gubernatorial contests. One contest (Wisconsin, 1960) was excluded, with no percentage difference between the candidates.

With this electoral advantage enjoyed by Senate incumbents of both parties, can incumbency help explain the sharp fluctuations in Senate voting? Dividing the Senate deviations reported above into incumbent and nonincumbent elections, one finds a statistically significant relationship between incumbency and strong versus moderate deviations from the base party vote, with this relationship holding for both presidential-year and off-year elections.¹² The shape of the two distributions is reversed with Senate nonincumbent contests distributed similarly to the gubernatorial results presented earlier and Senate incumbent contests considerably more dispersed and similar to the presidential voting

service, the advanced age of incumbents compared to more youthful opponents might depress their success rate. But the data show no decline in success rate for third- or fourth-term tries. Based on all Senate contests in the period in the 34 states, incumbents trying for a second term won 77%; for a third term, 78%; and for a fourth term (37 tried), 81%.

¹² As reported in the text, $\chi^2 = 7.9$; significant at .01, 1df. For presidential years, $\chi^2 = 7.31$, corrected for continuity, significant at .05, 1df; for off-years, $\chi^2 = 4.10$, significant at .05, 1df.

For this study, an incumbent is defined as any Senator *in office* at the time of the election. Thus the category would include some small number of Senators previously appointed and not previously elected.

distribution. (The comparative data for governors indicates no similar effect for incumbency in explaining deviations in gubernatorial voting).

	Strong Democratic	Moderate	Strong Republican
Senate Elections			
Incumbents (n=95)	37%	31%	33%
Nonincumbents (n=45)	22%	53%	25%
Gubernatorial Elections			
Incumbents (n=32)	28%	47%	25%
Nonincumbents (n=65)	23%	52%	25%

Such a clear difference between the two kinds of Senate contests supports the hypothesis that Senate incumbency can help explain the sharp fluctuation found in Senate voting. To illustrate from the New Jersey case cited above, in an election with no incumbent victory, the state held close to the Democratic base party vote; twice when Republican incumbents won, it shifted sharply below (-5.5 and -11.7); and with a Democratic incumbent victory, shifted sharply above (+13.2).

Presidential Vote Deviations

It is also possible that the widely noted "pulling power" of the presidential vote exerts an additional impact on Senate outcomes in presidential election years, producing strong performances for Senate candidates in states where the affiliated presidential candidate also ran strongly, and less strong Senate performances where the affiliated presidential candidate ran only moderately well or poorly. If such a relationship exists, it would be marginal at most, since sharp deviations in Senate voting were found as frequently in off-years as in presidential-election years.

Relating the presidential voting deviation from the base party vote in all presidential-year elections by states to the deviation for affiliated Senate candidates yields a strong positive relationship ($r = .70$) which has been summarized in Table 3. The stronger the presidential candidate ran in a state, the stronger the affiliated Senate candidate ran, as measured against the state's base party vote. The implications of this point in relation to earlier research should be noted. Past studies by Key, Cummings, and others have documented the close relationship between presidential and congressional voting, but it was never possible to control for the underlying partisan division in a state or district to observe the *separate* impact of presidential voting on congressional races. This investigation corroborates the earlier studies by pointing to a

TABLE 3. RELATIONSHIP BETWEEN PRESIDENTIAL AND SENATE VOTING MEASURED BY DEVIATIONS FROM THE DEMOCRATIC BASE PARTY VOTE

Presidential Vote Deviation ^a (in percentage points)	Num- ber of Con- tests	Senate Vote: Mean Deviation from BPV
Extremely Strong Democratic ($\geq +15.0$)	14	+16.0
Strong Democratic (+14.9 to +10.0)	8	+12.4
Moderate (+9.9 to +5.0)	7	+ 5.1
Moderate (+4.9 to 0)	16	+ 6.0
Strong Republican (-1 to -4.9)	13	+ 3.2
Extremely Strong Republican (≥ -5.0)	12	- 2.6

^a The mean deviation for the presidential vote is +4.7; standard deviation, 19.0. As reported earlier, the distributions for presidential and Senate voting are quite similar.

strong relationship between presidential voting over and above the effect produced by stable party loyalties.

The explanatory power of these two variables on Senate fluctuations can be summarized more generally. Correlation analysis—a mode of statistical analysis suited to the exploratory nature of the inquiry—indicates for presidential-year elections a strong relationship ($r = .60$) between Senate Democratic incumbency, no incumbency, and Republican incumbency and deviations in the Senate vote. Combining both variables, the multiple correlation coefficient $R = .81$ indicates that 66% of the variation in the Senate vote over and above the base party vote can be statistically explained by these two variables.¹³ For all elections—presidential-year and off-year—incumbency is strongly related to deviations in Senate voting ($r = .67$) and presidential-vote deviations register an independent though less strong relationship ($r = .40$). A multiple R of .80 indicates that of all the Senate voting fluctua-

¹³ Incumbency was quantified by assigning a "3" to Democratic incumbent victories, a "2" to non-incumbent victories, and a "1" to Republican incumbent victories. The partials for incumbency and Senate deviations controlling for presidential-vote deviations are .42 and for presidential-vote deviations and Senate deviations controlling for incumbency, .58.

tion exhibited in the ten-year time span, 64% of this fluctuation can be statistically explained by these two nonidiosyncratic variables.¹⁴ Of course some considerable variation remains unexplained and this may well be an area for investigation of regional, demographic, or campaign-based influences.¹⁵

IV. IMPLICATIONS

The findings indicate that one cannot take the simple datum of fluctuations in vote as a measure of electoral response to idiosyncratic or campaign-based factors—the "candidates and issues" of particular campaigns and election years. Senate incumbency appears to be a stable factor affecting outcomes regardless of the year or the particular candidate involved; and a similar effect exists for the impact of presidential voting in Senate elections, although this vote may itself vary with presidential-election short-term forces. And so only by first isolating the fluctuations which cannot be explained by incumbency and the impact of the presidential vote could one begin to investigate the ways and the conditions under which candidates and issues affect congressional contests. Judging by the present findings, it is possible that some large proportion of Stokes' "district" component registers the impact of House incumbency rather than the idiosyncratic effects of candidates and issues.

The Senate incumbency advantage has wider implications for legislative behavior research. The explanation—in voter attitude or information—for this electoral advantage is not yet known. It may simply be that an incumbent is more widely known than his opponent—due to the publicity available as a member of the Senate, the franking privilege, etc.—and that with

¹⁴ In order to conduct correlation analyses for all elections, "presidential-vote deviations" for the off-years was quantified as the mean presidential vote deviation for presidential years (+4.7) rather than 0, which would have indicated a pro-Republican deviation. Thus a +4.7 deviation for off-year elections should indicate neither a pro-Republican nor pro-Democratic pull of the presidential vote operating on the Senate election results. The partial for presidential vote and Senate vote deviation controlling for incumbency is .35.

¹⁵ All 34 states were somewhat competitive by definition during the time period, but a check was carried out by ordering the states from high to low Democratic base party vote (thus in order of increasing two-party competition) following the Weber-Munger scheme, with no relationship observable between this ordering and the amount of deviation.

generally low levels of voter interest and information about Congress, voters will tend to vote for the more familiar (less unfamiliar) name. Or it may be, as Joseph Schlesinger suggests, that Senators accumulate electoral support with increasing years of service, in contrast to Governors who accumulate grievances,¹⁶ an interesting hypothesis of difference between legislators and executives. The claim to "experience," the promise of the advantages of seniority, the remembrance of past favors received, may contribute to the accumulation of voter support. It should be noted that these alternative explanations presuppose different levels of voter interest and information. The Schlesinger explanation points toward voter awareness of Senator X and his senatorial activity whereas the first explanation presupposes no understanding of the Senate or of the advantages of seniority but simply points toward either the recognition of a less unfamiliar name or of the fact that X is a "Senator." Since this incumbent advantage holds on a nationwide basis, more intensive research on the linkage between voter interest and incumbency would seem possible through existing survey facilities and well worth pursuing. To the extent a Senate or House incumbent is reelected mainly

by virtue of his incumbency and not by his behavior in Congress or his constituency relationships or the attributes of a particular congressional campaign, then, these latter factors—stressed in journalistic analysis of congressional elections—are considerably reduced in importance.

Further, the contrast between Senate and gubernatorial results raises a key theoretical point—that voter behavior varies with the office contested. Incumbency is a key variable for understanding Senate and House elections, but preliminary analysis suggests less explanatory power as applied to contests for Governor. Incumbent governors enjoy a considerably lower success rate than incumbent senators. And incumbency, which helps explain deviations in Senate voting, does not hold similarly for gubernatorial contests. The presidential vote similarly may have a varying impact by office. Recent survey studies suggest a stronger relationship between presidential-congressional contests compared to national (presidential)-state contests. These two points in turn suggest that party loyalty itself may vary in salience as a cue-giver for electoral choice depending on the office contested. Continuing studies of subpresidential elections should provide evidence for assessing the impact of office on election results. And with the development of a measure of base party vote by states which can facilitate aggregate data analysis such studies would now seem possible.

COMMUNITY STRUCTURE AND INNOVATION: THE CASE OF PUBLIC HOUSING*

MICHAEL AIKEN AND ROBERT R. ALFORD

University of Wisconsin

Innovation can be defined as "... the generation, acceptance, and implementation of new ideas, processes, products, or services."¹ We mean here an activity, process, service, or idea that is new to an American city. We do not restrict it to mean only the first appearance ever of something new (i.e., an invention) or only the first use by one among a set of social actors.² We are concerned neither with the diffusion of innovation nor with internal stages in the adoption process, but rather with the characteristics of cities that have successfully implemented innovations in federally financed public housing. We focus on three aspects of community innovation: (1) the *presence or absence* of a federally

financed public housing program in the city; (2) the *speed* of innovation of such a program; and (3) the level of *output* or performance of the innovation activity.

Most of the studies of innovation have used as units of analysis either individuals or organizations, and little attention has been given to innovation in community systems, although community systems are continually introducing new ideas, activities, processes, and services. For example, the form of government may be changed from a mayor-council to a city-manager type. In fact, two studies of such innovations were carried out prior to World War II, but these were primarily concerned with describing the rate of diffusion of this social invention among American cities, not with characteristics of innovative cities.³ The addition of a new planning department to the city administration or a decision to fluoridate its water system are community innovations as we have defined the term.⁴ But innovations are not limited to actions of city government, although these may be the most frequently observed types of innovations. A Chamber of Commerce may innovate by creating an economic development agency, or a community may enter the "War on Poverty," neither of which necessarily involves the formal machinery of municipal government, at least not at the outset.

We are interested not only in the incidence of innovations, but also in the speed of the innovation. For example, among communities that have instituted planning departments, there may be significant variation in the speed with which the innovation took place. The community attributes associated with the incidence of an innovation may be quite different from those that account for the speed with which it is adopted.

Still a third aspect of community innovation is the level of output or performance of the innovative activity. Some community innovations involve repetitious and cumulative activity. Af-

ter successfully entering the public housing program, a community may implement a succession of discrete housing programs. After establishing a Community Chest agency, the amount of money contributed by citizens may vary from year to year. Not all community innovations involve this kind of performance or outputs. For example, changes in laws regulating zoning, traffic control, or liquor licenses may be innovations, but they need be neither cumulative nor repetitious. Thus the characteristics of level of output or performance of innovations in community systems are not common to all innovations.

Political scientists have shown concern for certain aspects of what we call community innovation, often using the term "policy outputs." Salisbury explicitly raises the question of the conditions under which policy innovation, as distinct from merely incremental additions, occurs.⁵ He suggests, as we do, that the several dimensions of adoption or nonadoption of an innovation, its speed, and the volume or quantity of outputs may be usefully distinguished and analyzed. Similarly, Lowi distinguishes three types of public policies—distributive, regulatory, and redistributive—which differ in the level of disaggregation of benefits.⁶ At one extreme are distributive policies in which groups come into no direct conflict with each other; there is "something for everyone," and there are multiple points of access to decision making. At the other extreme are redistributive policies which are essentially zero-sum policies. While he does not concern himself with innovation *per se*, what we have called innovation in public housing could be considered to be a distributive type of public policy.

Froman's distinction between areal and segmental policies may also be related to the incidence, speed, and output of innovation in a community.⁷ Those issues which directly affect only a few people, affect different people at different times, and are continuously or repeatedly raised (segmental policies) may be much easier to innovate than the opposite types of issues.

Several scholars have tentatively accepted the

proposition that "governmental policy making is incremental in nature; sharply innovative decisions are rarely made,"⁸ basing this judgment on expenditure studies which find that the previous year's expenditures are the best predictor of this year's expenditures.⁹ While this may be granted, the fact that there are sharp variations from city to city (or state to state, in Sharkansky's study) means that aggregate expenditures might better be regarded as a mosaic of past innovations which have become embedded in continuing commitments to varying levels of outputs or performance. If we are interested in explaining the great differences in the substance of innovative policy making, we must take into account the historical processes which have led some political systems to innovate in the past and not others. Many innovations are not simply discrete decisions with no impact on the future, but policies with cumulative consequences.

Our study does not deal with all of these theoretical and methodological issues. We are primarily concerned with the underlying structural properties and community processes that explain why some communities moved quickly to enter the public housing program and have built a great number of housing units, while others were slow to innovate this program and still others have never participated at all in this federal program.

In this paper we link a study of public housing innovation to theories of a variety of studies on policy outputs—urban renewal, fluoridation, voting on bond issues, desegregation, and the like.¹⁰ This paper is one of a series by the authors on different federal programs.¹¹

Some Theories of Community Innovation

Nowhere have the various explanations of community innovation been brought together. In part this lack of theoretical integration is due to diverse concepts, since what we have called innovation has been called community decision making, community decision outcomes, and policy outputs. The five theories explaining innovation are:

(1) *Political Culture*: Cities with majorities holding "public-regarding values" are hypothesized to be more innovative with respect to policies benefiting the community as a whole than cities dominated by groups with "private-regarding values."¹²

(2) *Concentration or Diffusion of Community Power*: There are three aspects to this argument: concentration of systemic power,¹³ diffusion of power through mass citizen participation,¹⁴ and centralization of elite power.¹⁵ In each case the hypothesis is the same, namely, the greater the concentration of power, the greater the degree of innovation. Conversely, the greater the diffusion of power, the lower the degree of innovation.

ture: Cities with centralized administrative arrangements and a strong mayor, that is, cities with city manager or partisan mayor-council governmental structures are hypothesized to be more innovative.¹⁶

(4) *Community Differentiation and Continuity*: Older and larger cities have been hypothesized to be more bureaucratic and consequently less receptive to policy innovations, suggesting that younger and smaller cities should exhibit higher policy innovation.¹⁷

(5) *Community Integration*: Cities in which community integration breaks down or is extremely low have a lower probability of innovation or other collective actions. Consequently innovation should be highest in integrated communities.¹⁸

We have presented these five explanations separately because it is possible to conceive of them as five independent factors in the innovativeness, speed of innovation, and intensity of outputs in a community political system. One or more of these factors may be either spurious or intervening variables for the operation of another, more fundamental factor. We shall return to the logic of the interrelationships of these explanations later.

The indicators of the theoretical variables of interest to the various investigators have been quite diverse, overlapping, and sometimes used for quite different concepts. City-manager government, for example, has been used both as a direct measure of governmental centralization and as an indicator of "public-regarding" values. The educational level of the community has been used both as a measure of a propensity for high political participation and as a measure of need. This diversity in the use of the same empirical indicators is partly a result of the great "distance" which the data from available sources such as the U. S. Census and the *Municipal Year Book* are from the theoretical variables of greatest concern to most scholars.

Most of the data we shall use are no better, but we have the advantage of bringing together most of the different types of indicators used in the previous literature, rather than considering only two or three of them. But we have several measures in addition which, while they possess defects of their own, have the merit of being considerably closer to the theoretical variable to which they refer.

We turn now to a description of the various measures of innovation in public housing which we shall use in this paper, a brief discussion of sources of other data on community characteristics, and the methodology employed here.

I. DATA AND METHODS

The findings of this study are based on the universe of 646 incorporated urban places of size 25,000 or more in 1960 that were also in existence in 1930. Thirty cities which did not appear in the census volumes in 1930 have been excluded.

Participation in the federally financed housing programs, beginning with the National Industrial Recovery Act (NIRA) of 1933, is our indicator of community innovation. An understanding of this program requires some background in the history of public housing legislation in the United States.

*History of Public Housing in the United States*¹⁹

Public housing in the United States was a child of the Great Depression, with the exception of a small-scale housing program during World War I. The fact that "... millions of people had left the middle class for the subsistence level or worse ... created a tremendous pressure for government housing. ..."²⁰ But this pressure did not produce a program which fused slum clearance with adequate public housing, something which still does not exist. The Public Works Administration (PWA), created by the National Industrial Recovery Act (NIRA) of 1933, began to buy land, clear houses, and build public housing. Under this legislative mandate of the NIRA, the PWA constructed 21,000 units in 50 low-rent housing projects in 37 cities, and

the Resettlement Administration constructed another 15,000 units in a number of resettlement projects and "Greenbelt" towns. But the housing and other activities of the NIRA were stopped by a federal court decision in 1935 which held that eminent domain could not be used to clear slum property and to then "... construct buildings in a state for the purpose of selling or leasing them to private citizens for occupancy as homes." This decision was never appealed, possibly because "... the outlook for the New Deal programs before the Supreme Court looked dismal in 1935. ..."²¹

The next significant commitment to public housing by the federal government occurred on September 1, 1937, when the United States Housing Act (USHA), under Public Law 412, was approved. It was the purpose of this legislation

... to provide financial assistance to the States and political subdivisions thereof for the elimination of unsafe and insanitary housing conditions, for the eradication of slums, for the provision of decent, safe, and sanitary dwellings for families of low income, and for the reduction of unemployment and the stimulation of business activity. ...²²

Local housing authorities were responsible for the construction, ownership, and operation of these federally assisted low-rent housing programs. However, state enabling legislation authorizing and empowering these local public agencies had to be enacted in states not already having such legislation.²³ In this federal and local government partnership, the federal government made loans (not to exceed 90 per cent of the development costs) and provided annual subsidies for such projects. Local municipalities were required to pay the equivalent of 20 per cent of the federal contribution (although their contribution was often in the form of a tax exemption). In 1940, Public Law 671 applied the provisions of the USHA to defense housing. By 1948, a total of 189,000 low-rent housing units had been built in the United States, 168,000 of

²³ It is, and has been, possible for the tribal housing authorities on Indian reservations located in states not having state enabling legislation to develop low-rent housing projects.

these having been built under USHA of 1937.

Perhaps the most significant and far-reaching commitment to public housing by the federal government occurred with the Housing Act of 1949 (Public Law 171) which was signed into law by President Truman on July 15, 1949. The preamble of this legislation follows.

The Congress hereby declares that the general welfare and security of the Nation and the health and living standards of its people require housing production and related community development sufficient to remedy the serious housing shortage, the elimination of substandard and other inadequate housing through the clearance of slums and blighted areas, and the realization as soon as feasible of the goal of a decent home and a suitable living environment for every American family, thus contributing to the development and redevelopment of communities and to the advancement of the growth, wealth, and security of the Nation.²⁴

Numerous amendments to this legislation have been made in the ensuing years, although the structure of the program remains basically unaltered. The federal government's major role has been in the creation of a revolving loan fund to aid local housing authorities in the construction and development of low-rent housing projects and the provision of grants which are limited to the amounts and periods necessary (annual contributions) in order to assure the integrity of the low-rent nature of these housing programs.

In addition to having a local housing authority (which of course assumes that the state in which the city is located has passed appropriate enabling legislation), the local housing authority must demonstrate to the satisfaction of the federal government that there is a need for such low-rent housing not currently being met by private enterprise, must obtain the approval from the local governing body of its application for a preliminary loan from the federal government,²⁵ and must sign a formal contract with the local

governing body which grants a tax-exempt status to the low-rent housing project.

There are a number of distinguishable steps that a local community goes through in the "conventional bid method" of participation in the low-rent housing program as established by the United States Housing Act of 1937. Some of the major steps in this method are as follows: (1) the application for a program reservation (which of course can be made only by a local housing authority), (2) the approval by the federal government of the application for a program reservation, (3) the execution of a preliminary loan contract for surveys and planning (which requires the approval of the local governing body but which is an optional step), (4) the execution of the annual contributions contract between the local housing authority and the Department of Housing and Urban Development (which can be signed only after the local housing authority and the local governing body have signed a cooperation agreement granting tax-exempt status to the project and, as of 1956, only if the community has a workable program outlining plans for the eradication of slums), (5) site acquisition, (6) the advertising, opening, and awarding of construction contracts, (7) the start of construction, (8) the final completion of construction, and (9) the full availability and occupancy of the housing project. Some other programs under USHA 1937 such as the "flexible formula" for acquisitions and the leasing programs do not require the negotiation of each of these stages, however. Other programs, such as the "turnkey" program, were administratively implemented after 1965, based on already existing powers.

There have been a number of important amendments and additions to the provisions of the Housing Act of 1949 and the basic authorization in USHA 1937. For example, the 1954 amendments made it mandatory that the local housing authority make payments to the local governing body in lieu of taxes, usually at the rate of ten per cent of shelter rents. The amendments of 1956 were such that the annual contributions contract could not be executed without the local governing body having a workable pro-

²⁴ "National Policy and Purpose: Excerpt from the Housing Act of 1949," *Basic Laws and Authorities on Housing and Urban Development*, *op. cit.*, p. 1.

²⁵ It is not required that all housing authorities participating in the programs as authorized and amended under the Housing Act of 1949 obtain a preliminary loan for surveys and planning. Some housing authorities have sufficient resources to do such surveys and planning on their own. In addition, the leasing program that was established by the 1965 amendments requires neither a preliminary loan, cooperation agreement, tax exemption, nor workable program. These, however, do not apply

to leasing or privately owned accommodations. For three of the 646 communities in this study, the first program the community developed was a leasing program. Two (Amsterdam, New York, and Lansing, Michigan) had previously executed a preliminary loan with the Department of Housing and Urban Development; the third, Vallejo, California, had not, however. The procedure used for taking this into consideration is described below.

gram for the prevention and elimination of slums. The 1959 amendments also permitted low-income single persons aged 65 and older to become tenants of low-rent housing programs, changed the general age requirements to conform to the Social Security Act, and granted greater control to the local housing authority for establishing income limits and rents. The 1961 amendments were concerned to a great extent with provisions for low-rent housing for the elderly. The 1964 amendments eliminated the requirement (established in the Housing Act of 1937) that the local contribution should be at least 20 per cent of the amount of the federal contribution. Among other things, the 1965 amendments established a new program, the leasing program, which permits the local housing authority to lease low-rent housing units from private owners. The turnkey program, also developed in 1965 (but based on the prior legislation), permits local housing authorities to purchase low-rent housing units from a private developer or builder after construction or rehabilitation is completed. On December 24, 1969, Public Law 91-152, Section 217, did away with the "workable program" requirement previously described.

A number of states have their own public housing programs. It is possible that some findings might be accounted for by the presence of large state housing programs in cities which have thus not had the incentive to seek federal funds. However, most of the states with state public housing programs are also those states containing cities with a higher level of federal funding for housing: New York, Massachusetts, Connecticut, and others. It may be that the same factors which are conducive to a city undertaking housing programs also further state programs, but, in any case, it cannot be argued that state housing compensates for or obviates federally supported housing.

It is important to note that federal legislation did *not* require the establishment of new governments or new agencies to implement the housing programs, although in many cases a special housing authority was created. "While this has frequently been the end result of the federal legislation, the reasons for it . . . are not reflective of federal 'coercion' or even of strictly federal influences."²⁶ Thus, the "local organizational response" is not simply a function of federal requirements, but rather something influenced in major respects by local conditions. Also, the

state enabling legislation does not define the conditions under which communities shall or shall not act. We shall assume, therefore, that within fairly well-defined limits set by the state and federal statutes and administrative rulings, local communities are free to apply or not apply for federal housing funds. We also assume that the various modifications of the original legislation did not significantly alter the differential incentive from city to city to obtain these funds.

Indicators of Community Innovation and Other Variables

The incidence of innovation we measure by whether or not a community has participated in any public housing program since 1933, i.e., the NIRA of 1933 or the USHA of 1937 and amendments to it, including the Housing Act of 1949. Of the 646 cities included in this study (30 cities that did not exist in 1930 were excluded), 393 (or 61 per cent) had innovated a federal public housing project. Only 33 cities had first entered a public housing program under NIRA while an additional 151 cities first began a federal public housing project under the USHA of 1937, but prior to the Housing Act of 1949. Finally, 209 additional cities began a public housing project for the first time between 1949 and June 30, 1966, the cutoff date of this study. There are, therefore, 253 cities in our study which had not initiated a public housing project as of June 30, 1966.

The speed of innovation is measured by the number of years after 1933 before a community began construction on its first housing project. The degree of skewness of the distribution toward the lower end was not sufficient to warrant a transformation of this scale.

Since a local community could not participate in a federal public housing program unless the state in which it is located had first enacted appropriate enabling legislation, there is some question of whether or not this measure reflects local initiative alone. Ohio was the only state that had appropriate enabling legislation for public housing in 1933. In 1934, seven additional states enacted such legislation, and the following year ten more followed. By the end of 1937, 30 states had such laws on their books, and by 1940, the total was 39. But the remaining 11 states were slow to enact such legislation. As of 1949, only five additional states had enacted this enabling legislation, bringing the total to 44. All states with exception of Utah and Wyoming had such legislation as of June 30, 1966, but as the reader has observed, there was a great disparity in dates at which communities could legally have entered the federal programs in public housing.

Number of public housing units constructed per 100,000 population (natural logarithm)				X

*** P < .001

Note: The number of cases is 646 except for the proportion of registrants voting, which is 411. The presence of participation in any public housing program and two of the political structure variables were treated as "dummy" (binary) variables for purposes of correlations and regression analyses. The natural logarithms of four highly skewed variables were used for correlation analysis, in order to produce an approximately normal distribution.

In an attempt to account for this, a second speed of innovation measure was constructed: the number of years it took a community to begin construction in its first public housing project *after state enabling legislation was enacted*. This distribution was also skewed toward the lower end of the scale, but again a transformation was not called for.

The *level of output* of this type of community innovation is the number of low-rent public housing units constructed since 1933 per 100,000 population. This variable was transformed into its natural logarithm, because of its degree of skewness.

The relationships among these various indicators of community innovation are shown in Table 1, and, as shown there, they are quite high.

The various measures of community structure were taken from the *Municipal Year Books* of 1963 and 1964, the 1950 Census of Housing, the 1960 Census of Housing, and the 1967 *County and City Data Book*. The information for coding the various innovation measures described below was taken from Report S-11A, *Consolidated Development Directory*, Statistical Branch, Housing Assistance Administration, De-

partment of Housing and Urban Development, Washington, D.C., June 30, 1967, and from information provided by the Office of Counsel, Housing Assistance Administration, Department of Housing and Urban Development, Washington, D.C.

We employ correlation coefficients to express relationships among variables and statistical tests of significance to establish the strength of association. Since the cities that are included in this study constitute the population of all the incorporated urban places of size 25,000 or more that were in existence in 1930, one may question the appropriateness of using statistical tests of significance. We use statistical tests of significance for two reasons. First, even given that we have exhausted all units in the universe, statistical tests are still appropriate since there is the possibility that the observations here were produced by errors of measurement. Second, in the absence of any other systematic criterion to establish the strength of a relationship, statistical tests of significance can be used.²⁷

* $P < .05$ ** $P < .01$ *** $P < .001$ ^a U. S. Census of Population, 1960.^b *County and City Data Book*, 1967. The Democratic vote is the county presidential vote in 1964. The two cities for which data were not available (Washington, D. C., and New York) were assigned to the mean category.^c *The Municipal Year Book*, 1963 (International City Managers' Association, 1963). Four or five cities with missing data on one or more of the measures of political structure were assigned to the mean category. The categories for the number of members of the city council were collapsed as follows: 3-4, 5, 6, 7, 8, 9, 10-19, 20-29, 30-50. Means for this table were based on the full distribution.^d Data are from a survey taken by Eugene C. Lee, Director, Institute of Governmental Studies, University of California at Berkeley.

TABLE 2.—(Continued)

Theoretical Categories and Empirical Indicators	Presence of Innovation	Speed of Innovation		Level of Output
	Presence of Innovation in Any Public Housing Program Since 1933	Number of Years After 1933 Before Construction Began on the First Housing Project	Number of Years it Took After State Enabling Legislation Was Present	Number of Public Housing Units Constructed per 100,000 Population (Natural Logarithm)
<i>Community Integration</i>				
Per cent unemployed ^a	.34***	-.31***	-.25***	.36***
Per cent migrant ^a	-.23***	.20***	.08*	-.24***
<i>Poverty</i>				
Per cent of housing dilapidated, 1950 ^a	.31***	-.36***	-.34***	.36***
Per cent of families with less than \$3,000 income per year, 1959 ^a	.40***	-.46***	-.44***	.45***
Per cent adults with less than five years education (natural logarithm)	.52***	-.52***	-.40***	.55***
Per cent 14-17 year olds in school ^a	-.40***	.41***	.36***	-.44***
Per cent of population that is non-white (natural logarithm)	.43***	-.49***	-.44***	.48***

We include in our analysis cities which have innovated and those which have not, because we are concerned with the conditions under which innovations take place, not primarily with the conditions affecting the intensity and scope of outputs after innovation has occurred. If those cities without any federally financed housing are excluded, the relationships found are attenuated, but remain in the same direction in almost all cases. The magnitudes of the correlations for the speed of innovation remain most similar to the original ones.

II. FINDINGS

The data testing the various theories of community decision making or policy outputs as they are related to community innovation in public housing are found in Table 2. Although there is some overlap in the indicators of the different theoretical variables, a given indicator

(February, 1969), 42-46; and Robert F. Winch and Donald T. Campbell, "Proof? No. Evidence? Yes. The Significance of Tests of Significance," *American Sociologist*, 4 (May, 1969), 140-143. For a recent dissenting view, see Denton E. Morrison and Ramon E. Henkel, "Significance Tests Reconsidered," *American Sociologist*, 4 (May, 1969), 131-139.

has been classified under only one theoretical concept, usually the first time it is discussed.

First, *political culture*: Voters holding "public-regarding values" are hypothesized by Banfield and Wilson to be more supportive of policies benefiting the community as a whole than voters with "private-regarding values." Banfield and Wilson used voting behavior in local bond and other expenditure referenda in several American cities as indicators of policy choices, and they used ethnicity, Protestantism, and income level as measures of groups likely to hold public- or private-regarding values. They predicted that public-regarding voters would be more likely to favor metropolitan reorganization, "reform" governmental structures, regional planning, and fluoridation.²³ It should be noted that their work focused on comparisons of voting behavior differences in wards within several American cities. In a supposed testing of their hypotheses, Wolfinger and Field compared policy outcomes for issues such as urban renewal in larger American cities, and they strongly criticized, on both theoretical and empirical grounds, the work of

²³ Banfield and Wilson, *op. cit.*, pp. 33-46; and Wilson and Banfield, *op. cit.*

Banfield and Wilson, although Wilson has maintained that the thesis developed and tested by Wolfinger and Field was not theirs.²⁹ In spite of the question of authorship of the Wolfinger and Field statement about political ethos and policy outcomes in cities, it remains an important and provocative hypothesis which merits testing with other kinds of public policies and with additional, and perhaps better, measures of the independent variable. Our assumption is that the more voters with characteristics presumably predisposing them to hold public-regarding values, the more likely a city should be to make public-regarding decisions.

Therefore, cities having a low proportion of foreign stock, a small proportion of Catholics (as measured by the proportion of elementary school children in private schools), and a high proportion of the population that is middle class (as measured by median family income) should be more influenced by public-regarding values, and, hence, should have higher levels of performance on policies which do not directly benefit the persons voting. Such cities should presumably have more federal public housing.

Democratic presidential voting in the county in 1964 can be utilized as an additional indicator of private-regarding values. Cities that are heavily Democratic are likely to have greater ethnicity ($r = .34$), have many Catholics ($r = .23$), and be heavily working class in terms of proportion blue collar ($r = .22$), but there is no relationship with median family income ($r = -.03$). Although one might debate the use of Democratic voting in this way, if this line of reasoning is accepted, then we should find that Democratic communities are less likely to have public housing.

In Table 2 are shown the 16 relationships between the four indicators of political culture and the four indicators of community innovativeness. The political culture hypothesis is weakly confirmed for the two indicators of ethnicity and religion since cities with few persons of foreign stock and few children in private schools were more likely to innovate public housing. However, these relationships either become insignificant or reverse when they are computed for cities within the North and South separately.³⁰ The original relationships are thus due to the

great differences between North and South in ethnicity and religious composition. In the case of the two remaining indicators of political culture, median income and Democratic vote, the findings are clearly in the opposite direction from the public-regardingness hypothesis. These relationships remain the same in both North and South, with only one exception. In the South, there is no relationship between the Democratic vote in the county and the second measure of speed. The political culture hypothesis is thus not supported.

Second, *concentration or diffusion of community power*: We refer here to three related explanations of community structure and consequences for the distribution of power: (1) the ecological or systemic theory which sees power as a property of dominant institutions, (2) a citizen participation theory which argues that structural features which increase mass participation will as a consequence diffuse power, and (3) an elite participation theory which argues that the smaller the number of elite participants and the more homogeneous their interests, the more concentrated the power structure. We can test all but the last theory with quantitative data parallel to those already presented. While they differ in the feature of community organization which they single out as the critical measure or cause of concentration of power, they share the general assumption that the fewer the actors, whether citizen or elite, or the fewer the number of managerial functions, the more concentrated the power. The further inference that diffused power arrangements lead to less innovation is not always explicitly stated, but we believe that it is a justified extension of the theories to be discussed.

In his study of urban renewal, Hawley argued an *ecological* or *systemic* theory that communities with a greater concentration of power will have a high probability of success in any collective action affecting the welfare of the whole.³¹ He postulated two types of power: (1) functional power which is required to execute functions and (2) derivative power which spills over into external relationships and regulates interactions between parts (units) of the system. In relatively routine issues, he suggested that power is exercised through established and well-worn channels. But for nonroutine decisions affecting the entire system (such as public housing), the way in which derivative power is distributed is critical. If derivative power is con-

²⁹ Raymond E. Wolfinger and John Osgood Field, "Political Ethos and the Structure of City Government," this REVIEW, 60 (June, 1966), 306-326. Also see James Q. Wilson and Edward C. Banfield, Communication to the Editor, *op. cit.*

³⁰ Southern cities are those in Texas, Oklahoma, Kansas, Missouri, Arkansas, Alabama, Louisiana, Mississippi, Georgia, Florida, North Carolina, South Carolina, Virginia, West Virginia, Kentucky, and

Tennessee. The data are not presented because of limitation on space.

³¹ Hawley, *op. cit.*

centrated, he argues that the community should be able to act as a unit in almost any emergency; if power is widely dispersed, successful coordination leading to collective action is less assured. Hawley used participation in urban renewal programs as his measure of a collective community success, and he used the MPO ratio (the proportion of the employed civilian labor force that are managers, proprietors, or officials) as his measure of the degree of concentration of community power. He reasons that the higher the MPO ratio, the greater the dispersion of community power, and the less the successful implementation of urban renewal.

Table 2 would seem to confirm Hawley's hypothesis for the policy area of public housing. Cities with high MPO ratios are less likely to innovate in all respects than cities with low MPO ratios. This is also true for each of the four innovation measures when correlation coefficients are computed for northern and southern cities separately. The relationships in the South are somewhat attenuated, but remain statistically significant.

Other data drawn from case studies question this interpretation of the MPO ratio, however. Aiken classified 31 case studies of community power (which are among the 646 cities studied here) on a four-point scale of concentration of power ranging from "pyramidal" to "dispersed power" arrangements using qualitative judgments of the number of groups involved in major issues in the community as the measure of degree of dispersion of power.³² The results show, first, that communities with diffused power (many power groups) have somewhat higher levels of innovation and outputs, and that cities having high MPO ratios have higher concentrations of power (i.e., fewer power groups) than cities with low MPO ratios.

According to Hawley's own data, cities having low MPO ratios are more likely to have the following characteristics: mayor-council form of government, a manufacturing labor force and large manufacturing plants, low educational achievements, and low median income.³³ A persuasive argument can be made that attributes such as these are more likely to be characteristics of cities having diffused power arrangements, thus raising more questions about Hawley's interpretation of this measure.

Thus, our empirical findings are that cities with high MPO ratios have less public housing, as an extrapolation of Hawley's reasoning would suggest, but few active power centers if

the results from the 31 case studies are correct. But it should be remembered that concentration of power for Hawley referred to the distribution of systemic power while the meaning here refers to elite participation.³⁴ It is still logically possible that systemic power could be highly dispersed, yet there could be few actors or power centers active in such cities. Still, this inconsistency does raise important questions about the meaning of the concept of concentration of power and about the ways in which such apparently contradictory findings might be reconciled.

The second theory associated with the hypothesis that concentration of community power leads to greater innovation refers mainly to *citizen participation*. It has been argued by Crain and Rosenthal that the higher the level of education in a community, the higher the political participation, which in turn leads to higher conflict, producing stalemate and low innovation.³⁵ Thus, the hypothesis links a high level of educational attainment with a low degree of community innovation and output, and posits an intervening process of heightened political participation and consequent community conflict and blockage. The hypothesized relationship between the per cent of adults with a high school education and the four measures of innovation gives strong support to this hypothesis (see Table 2). These correlations are approximately the same when they are separately computed within the North and the South.

While the empirical relationship between these variables is as they predicted, some questions can be raised about the meaning of this educational variable and the intervening process. Does a high level of educational attainment in a community reflect the presence of a politically informed and active middle class? Or does it reflect merely the absence of a poor and needier population, or at least a sufficiently small one?

³² This same point can be made with respect to urban renewal decisions, as we have in "Community Structure and Innovation: The Case of Urban Renewal," *op. cit.*

³³ Crain and Rosenthal, *op. cit.* Their argument is more complex than this, however. For decisions about urban renewal and school desegregation, they found a negative relationship between level of education and success. However, they found a curvilinear relationship between educational level and success in an issue such as fluoridation. Since the public housing decision is most comparable to urban renewal, we have discussed their theory only as it applies to this kind of decision. We have not included their discussion of a curvilinear relationship between educational level and policy outcomes in which cities with the very highest educational

³² Aiken, *op. cit.*

³³ Hawley, *op. cit.*, p. 428.

that has few political resources? The correlation coefficient between the proportion of adults with four years of high school or more and the upper extremes on the education and income distribution—per cent of adults who have completed college and per cent of families with incomes of \$10,000 or more per year—are .70 and .69 respectively. The correlation coefficients between the proportion of adults with four years of high school or more and the lower extremes on the education and income distributions—per cent of adults who have completed less than five years of education and per cent of families with incomes of less than \$3,000 per year—are -.75 and -.44 respectively. The interpretation of educational level depends to a great extent on which end of the stratification scale one wants to emphasize, whether the level of poverty and poorly educated citizens or the presence of an articulate and active middle class.

In the analysis of the 31 case studies of community power it was found that cities with high educational levels had more concentrated power arrangements (i.e., fewer power groups) than those with low educational levels, although the relationship was not a strong one.³⁶ Similarly, Clark found a positive relationship between the median educational level and the degree of centralization of power (i.e., fewer elites participated in decisions about urban renewal, the election of the mayor, air pollution, and the anti-poverty program in high-education cities).³⁷ Cities with high educational levels evidently have less elite participation, although it is still possible that such cities have greater citizen participation, as Crain and Rosenthal argue. They, like we, lack direct data on the key intervening variable of participation, and, unfortunately, such data do not exist for a large sample of cities. If voting turnout can be regarded as a crude indicator, a recent study has shown that better-educated cities have *lower* voting turnout than less well educated cities.³⁸ We find, as shown in Table 2, that among the 411 cities in our study for which data on voting turnout are available, *higher* voting turnout is associated with greater innovation in public housing. While the relationships are small, it should be noted that they re-

main approximately the same when correlation coefficients are computed within northern and southern cities, despite considerable differences between the regions on voting turnout.

The same questions that can be posed about the meaning of this education variable can also be posed about the meaning of the MPO ratio because of the extremely high relationship between per cent of adults with four years of high school and the MPO ratio ($r = .65$). Both of these are also strongly related to the per cent white collar ($r = .88$ and $.77$, respectively), although it should be noted that MPO is one component of the white-collar variable. These can be regarded as measures of the degree of middle-class domination of a city, and in each case we find that middle-class cities have more centralized power arrangements (i.e., fewer active power groups and actors) and less public housing, but how do we account for this? If low centralization implies high *citizen* participation (as measured by voting turnout) or dispersed systemic power (as measured by the MPO ratio), then we find that there is less public housing in decentralized cities. If low centralization implies *elite* participation, then we find that there is less public housing in centralized cities. There appears to be an inconsistency here for which there is no readily available explanation. Our comments are not intended to imply that the well-reasoned theories of Hawley and Crain and Rosenthal are incorrect. We simply do not have the evidence to demonstrate that, and it is logically possible that all explanations are correct. Still, it is important to note the different usages of the concept concentration or centralization of power and to distinguish carefully among them. There are a sufficient number of questions about both the Hawley and Crain and Rosenthal hypotheses to argue that they constitute incomplete and less promising theoretical explanations, even though our zero-order correlation coefficients are consistent with their hypotheses. We have moved toward a different type of explanation which is discussed later in this paper.

These remarks have not discussed in sufficient detail the third aspect of the concentration of power thesis: *elite participation*. The hypothesis here is that the fewer the number of influential persons in a community (and by definition the more concentrated power is in the political system), the easier it is to innovate. Although the community power literature has not dealt directly and systematically with innovation or policy outputs, the implied hypothesis by defenders of *both* the pluralist and the reputational schools is that the more centralized the political system, the greater its capacity to act. While

levels have more success than cities with intermediate educational levels.

³⁸ Robert R. Alford and Eugene C. Lee, "Voting Turnout in American Cities," this REVIEW, 62 (September, 1963), 796-813.

Hunter³⁹ stressed the role of a few heads of large corporations and banks as the source of coordinating leadership, and Dahl⁴⁰ stressed the role of a few political and public leaders as the moving force within an "executive-centered order"—without systematic data and without presenting this general hypothesis except indirectly—both assume that a centralized community system will be more able to make decisions and to make them faster.

Dahl, for example, concludes from his study of urban renewal in New Haven that "during Lee's tenure as mayor, control over urban redevelopment became much more highly centralized in the hands of the mayor and his redevelopment team than it had been in the previous administration." This "new redevelopment coalition . . . enabled him and his collaborators in redevelopment to assume influence over local policies on redevelopment and renewal."⁴¹ And Hunter concludes that "policy decision tends to center in the actions of a relatively few men in the community."⁴² Hunter's study was neither comparative nor historical, but the clear implication of his work is that no major innovation in Atlanta could be carried out without the direct involvement of the relatively few men who constituted the power structure.

We must not make too much of the relevance of the community power literature for our present argument. Both Hunter and Dahl stress the limitations on possible actions created by existing commitments to institutional arrangements, divisions of powers, and allocation of resources. But they, as well as we, essentially restricted their discussion of community decisions to those which are well within the range of the politically feasible at any given time. Federal programs such as public housing challenge few established economic or political interests, if any, and thus do not constitute a radical innovation.

Both Hunter's and Dahl's studies focused upon single cities. Few systematic comparative studies have been done of the concentration of community power which examined the number of actors in different issues and the consequences for community innovation. Clark's study of 51 cities found that the greater the decentralization of community power as measured by the number of persons involved in decision making in

four issues (urban renewal, air pollution, poverty programs, and the selection of the mayor), the greater the number of urban renewal dollars per capita secured from the federal government. Clark concluded that more decentralized communities had higher policy outputs and advanced the hypothesis that "fragile" decisions were more susceptible to blockage.⁴³ The point that is relevant here is that decentralization (i.e., few elites participating) was associated with higher outputs. And as we have already seen, Aiken's coding of 31 case studies of community power into four levels of centralization (i.e., number of groups participating) came to the same conclusion.⁴⁴

Third, *centralization of formal political structure*: This argument has two aspects, one based on centralization of formal power, the second related to the political culture argument. In the first case, the thesis in the literature is that the more centralized the formal political structure, the more innovative in policy making it should be. The indicators of centralization are ambiguous, however, since the usual conception of "reform" government is that its structural devices—the city-manager form, nonpartisan elections at-large elections, small city councils—were intended to centralize power in the hands of a small executive and a professional manager at the same time that potential power in the hands of citizen groups was fragmented and dispersed by removing the instruments of the political party and the ward organization. On the other hand, some have argued that strong political parties were the most effective device for centralizing power. But in either case, there was agreement that administrative or political centralization should lead to greater innovation.⁴⁵

The second aspect of political structure is related to the political culture argument, because it has been argued that reform political institutions are part of the array of policies favored by groups with public-regarding values, and presumably the instruments of such values should produce consequences similar to that of sheer demographic composition.

In most respects, the predictions of innovation which would be made by either the administrative centralization or political cultural interpreta-

⁴² Hunter, *op. cit.*, p. 204.

⁴³ Clark, *op. cit.*

⁴⁴ Aiken, *op. cit.*

⁴⁵ The most recent statement of this hypothesis occurs in a study of fluoridation by Crain, Kaiz and Rosenthal, *op. cit.*, and one on poverty programs by Greenstone and Peterson, *op. cit.* The somewhat more complex argument of Crain, Kaiz, and Rosenthal will be discussed in detail below.

TABLE 3. INDICATORS OF COMMUNITY INNOVATION AND OUTPUT BY INDICATORS OF FORMAL POLITICAL STRUCTURE OF MUNICIPAL GOVERNMENT

	(N = 78)	(N = 127)	(N = 41)	(N = 126)	(N = 274)	(N = 646)
	Com- mission	Partisan Mayor Council	Partisan Council- Manager	Non- partisan Mayor- Council	Non- partisan Council- Manager	All Cities
Presence of innovation in any public housing program since 1933	76%	73%	71%	61%	49%	60%
Speed of innovation: Number of years after 1933 before the city began construction on its first public housing project	19.2	21.1	24.2	23.6	24.9	23.2
Speed of innovation: Number of years it took after state enabling legislation was present	12.4	17.9	21.2	19.7	19.8	18.6
Level of output: Number of public housing units constructed per 100,000 population	1,080	751	684	645	520	668
Level of output: Number of public housing units constructed per 100,000 population (natural logarithm)	5.36	4.94	4.68	4.07	3.30	4.11

tation of differences of formal political structure would be the same. The prediction is ambiguous only in the case of the form of election. If nonpartisan elections are considered to reflect decentralization and high citizen participation, then, according to this line of reasoning, they should be associated with low innovation. But if they are regarded as instruments of groups with public-regarding values and as political mechanisms which reduce citizen participation, then nonpartisan elections should be associated with high innovation.

Table 2 displays the correlations between four aspects of the formal political structure of American cities and four measures of innovation in public housing. The centralization argument is supported by none of these indicators, unless one wishes to accept the argument that partisan elections lead to administrative centralization, less citizen participation, and therefore higher levels of innovation. The data support only the latter proposition. Cities with city-manager governments, nonpartisan elections, at-large elections, and small city councils are either less likely to innovate in this public policy area than cities with mayor-council governments, partisan elections, ward elections, and large city councils, or there is no relationship. Again, the same pattern is found in both northern and southern cities. Some significant relationships drop to insignificance,

especially in the South, and the one reversal (per cent elected at large and the second speed measure in the South) is not statistically significant. As a corollary, the political culture argument also fails, since the reform institutions are not more innovative than the nonreform institutions.

In Table 3 we examine the degree of innovation among each of five types of city government, in order to test the more complex hypothesis of Crain, Katz and Rosenthal that cities with both low political participation and high executive centralization (which would be maximized by the city-manager form of government and partisan elections) should have higher rates of innovation, although their rationale for such hypotheses is too complex to present here.⁴⁶ They found that administrative adoption of fluoridation was greatest in cities with city-manager government, followed by those with partisan mayor-council, nonpartisan mayor-council, and lowest in those with commission form of government. We find that innovation in public housing is greatest in cities with the commission form of government; such cities had the *lowest* rate of innovation (administrative adoption) in fluoridation, however. Like the fluoridation findings,

⁴⁶ Crain, Katz, and Rosenthal, *op. cit.*, pp. 177-205.

innovation in public housing (as well as in urban renewal and the war on poverty) is greater in partisan mayor-council cities than in the non-partisan mayor-council type. But unlike the findings for fluoridation, we find that nonpartisan council-manager cities have the least innovation in public housing; administrative adoption of fluoridation was found to be greatest in council-manager cities.

As Crain, Katz, and Rosenthal suggest, some community systems can make certain kinds of innovations with dispatch while other cities can make other types of decisions only with great difficulty. Evidently, the contrasting findings about innovation in public housing and fluoridation are one example of their conclusion. Although there are some findings in these data about public housing to support in part the predictions of Crain, Katz, and Rosenthal, the inconsistencies in findings as well as the low zero-order relationships of political structure with innovation, at least in comparison to some other relationships with innovation, lead us to conclude that such a theory is perhaps not the most appropriate for an explanation of innovation in public housing.

Fourth, *community differentiation and continuity*: Larger and older cities have both greater structural differentiation and greater continuity. In the literature on community decision making, it has been argued that larger and older cities are both more innovative and less innovative in two different studies. Each of these studies has focused on innovations in different issues and provided differing and contradictory theoretical explanations. Thomas Dye, studying desegregation in 55 northern and southern cities, found that larger and older cities tended to have more segregation than smaller and younger ones.⁴⁷ He argued that larger cities were likely to be more bureaucratic and that "... large bureaucracies have many built-in mechanisms to resist policy innovations." Older cities were immobilized because "... over time persons and organizations adjust themselves to circumstances as they find them." And he did find greater segregation in older and larger cities, at least in the North, as the hypothesis would suggest.

On the other hand, a recent article dealing with public health organizations in 93 cities located in four midwestern states and Ontario by Lawrence Mohr found that public health organizations in larger cities were more innovative. He explained this by arguing that a community decision organization such as a public

health organization was larger in big cities, had more resources available, and, in such circumstances, innovative leadership was more likely to be effective.⁴⁸

The interpretations of the meaning of the age and size of cities are thus contradictory. On the one hand, it has been argued that older and larger cities are more rigid, more set in their ways, more complex and differentiated and, therefore, more incapable of action. On the other, such cities should be more adaptable, more experienced, and more flexible.

The data in Table 2 show that older and larger cities are in fact considerably more likely than younger and smaller cities to have innovated in public housing. When correlation coefficients are computed separately for northern and southern cities, the relationships differ only slightly from those reported in Table 2. Whether or not age and size are merely a reflection of a high level of structural degradation of the housing and building stock which cannot readily be replaced by the private market for low-rent housing is an important question for the interpretation of these relationships and will be taken up later.

Fifth, *community integration*: The argument here is that more highly integrated communities, i.e., those with highly developed networks of communication and contact among social groups, should suffer less from paralyzing conflict in the case of a new issue requiring decision, because on the one hand, channels of communication to work out compromises exist, and, on the other hand, isolated factions standing fast on their own position would not be present.⁴⁹

The indicators of community integration used by Pinard are quite diverse, and include several already mentioned here under other headings. Positive fluoridation decisions were hypothesized to be associated with low ethnicity, many middle-class persons, low voting turnout, small population size, low unemployment, and low in-migration. As already seen, three of these—low ethnicity, middle-class composition, and small size—are associated with less innovation in public housing, not more as would be predicted by the integration theory.⁵⁰ In the case of unem-

⁴⁸ Mohr, *op. cit.*

⁴⁹ Pinard, *op. cit.* James Coleman, *op. cit.*, has provided the theoretical argument which he illustrated by case studies, and Pinard has applied the theory in his study of fluoridation decisions.

⁵⁰ While we cannot summarize Pinard's complex argument here, it may be noted that his data do not support his hypothesis about the effects of middle-class composition. Middle-class cities are less likely to decide to fluoridate their water than

⁴⁷ Thomas R. Dye, "Urban School Segregation: A Comparative Analysis," *Urban Affairs Quarterly*, 4 (December, 1968), 141-165.

ployment and in-migration, the thesis is that high unemployment levels will produce disintegration of community life by reducing attachments to community institutions and increasing conflict. High levels of in-migration will reduce integration by disrupting long-standing networks of communication and interchange among groups and organizations in a community. Contrary to expectation, low unemployment is associated with less innovation in public housing, not more. The only indicator among these six that works in the predicted direction is the degree of in-migration. Cities with high levels of in-migration (which are hypothesized to be less well-integrated) do have less success in public housing. When correlation coefficients are computed for northern and southern cities separately, the relationships for the two additional variables discussed here are hardly changed.

To summarize, few of the hypothesized relationships drawn from the literature discussed here are borne out completely, and we have raised some questions about the theoretical interpretation of those that were as predicted. The main findings thus far are that older and larger cities, those with lower levels of education and income, fewer managers and officials, higher voting turnout and Democratic voting, a lower degree of in-migration, and higher unemployment levels have participated more in public housing, entered it faster, and have higher performance levels. The question which these results immediately raises is whether or not public housing is simply a response to poor housing stock and higher levels of need and dependency.

The factor of community need might be regarded either as an independent variable or as a control variable, depending on the specific problem in which one was interested. If the need of the community for welfare programs—as measured by unemployment, poverty, low education, etc.—accounted for all or most of the statistical variation between communities in the degree and level of a particular type of innovation, this would be an extremely important finding, because it would show that need, whether manifest in political demands by the needy or in autonomous responses to need by political leaders regardless of demands, was the major source of in-

working-class cities, contrary to the integration hypothesis. Pinard then argues that a large middle-class city is more likely to have a divided elite, thus decentralized power arrangements, more conflict, and, therefore, less innovation. Although his postulates about the meaning of his indicators are inconsistent with ours, his data are consistent, at least with respect to the effect of middle-class composition.

novation and policy outputs, regardless of the values of key groups, the concentration of power, or the integration of the community.

Table 2 thus includes some additional measures of the poverty and housing conditions among these 646 cities. Cities with more dilapidated housing in 1950, many poor families, many poorly educated adults, more high school dropouts, and many nonwhites were indeed more likely to have entered the public housing program, entered it faster, and have higher performance levels as reflected by the number of housing units per 100,000 population. These relationships, as with most of those previously discussed, are approximately the same when computed separately for northern and southern cities.

Given these strong and consistent relationships between city size and these need measures and innovation in public housing, we may pose the question whether or not many of the previously discussed relationships, regardless of the concepts they were alleged to represent, are not simply functions of a high degree of community need for public housing. In an attempt to answer this question, we first computed a series of partial correlations for most of the variables in Table 2, controlling for level of dilapidated housing and city size. As shown in Table 4, the relationships between the variables that were strongly related to innovation measures in Table 2 still have relatively strong relationships with the innovation measures even when the effect of city size and the amount of dilapidated housing are removed statistically. Step-wise regression analyses which introduced the need variables first also supported this finding.

Clearly factors other than simply reflections of a needy population are efficient predictors of community innovation, and clearly the two measures of centralization of power that were consistent with predictions—per cent of the adult population with four years of high school or more and MPO ratio—do not hold up when other variables are controlled.

But to point out the consistencies in these empirical relationships does not solve the problem of understanding why and how some communities enter the public housing program and others do not. The mind is not set at rest by discovering that poorer, more needy cities have greater participation in this federal program or that older, larger, more heterogeneous cities are also more innovative. In the first place the relationships are not unusually strong. In the second place, these "ecological" correlates do not tell us anything about the intervening processes which enabled some cities to mobilize local resources sufficiently to provide relatively high levels of

TABLE 4. PARTIAL CORRELATIONS BETWEEN COMMUNITY CHARACTERISTICS AND SPEED OF INNOVATION (AFTER ENABLING LEGISLATION) AND LEVEL OF OUTPUT, CONTROLLING FOR SIZE OF COMMUNITY AND PER CENT OF HOUSING DILAPIDATED IN 1950

	Speed of Innovation in Housing (After Enabling Legislation)	Log N Number of Housing Units per 100,000 Population

public housing for its needy citizens while others did not. What do these and other available data tell us about the political and organizational factors and processes that enabled some cities to mobilize effectively for this particular structural and policy innovation, and others not? Both a reinterpretation of the data already presented and a more complex analysis of them may cast some light on this question.

Structural Differentiation and Community Innovation

Cities that appear to be most heterogeneous,

differentiated, and decentralized—as indicated by ethnicity, a large working class, nonwhite composition, size, and the qualitative data on centralization (i.e., degree of elite participation) in the works of Clark and Aiken—are most likely to have innovated in public housing. An alternative theory of community innovation—at least for innovation in programs such as urban renewal, low-rent housing, the war on poverty, and model cities—must begin with the proposition that successful innovation in such programs is more frequently attained in fragmented, differentiated and heterogeneous community systems. The demographic data just described offer only indirect support for this proposition. More important are the data from Aiken and Clark already cited which show that the more groups and actors participating in current decisions, the higher is the level of innovation and outputs.

Several other bodies of data can be used to support this proposition, however. The sheer size of a city is only a crude indicator of the degree of structural differentiation and organizational complexity of a community. A more direct way of measuring organizational complexity would be a count of the number of organizations of various types which play some role in community life, i.e., the richness of organizational life.⁵¹ We have data on the extensity of three types of organizations—manufacturing firms, banks, and trade unions—although for only a sub-sample of cities in each case. Unfortunately, we lack data on other more crucial types of organizations such as political parties, voluntary associations, or the local government.

Not only is the sheer number of organizations important, but also the number having sufficient resources to affect critically the course of community innovation. For this reason we have chosen the number of manufacturing establishments with 100 or more employees and the number of independent banks with assets of at least ten million dollars as our measures of organizational complexity and differentiation. Unfortunately, the unionization data cannot be treated in exactly the same way. But because larger firms are more likely to be unionized and because the data include all establishments in which a majority of the plant workers are unionized, we believe that this measure too is an appropriate indicator of the organizational complexity of a community.

The data relating structural differentiation and community innovation are presented in Table 5. Because the level and character of union-

⁵¹ Cf. Arthur L. Stinchcombe, "Social Structure and Organizations," in James G. March (ed.), *Handbook of Organizations* (Chicago: Rand McNally, 1965), pp. 142-193.

Source: Manufacturing and banking data are available for the 217 nonsuburban cities in the size range 25,000 to 250,000 population which had 20 per cent or more of their labor force in manufacturing in 1960. The unionization of manufacturing establishments is available for 84 metropolitan areas, which provide an estimate of the trade union level of 112 cities within them. See Michael Aiken, "Economic Concentration and Community Innovation," unpublished manuscript, 1969, for details on the construction of the measures. The banking data were taken from *Polk's Bank Directory* (Nashville: R. L. Polk and Co., March, 1966). The data on unions are drawn from Bulletin No. 1465-86, Bureau of Labor Statistics, U. S. Department of Labor, Washington, D. C., October, 1966, titled *Wages and Related Benefits: Part I, 84 Metropolitan Areas, 1965-66*. The measure is the approximate per cent of all plant workers employed in establishments in which a union contract covered a majority of workers during the period July, 1964, to June, 1966. We have assigned the degree of unionization in the SMSA to the urban place, as the best estimate we have of the unionization of the city itself.

*** $P < .001$

ization can be presumed to be different in the North and the South, the data for that variable are presented by region. These results are consistent with our expectations. The cities with more manufacturing establishments of size 100 or more, with more independent banks with assets of ten million dollars or more, and with more unionized plants are most likely to have innovated in all respects.

These measures of structural differentiation can be regarded as ways of more precisely spelling out what it means to be a large city, as far as capacity to innovate is concerned. Large cities have a greater diversity of social organizations, and apparently one consequence is greater innovation.

This deceptively simple and obvious statement can be generalized, but before doing so, we should

point out that this whole line of interpretation of the data in Table 5 is inconsistent with most of the previously discussed theories. Among the 112 cities for which unionization data are available, highly unionized cities are more likely to have fewer working-class persons ($r = -.50$ with the MPO ratio), to have fewer well-educated citizens ($r = -.24$ with per cent high school graduates), to have higher political participation ($r = .37$ with the per cent of registrants voting), and to be in more Democratic counties ($r = .27$ with the per cent Democratic vote in 1960). According to the ethos theory, such cities should be more private-regarding, and therefore have less public housing. According to Hawley's argument, they should be more decentralized and therefore should have less public housing. According to the integration argument, they should

have more conflict, and therefore less public housing. None of these is the case.

The manufacturing and banking data also contradict the centralization argument, since we would expect that a power structure of executives and bankers should be more homogeneous in a context of fewer and larger firms. Instead, the greater the number of such organizations, the greater the innovation and the outputs.

What these disparate findings suggest is that the independent variables explaining community innovation must be disaggregated. The concepts normally used to explain community behavior may reify the diversity of community structures which sponsor and carry through actions. Global concepts such as centralization, integration, or ethos may hinder the comparative analysis of urban political and governmental processes. Concepts recognizing the fundamental diversity and differentiation of cities should be incorporated into the basic analytic framework.

Unfortunately, the data we have reported here may efficiently predict community innovation in public housing (regression analyses of 17 of the variables shown in Table 2 explain 30 to 40 per cent of the variance in the four innovation measures), but they cannot directly test our ideas about the processes which lead to community innovation. Before turning to a brief alternative theoretical sketch, we believe that some comments on the relation of theory to methodology in this area will be useful.

III. SOME METHODOLOGICAL CONSIDERATIONS

Quantitative ecological analysis raises certain methodological considerations related to the *indicators* used, the *unit of analysis*, the difficulties of analyzing complex *causal processes* which are essentially historical in character and national in scope, and, lastly, the use of the data as a *sampling frame*. We shall use our previous substantive findings as examples illustrating these problems, also discussed elsewhere.⁵²

The difficulty of obtaining satisfactory empirical *indicators* of theoretical variables such as centralization, differentiation, complexity and the like is primarily due to two problems: lack of easily and cheaply available data and lack of resources to obtain better data. The Census Bureau and agencies such as the International City Management Association which collect the only easily quantifiable data do not obtain those data which may be most useful for purposes of causal explanation, and better data are extremely time-consuming and costly to collect. It is for this

reason that students of urban decision making have emphasized case studies, which provide richer and more complex information about the detailed processes and events involved. But if one begins with the assumption that comparative quantitative studies provide an invaluable framework of basic findings and parameters, one must attempt to make the most careful and logical inferences from the crude ecological data that are available.

Our previous discussion of the problems of interpreting the meaning of the MPO ratio, the level of education, and the form of government has illustrated concretely the problem of selection and interpretation of indicators. The general implication which we draw is that single indicators of complex theoretical variables are not sufficient, *if* the indicator is several inferential steps from the phenomenon of real concern. Multiple indicators provide simultaneously a check on the consistency of the patterns of relationships presumed to be found with other variables and some assurance that several dimensions of meaning of the theoretical variable are being tapped. This principle holds for both independent and dependent variables. In this article, for example, we have analyzed four different indicators of the dependent variable. Sensitivity to the problem of the gap between indicators and theoretical variables will also avoid easy resort to the statement: "This variable is operationalized as follows. . . ."

The problem of the *unit of analysis* arises essentially because of ambiguity about the location of causal agency for the processes represented by the data available. Whether or not the observed phenomena of innovative outputs can be best explained by the actions of community organizations and officials, by the operations of cultural values, by ecological and economic forces at the level of the urbanized area, or by political configurations and traditions at the state or regional level, is not obvious from the data themselves. To some extent this problem can be regarded as one solved by seeing the operation of causal forces in a way which parallels the "nesting" of units of analysis within each other: decisions, men, organizations, urban areas, states, regions, nations. Organizations shape and select the men who make the decisions; urban areas grow in ways which shape and select the organizations within them; states and regions develop in ways which shape the urban areas within them. But this way of seeing the units of analysis merely redefines the problem in a possibly clarifying way; it does not solve the problem of selecting the appropriate unit of analysis or of interpreting the resulting data.

⁵² Mattei Dogan and Stein Rokkan (eds.), *Quantitative Ecological Analysis in the Social Sciences* (Cambridge: The MIT Press, 1969).

Generally, the reasoning about our data leads us to an eclectic approach to this problem, one which does not rule out *a priori* the operation of causal forces at any level of social or political organization. We suggest in our theoretical section following that many of the properties usually assigned to the community as a whole can be reduced to properties of organizations and interorganizational relationships, which might seem to opt for a smaller, more "micro" unit of analysis. But we do not offer this as a methodological principle. Rather, it seems to us that the analyst should not prematurely assume, just because his *data* refer to cities, for example, that the theoretical concepts appropriate for an adequate explanation must also be defined in terms of the city as the causal agency. The basic causal forces may be at a larger, more macro level (the state, region, or nation as a whole), or at a more micro level (organizations, individuals), or perhaps at all three levels.

This point brings us to a last and related problem: the location of complex *causal processes* which are essentially historical in character. Most of the variables which we have found to be related to innovation are closely related to the region in which a city is located. Cities in the Northeast tend to be larger, older, have more out-migration and more persons of foreign stock. If three dummy variables representing region are used in a regression equation, they alone explain approximately eight per cent of the variance in the innovation measures. The empirical relationships are clear; the way to handle them methodologically in order to make a theoretical point is not at all clear.

Cities differ along many dimensions which are related to the stage of industrialization during which they grew, the period in which certain ethnic or racial groups were migrating to specific regions, and the period of time in which certain innovations of structure and function were being diffused and adopted. Such complex historical processes cannot be isolated into separate "factors" by any conceivable multivariate statistical procedure. If this is true for American cities, the same methodological problem will appear even more sharply once systematic comparisons of cities are attempted on a cross-national basis. Again, we can only raise some of the problems and issues, not solve them.

The statistical "effect" of regions (or international differences, which are logically similar) can be handled in two ways, if one wishes to approach the problem quantitatively. The regional units can be broken into two categories and treated as "dummy" (binary) variables for the purpose of correlations and regression analysis. The other way is that of contextual analysis

which we have followed in this paper: repeating the correlational analysis separately within different regions. This procedure has the advantage—if it works, as it did in the data we report—of greatly strengthening the tests of hypotheses if the same patterns are found in different regions, or if deviations can be readily explained. If the procedure does not work—if, that is, relationships become wild and random (at least in terms of any theoretical framework available at the moment)—one cannot be sure whether or not one has artificially destroyed real relationships by the "control" for region via the contextual analysis procedure. This point deserves a bit of emphasis with an example.

We know that the proportion of persons who are of foreign stock differs greatly from region to region in the United States, being highest in the Northeast and lowest in the South and Far West. By separating the nation's cities into four regions, and examining correlations within each, we are tacitly assuming that the meaning of the "ethnicity" variable is the same from region to region. Yet if the mean proportion of persons of foreign stock is sharply different from region to region, we are not really dealing with the same variable at all since a high of 15 per cent in the South may be equated with a high of 60 per cent in the Northeast. Failure to find similar relationships of this variable with others may be an artifact of the procedure employed. On the other hand, if we use the "dummy" variable procedure in a regression analysis, we are ignoring the problems of the temporal causal ordering of the variables by throwing into one matrix variables causally prior to others in the same matrix. Not only that, but region is by definition a complex summary or proxy variable which "stands for" a multiplicity of processes of migration, age, ethnic composition, and the like. If these variables are also in the regression equation, it is very difficult to interpret the outcome. The severe problems of multicollinearity which occurred whenever we attempted to use region as a dummy variable underlines this difficulty.⁵³

Lastly, the data and findings reported here could be used as a *sampling frame* for a comparative community study in which the intervening process of community decision making is the key focus of the research. In such a research enterprise, the data and findings in the present study

⁵³ See Robert R. Alford, "A Critical Evaluation of the Principles of City Classification," in Brian Berry (ed.), *Classification of Cities: New Methods and Alternative Uses*, forthcoming, for an elaboration of these methodological points with special reference to the factor analyses of city characteristics.

could be used to select a sample that is not only characteristic of given region or size categories, but also a sample of cities having high and low structural potential for outputs as well as high and low actual performance. The study of the deviant cases could be particularly fruitful.

Another procedure that could be used in sampling would be based on the calculation of residuals in regression analysis. Within a given size or region category, for example, at least three types of cities could be identified: a) "over-performers," b) "under-performers," and c) "normal performers," at least as predicted by a set of key independent variables in a regression analysis. These are only two possible ways of establishing a sampling frame. The data and findings could be used in designing comparative research projects on American communities, and might also be fruitfully applied to research on communities in other societies.

IV. CONCLUSIONS

Our tentative alternative approach is that community innovation of the kind examined here must involve a two-level analysis. First, an explication of the kinds of community attributes which create the conditions for the development of certain types, numbers, and qualities of organizations that are critical for innovations for the type under discussion here, and, second, the kinds of attributes of organizations and their environments—or organization sets to use the term of William Evan⁵⁴—that facilitate the speed of implementation and subsequent performance of the innovation. To some extent these levels are the same thing examined from two points of view, but we believe that the concepts may be usefully distinguished.⁵⁵

With respect to the first, our findings point to three kinds of concepts as the most important: the quality and stability of interorganizational ties, the accumulation of experience and information in a community system (continuity), and structural differentiation. Interorganizational networks are conceived as properties of community systems that are developed historically through the experience of organizational units and their leaders with each other. If the population of a community is relatively stable, these interorganizational networks are not likely to be disrupted by the continuous influx of new citi-

zens and organizations, and thus there is the greater potential for increasing their capacity for coordination over time.

The degree of historical continuity in a community structure—especially as it affects inter-organizational networks—may also influence innovation. Presumably older cities have had a longer time for existing organizations to have worked out patterns of interactions, alliances, factions, or coalitions. In such communities the state of knowledge in the community system about the orientations, needs, and probable reactions to varying proposals for community action is likely to be quite high, thus increasing the probability of developing a sufficiently high level of coordination in order to implement successfully a community innovation.

The degree of structural differentiation and complexity of a community may also influence innovation for two reasons. First, larger cities are likely to have more organizations devoted to specific kinds of decision areas—i.e., more likely to have a redevelopment agency, a housing agency, a community action agency, a city development agency for model cities, welfare councils, and other community decision organizations. Such organizations are likely to have larger, more specialized, and more professionalized staffs to provide the technical, administrative, and political knowledge required to innovate successfully not only within their organizations, but also in those areas which require activating interorganizational relationships and establishing critical coalitions. Secondly, it is precisely in the larger, more structurally differentiated communities that coalitions that can implement an innovation will be easiest to establish. If we assume that all organizational units in a community do not have to be mobilized in a decision such as public housing, but rather that only a limited number of organizational units can suffice to bring about a successful innovation, then it follows that in large, highly differentiated communities a lower proportion of organizations will participate in such decisions, and that there will be wider latitude in selecting organizations for these critical coalitions. The more highly differentiated or specialized a community system, the higher the proportion of decisions that are likely to be made by subsystems and the less likely the entire system will be activated.

We thus suggest that these three properties of communities—structural differentiation, the accumulation of experience and information, and the stability and extensiveness of interorganizational networks—may contribute to the capacity of a community to generate the kinds of social resources necessary for innovation. While we

⁵⁴ William M. Evan, "The Organization-Set: Toward a Theory of Interorganization Relations," in James D. Thompson (ed.), *Approaches to Organizational Design* (Pittsburgh: The University of Pittsburgh Press, 1966).

⁵⁵ The research by Mohr, *op. cit.*, is suggestive of the appropriateness of this two-level approach.

have no direct measures of these properties and while these suggestions are only inferential, such imagery about the process of community innovation does appear to be consistent with our findings about the characteristics of communities that have been most successful in innovating in public housing.⁵⁶

In our larger study of community innovation and decision making, similar relationships have been found for participation in other federal programs such as urban renewal, the war on poverty, and model cities. What is common to each of these programs is first, resources come from outside the community, second, each of these programs has a sponsor—a community decision organization,⁵⁷ and, third, the decision to innovate is made in most cases by representative agencies—the city council, the community deci-

sion organization, and other representational units. Many of the decisions examined in the previous studies—fluoridation, desegregation, and school bond and other referenda—involved few external resources, did not usually have the sponsorship and legitimization by a community decision organization, and were characterized by a high degree of citizen participation. Such factors are likely to be critical in determining whether one theory or another best explains different policy outcomes. It may be that the centralization or integration theories, if appropriately modified, can best explain policy outcomes for issues with a high potential for citizen participation, but for issues which are more likely to be insulated from popular participation—such as public housing or urban renewal—the model alluded to here, which conceives of a community subsystem as the key unit of analysis, which considers organizations as the key actors, and which views their interrelationships and degree of coordination as critical, may be a more appropriate model.⁵⁸

⁵⁶ See Aiken and Alford, *American Sociological Review*, *op. cit.*, for a more extended theoretical statement.

⁵⁷ See Roland L. Warren, "Interaction of Community Decision Organizations: Some Basic Concepts and Needed Research," *Social Services Review*, 41 (September, 1967), 261-270; and "The Interorganizational Field as a Focus for Investigation," *Administrative Science Quarterly*, 12 (December, 1967), 396-419, for a discussion of the meaning of the concept.

⁵⁸ See Paul E. Mott, "Configurations of Power," in Michael Aiken and Paul E. Mott (eds.), *The Structure of Community Power: An Anthology* (New York: Random House, 1970), for one example of this approach.

A THEORY OF PROFESSIONALIZATION IN POLITICS*

GORDON S. BLACK

University of Rochester

Professionalization, in customary usage, refers to the assimilation of the standards and values prevalent in a given profession. Every profession, including politics, tends to have some set or sets of values that are widely held and which define what it means to be a "professional" within that field. These values are important because they affect the likelihood that the individual will achieve success in his profession. If the values are widely held, those that deviate from them are likely to be sanctioned by their colleagues, and people who fail to maintain the minimal standards of their profession are not likely to obtain professional advancement. Those who do behave according to the dominant values of their profession, however, are likely to be accorded the status of "professional" in the eyes of their colleagues, and that designation will contribute to the success of their careers.

In the profession of politics, as in other professions, there is seldom one set of standards and values that prevails in all places at all times. These normative elements are likely to vary from political system to political system, to vary within a political system, and to vary within the profession of politics over time. In a highly centralized local political organization, for example, the achievement and maintenance of a position is likely to depend upon such values as deference and loyalty to the leaders of the political hierarchy.

In a more decentralized political system, however, a different set of professional standards is likely to be predominant. In the "pluralistic" political system, the politician is a principal broker in the process through which collective decisions are made. The man who is able to develop successful coalitions and who can work out acceptable compromises is critical to the decisional process where interest conflict abounds. Robert A. Dahl and Charles E. Lindblom have described the prevalence of such individuals in the political process of the United States:

... social pluralism facilitates the rise of political leaders whose main skill is negotiating settlements among conflicting social organizations. Thus the

whole cast of the political elites is modified by pluralism; the fanatic, the Messianic type, the leader whose aim is to consolidate the supremacy of some small group tend to trip themselves up on the barrier of groups and group loyalties. The Federalists, concerned with maintaining the domination of eastern financial and commercial interests, were unable to compete with the Jefferson alliance; they died out as a party. All important politicians have been excellent negotiators of group alliances, from Jefferson and Jackson to Roosevelt and Truman.¹

Dahl and Lindblom point to what may be the most critical of the political skills required for success in American politics, a skill at bargaining, negotiation, and compromise. Explicit bargaining pervades the entirety of the political process, from the development of electoral alliances to the formation of legislative coalitions, and at the center of these processes stands the politician. To be successful, the politician must first forge a winning coalition from the kaleidoscopic variety of interests present in most constituencies. But it does not end there. The ability to bargain also determines to some extent the success of the representative in his legislature, whether at the Federal, state, or local levels of government. The ideologue who is unwilling to bargain or the "citizen-politician" who is above such behavior are not likely to be sought out for alliances.²

Although there are undoubtedly many other skills required of the successful politician, the ability and willingness to bargain would appear to be a necessary requirement for success in politics in the pluralistic political system. But the ability to bargain presumes as well that the politician has a positive view toward the processes of bargaining and negotiation. One feature of American politics has been a widespread distrust

¹ Robert A. Dahl and Charles E. Lindblom, *Politics, Economics, and Welfare* (New York: Harper and Row, 1953), p. 304.

² For a more detailed analysis of the attitudes and orientations of "citizen-politicians," see Kenneth Prewitt, *The Recruitment of Political Leaders: A Study of Citizen-Politicians* (Indianapolis, Ind.: Bobbs-Merrill, 1970). This study and the Prewitt study utilize data from the same source; the City Council Research Project, directed by Heinz Eulau.

* The larger project of which this analysis is a part, the City Council Research Project, is sponsored by the Institute of Political Studies, Stanford University, and is supported by the National Science Foundation under grants GS 496 and GS 1898.

of the politician, a distrust that probably stems in part from the particular requirements of the political role; for example the requirement that the politician bargain with the diverse groups and individuals around him.³ For some reason, "bargaining" seems to be viewed as slightly "unethical" to many people, particularly those segments of the population that have accepted the grand myth of the Progressive Era that in every conflict situation there exists a "right" decision.⁴

✓ I. MOTIVATIONS FOR ENTERING THE POLITICAL ARENA

If there does exist a widely held antagonism toward "politicians" and toward "bargaining," one wonders how it is that some people develop skills and values congruent with the requirements of politics. Do they enter into politics because they are skilled at bargaining and compromise or do they develop these skills after they enter the political arena? And what accounts for the variations in norms and values among those active in politics? Clearly not all politicians are

equally skilled at bargaining; not all politicians are even favorably disposed toward bargaining. Why is it that some individuals seem to learn the norms, values, and attitudes of the pluralistic political process more easily than others?

One answer to these questions may come from an understanding of the motivations of the men who enter the political arena. Some men appear to seek offices in order to enhance their nonpolitical careers, others may enter politics because of a sense of civic obligation, while still others may not have sought their office at all—they may have been thrust into it by their friends. These and many other motivations are common in politics, but they are not the kinds of motivation that one would associate with those who seek political careers.⁵

This study is concerned with one type of motivation that may be related to the socialization of potential politicians; the desire for political advancement. Although many people enter politics in order to enhance their nonpolitical careers, other individuals seek success through politics where success is measured in terms of political advancement. According to Joseph A. Schlesinger:

The central assumption of ambition theory is that a politician's behavior is a response to his office goals. Or, to put it another way, the politician as office seeker engages in political acts and makes decisions appropriate to gaining office.⁶

³ Dahl and Lindblom, *op. cit.*, 333-334. William C. Mitchell, "The Ambivalent Social Status of the American Politician," *Western Political Quarterly*, 12 (June, 1959), 683-698. Donald E. Stokes, "Popular Evaluations of Government: An Empirical Assessment," in Harlan Cleveland and Harold D. Lasswell (eds.), *Ethics and Bigness* (New York: Harper and Row, 1962).

⁴ The ideology of the "municipal reform movement" is an important component in local politics. The thrust of the arguments was for "good government," the "public interest," and a kind of Burkean politician who could stand above the conflict and who would reach the "right solution" to a problem rather than pandering to "selfish interests." These reforms were to come about through the adoption of such institutional changes as at-large elections, city manager plans, and nonpartisanship. The importance here is that the ideology of the municipal reform movement specifically rejected the "pluralist" view of the decisional process; and this point of view has been extremely popular in California where this study was conducted. This is reflected in the fact that all of the cities in this study operate under nonpartisanship, nearly all have at-large elections, and most have either city managers or city administrators. For a review of the history of the municipal reform movement, see Samuel P. Hays, "The Politics of Reform in Municipal Government in the Progressive Era," *Pacific Northwest Quarterly*, LV (October, 1964), 157-169. On the Progressive Movement in California, see George E. Mowry, *The California Progressives* (Berkeley and Los Angeles, 1951), pp. 86-104.

⁵ One classic study of political motivation is Max Weber's "Politics as a Vocation." He distinguishes between the men who are involved in politics on a marginal basis, as an avocation, and the men who either "live for" or "live off" politics, those whose politics are a vocation or a "calling." *From Max Weber: Essays in Sociology*, H. H. Gerth and C. Wright Mills, trans. and eds. (New York: Oxford University Press, 1958), pp. 77-128. In addition to Weber's work, this study relies heavily on three recent studies of political motivation: James D. Barber, *The Lawmakers: Recruitment and Adaptation to Legislative Life* (New Haven, Conn.: Yale University Press, 1965); Joseph A. Schlesinger, *Ambition and Politics: Political Careers in the United States* (Chicago: Rand McNally, 1966); and James Q. Wilson, *The Amateur Democrat: Club Politics in Three Cities* (Chicago: The University of Chicago Press, 1962).

⁶ Schlesinger, *ibid.*, 6. Wilson distinguishes between "amateurs" and "professionals" with the same factor of ambition; the office goals of the individual. He argues that: "The professional, for whom politics primarily has extrinsic rewards, is preoccupied with maintaining his position in party

This motivation, the desire for political advancement, should be related to an individual's commitment to politics in general, to his willingness to assume the risks and to pay the costs of furthering his career, and perhaps, as we shall explore in this study, to the extent to which he internalizes norms and values congruent with his political aspirations. The decision to seek political advancement rests on the political ambitions of the individual; and although it may be valuable to know what forces or experiences in the past of the individual produce political ambition, we suggest that the presence or absence of ambition itself is the critical intervening factor between an individual's political past and his political future and between his initial political values and those of the professional politician.

Two Levels of Political Commitment

Although the arguments presented here are not restricted to any single set of political officeholders, the data are based on a study of the city councilmen of the San Francisco Bay Area.⁷ As part of that study, 435 city councilmen were interviewed from eighty-seven cities. The interview was quite lengthy and included both open and closed questions. The tables in this paper employ questions from this interview along with some additional data on the cities themselves. *It is important to remember that these respondents all were officeholders at the time of the interview.*

The decisions that "potential politicians" make reflect their level of commitment to politics relative to other alternatives. Politics is, more than many other pursuits, a risky venture, particularly for the officeholder. Although the severity of the risk is different for different politicians, the fact of political defeat is a fact that many aspiring politicians are forced to live with continuously. Even if one has been relatively successful for a time, many budding careers have been ended with a single defeat.

For those individuals who hold office, it is useful to distinguish between two different levels of political commitment; commitment to the position the individual currently holds (in this case, the office of councilman) and the commitment

to seek other political or governmental positions. The former will be referred to as *positional commitment* and it reflects the value the officeholder places on the achievement and retention of the position he currently holds. The latter will be referred to as *progressive commitment* and it reflects the generalized aspiration of the officeholder for other political or governmental offices.⁸

These two types of political commitment need not be highly correlated; that is to say, those who are progressively committed to politics need not necessarily be high on positional commitment. With regard to the case at hand, a councilman may have run for the council, not because he was particularly concerned with local politics, but because he wished to use the council as a springboard for other political offices. Likewise, a councilman who places a high value on his job as a councilman may see that as the limit of his involvement in politics.

One method of measuring the commitment of councilmen to their office and to the achievement of other offices is simply to ask them about their commitment, i.e., about the value they place on these offices. A second measure of an individual's commitment to a given alternative (or career) is the extent to which the individual is willing to invest in that alternative relative to other alternatives. Every position in a prospective career has a set of investment costs attached to it. These costs might include the fulfillment of a skill requirement through prolonged education, the cost of expensive equipment, or other types of investments. The common denominator of all investments is that they entail some element of risk; and this risk is the cost that will be sustained if the individual fails to achieve benefits commensurate with his investment.

Although it is impossible to aggregate all the investment costs for the individual, we do have two factors which would seem to be related in a rough fashion to the relative investments that these councilmen have made in politics. These are the size of the city and the extent of the competition for office in the city. City size is important for two reasons: the larger the city, the larger will be the electorate to which the councilman must appeal and the more costly in general will be his campaign. Also, the larger the city, the more time and effort will the duties of the position of councilman require. For both reasons, an individual's investment in politics would appear to be associated with the size of the political unit in which the individual serves.

⁸Schlesinger makes a similar distinction between *static* and *progressive* goals in his ambition theory of recruitment. *Op. cit.*, 10.

and elective offices. Winning is essential, although sometimes electoral victory must be subordinated to maintaining the organization." *Ibid.*, 17.

⁷The larger project of which this analysis is a part, the City Council Research Project, is sponsored by the Institute of Political Studies, Stanford University, and is supported by the National Science Foundation under contract GS 496 and GS 1898.

In addition, those who run for office in cities in which the elections are closely contested are likely to have to campaign more vigorously for their office and thereby pay higher costs. Thus, the councilmen from the larger and more competitive cities are likely to have made a greater investment in politics than those who come from the smaller and less competitive cities,⁹ and this variation in their investment in politics should be related to their commitment to politics in general.

Therefore, we are employing three estimates of the councilman's commitment to politics: (1) two surrogate measures for the initial investment of seeking the councilmanic position, the size of the city and the average closeness of the vote in city elections; (2) the councilman's expressed desire for the office of councilman; and (3) the councilman's expressed intention of seeking other political and governmental offices. The first reflects the *risk* the councilman sustained in seeking the councilmanic position, the second reflects his *positional commitment*, that is to say, the value he places on his current position, while the third reflects his *progressive commitment* to politics.

II. POLITICAL COMMITMENT AND THE SOCIALIZATION OF POLITICIANS

What is it that sets the "politician" apart from other participants in the political process? If we were to conduct a study of professional politicians, we would probably locate a large number of attitudes and values that are somewhat distinctive of politicians as a group.¹⁰ In this study

⁹ Both the size of the city and the closeness of the vote in elections are related to the cost of running for office, the amount of time and effort the councilman puts into his campaign, and some of the psychic costs of electoral contesting. Both relationships are positive and strong; and these results can be seen in Gordon S. Black, *The Arena of Political Competition* (Indianapolis, Ind.: Bobbs-Merrill, forthcoming).

¹⁰ Although there are a large number of studies that explore the attitudes and values of politicians of various kinds and a large number of studies that explore the attitudes and values of the general public, only a few studies actually compare the attitudes of politicians with the attitudes of the general public, and these restrict themselves to attitudes on public policy. See Warren E. Miller and Donald E. Stokes, "Constituency Influence in Congress," this REVIEW, 57 (March, 1963), 45-56; Charles F. Cnudde and Donald J. McCrone, "The Linkage Between Constituency Attitudes and Congressional Voting Behavior: A Causal Model," this REVIEW, 60 (March, 1966), 66-72.

we are concerned with two general attributes that probably differentiate politicians as a group from other individuals in the society.

The first involves the councilman's definition of his role on the council and the manner in which he believes others define that role. An officeholder need not see himself as a "politician," especially at the local level. He may define himself and his work on the council in strictly non-political terms, and he may perceive that politics is irrelevant to his activities on the council. At the same time, he may perceive that the citizens in his community do not define his role as that of a politician. He may believe that they simply see him as another citizen, or perhaps as a public servant, but not as a politician. In fact, many local officeholders are probably loath to consider themselves as "politicians" because of the negative connotations of that term for so many people.

One element, therefore, in the politician's socialization process is the extent to which the individual defines his activities as "political," or sees himself as a "politician." But an individual's role is not entirely self-defined; a role is also defined by the expectations of others.¹¹ Of equal importance, then, is the extent to which the officeholder believes that the citizenry of his community defines his role as "political." These two sets of expectations form one dimension of the politician's socialization process.

A second element in that process has to do with what many students of American politics believe to be the dominant skill in politics in this country, a skill at bargaining. While we do not know the actual extent to which these councilmen engage in bargaining, we do have information on their perception of the extent to which bargaining occurs on the council and on their attitude toward bargaining in general. If a councilman is going to acquire some skill at bargaining, it seems safe to presume that he must begin to see bargaining in a positive light. If a councilman engages in bargaining behavior on the council, it also seems safe to presume that he

¹¹ Robert K. Merton suggests that the occupant of a given *status*, in this case the councilmanic position, has a role-set that is the "... complement of role relationships which persons have by virtue of occupying a particular social status." For the councilman, the public is a "significant other" with which he interacts, and what we are examining here is the councilman's perception of how the public defines his role in the position he occupies of councilman. *Social Theory and Social Structure* (New York: The Free Press of Glencoe, 1957), pp. 368-370.

will perceive that bargaining occurs on the council.

These two elements probably precede the acquisition of skill in political bargaining. In a sense, they are necessary but not sufficient conditions for becoming a skilled bargainer. While those who are favorably disposed toward bargaining may, of course, never acquire the skill to bargain, they are much more likely to acquire that skill than those who are antagonistic toward bargaining.

Returning to our earlier argument, then, we should expect to find that the three components of political commitment are related to the likelihood that an individual will internalize the political attitudes and role definitions outlined above. We can summarize these hypotheses in the following set:

Hypothesis Set I: The larger the city and the more intense the electoral competition in the city, (1) the more likely is the councilman to see himself as a "politician," (2) the more likely is the councilman to believe that the citizenry defines his job as that of a "politician," (3) the more likely is the councilman to perceive that bargaining occurs on the council, and (4) the more likely is the councilman to have a positive opinion about the importance of bargaining.

Hypothesis Set II: The higher the *positional commitment* of the councilman; (1) the more likely is the councilman to see himself as a "politician," (2) the more likely is the councilman to believe that the citizenry defines his job as that of a "politician," (3) the more likely is the councilman to perceive that bargaining occurs on the council, and (4) the more likely is the councilman to have a positive opinion about the importance of bargaining.

Hypothesis Set III: The more intense the *progressive commitment* of the councilman to seek other political or governmental offices; (1) the more likely is the councilman to see himself as a "politician," (2) the more likely is the councilman to believe that the citizenry defines his job as that of a "politician," (3) the more likely is the councilman to perceive that bargaining occurs on the council, and (4) the more likely is the councilman to have a positive opinion about the importance of bargaining.

These three sets of hypotheses link the *risk* that councilmen sustained to obtain the council seat, the commitment they have for their position on the council, and their ambition for other offices to the various perceptions, attitudes, and values discussed above. Although we will examine these variables two at a time, the important

issue is the pattern that exists across all of the variables. Each of these empirical propositions examines a slightly different aspect of the broader theoretical hypothesis that an individual's commitment to a given career, in this case politics, is related to the extent to which the individual internalizes the norms and values associated with his profession.

The Role of the Councilman as a Politician

On the whole, the city councilmen in this study do not see themselves as "politicians." Over half of the councilmen (54%) define the councilmanic position in strictly "nonpolitical" terms, i.e., that the position requires no political skills whatever. When asked how the citizens viewed their position, only 10% of the councilmen indicated that the citizens in their communities tended to view them as "politicians." Of the remainder, 62% believe that the citizens think of the councilman as a "public servant" while 28% of the councilmen believe that the citizens of their community simply think of them as another "citizen."

These views, which tend to subscribe to the position that local politics is apolitical in character, disguise a considerable amount of variation in the pattern of attitudes. As a part of our first hypothesis set, we suggested that the councilmen in the "large" cities with "closely contested" elections would be the most likely to define their own role in political terms, while the councilmen from the "small" and essentially non-competitive cities would be the least likely to think of themselves in political terms. In addition, the effect of the two variables should be *cumulative*, that is to say, both variables should have a positive effect on the likelihood that a councilman will see himself as a "politician."

In order to test this proposition we divided the cities into two categories, those above 30,000 in population and those below.¹² The measure of competitiveness for the city was the closeness of the vote among the various candidates for office. This measure was obtained by calculating the *Mean Deviation* of the vote among all the candidates who received more than 15% of the vote, and then the scores (Mean Deviations) for

¹² The selection of 30,000 as a cutting point was an arbitrary decision on my part. I do not suggest that this particular cutting point has any special virtue that sets it above other cutting points in the same general range of cities. My only real concern was to choose a point that seemed large enough to separate out the cities in which the costs of running for office were significant, but small enough that I had sufficient councilmen in the large cities for the analysis.

five elections in each city were averaged to obtain a measure of the closeness of the vote for the city over a ten-year period.¹³ The councilmen were then divided according to whether the city in which they were elected was "high" or "low" on the measure of the closeness of the vote.¹⁴ In Table 1 these two variables are correlated with the councilman's view or role definition of his job as a councilman.

TABLE 1. THE COUNCILMAN'S ROLE DEFINITION OF HIS POSITION BY THE RISK OF RUNNING FOR OFFICE IN HIS COMMUNITY

Position's Requirements ¹⁵	Large Population			Small Population		
	Average Closeness of Vote			Average Closeness of Vote		
	High %	Low %	N	High %	Low %	N
Politician or political skill	70	—		46	32	
Nonpolitical	30	—		54	68	
Respondents	(73)	(12)*	(85)	(136)	(114)	(250)

* Too few cases to analyze.

¹³ These cities are all, in effect, multiple member districts. There were, on the average, more than two candidates for every office, and there were always more than two councilmanic positions at stake. The *Mean Deviation* (or Absolute Deviation as it is sometimes called) is computed by determining the sum of the absolute deviations from the mean number of votes per candidate and then dividing that sum by the number of deviations. The *Mean Deviation* is a measure of dispersion around the mean, but it differs from the standard deviation in that it weighs every deviation the same, rather than weighing extreme scores more heavily. In almost all cases, the measure of the closeness of the vote, the *Mean Deviation*, was determined from five elections in each community, and the average was taken and is used here.

¹⁴ The cutting point was a score of 13% for the average of the *Mean Deviations*. The range of the variable was from 8% to about 18%, but there were four cities that never had contested elections. This cutting point was chosen because it stood at the middle of the range.

¹⁵ The question for this variable was: "Which of the following would you say comes closest to your conception of the requirements of the job of City Councilman? The councilman then chooses between four statements; the first indicated that the job was a "tough political job" that required the councilman to be a "real politician," the second suggested that the job required "some political skills," the third indicated that the job required the

TABLE 2. THE COUNCILMAN'S PERCEPTION OF THE VIEW OF HIS JOB HELD BY THE CITIZENS IN HIS COMMUNITY BY THE RISK OF RUNNING FOR OFFICE IN HIS COMMUNITY

* Rounding error.

** Too few cases to analyze.

Among the "high risk" cities, i.e., those that are "large" and closely contested, 70% of the councilmen define their job on the council as that of a "politician," or at least they indicate that the position requires political skills. Among the "low risk" cities, however, only 32% of the councilmen describe themselves as "politicians" or indicate that their job requires political skills. Thus, there is a 38% increase in the number of councilmen who define their position in political terms as one increases the risk attached to running for the council. Although the small number of cases in one column makes it impossible to determine whether the two variables have a fully cumulative effect across the whole table, an increase in the closeness of the vote among the small cities does show a corresponding 14% increase in the percentage of councilmen who define their position in political terms. The relationships here seem fairly clear: the greater the investment risk in running for the council, the more likely is the councilman to define his position in political terms.

This same pattern is observed when the dependent variable is the councilman's perception of how the citizens in his community view his role as the councilman. (See Table 2.)¹⁶

"ability to get along with people," but was not political, and the fourth statement suggested that a City Councilman was a "public servant." In dividing the Councilmen, the Councilmen who chose the first two statements were grouped together and the Councilmen who selected the second two statements were grouped together.

¹⁶ This question was: "In your opinion which of the following best describes the way the people in your community view the job of being a City Councilman?" The responses were "a real politician," a "public servant," or "as just another citizen and by no means a politician."

Among the "high risk" cities, 32% of the councilmen think that their constituents view them as "politicians" while only 11% of the councilmen believe that their constituents view them as "just another citizen." In the "low risk" cities, the pattern is just the opposite; only 6% fall in the "politician" category while 34% of the councilmen believe that the citizens in their community view them simply as a "citizen." And, as in the previous table, an increase in the closeness of the vote, i.e., risk, is associated both with an increase in the tendency of councilmen to answer "politician" and with a decrease in the tendency to respond with "citizen." The net increase across the columns is 26% as opposed to a 38% increase in the previous table.

One might argue that the positive relationships between size and competition, and the two variables of role perception are a function of some other factor besides investment risk. The differential willingness to incur the risk of running for office reflects only one dimension of commitment, and we need not rely on these two variables by themselves.

The other two dimensions of commitment are, in this case, the councilman's positional commitment and his progressive commitment to politics. As a measure of the councilman's commitment to his position on the council, they were asked how much they wanted the office of City councilman during their last campaign for the council.¹⁷ Their answers reflect the value the councilmen placed on their office at the time of their last election. In addition, the councilmen were asked whether or not they intend to seek other political or governmental offices, i.e., the councilman's progressive commitment to politics. Councilmen were divided on this question into those who *may* seek other offices and into those who *will not* seek such offices.

The pattern of relationships in Table 3 is similar to that found in the previous two tables. Among those councilmen who are both positionally and progressively committed to politics, 75% indicate that they think of themselves as "politicians" or see their position as requiring "political skills." Among the least committed

¹⁷ *Positional commitment* was measured with a scale item that asked the Councilman to estimate his "desire and efforts to be elected to the Council during (his) last campaign." *Progressive commitment* was determined by asking the Councilman whether there were "any other political or governmental positions—local, state, or federal—which you would like to seek?" Councilmen who indicated any interest in such positions were grouped together.

TABLE 3. THE COUNCILMAN'S ROLE DEFINITION OF HIS POSITION BY THE COUNCILMAN'S DESIRE TO OBTAIN OTHER POLITICAL OR GOVERNMENTAL OFFICES CONTROLLING BY HIS ORIGINAL DESIRE FOR HIS SEAT ON THE COUNCIL

Position's Requirements	(Desire for Council Seat)					
	Considerable			Some and Little		
	Desires	Other	Offices	Desires	Other	Offices
	Prob. %	No %	N	Prob. %	No %	N
Politician or political skill	75	52	—	47	38	—
Nonpolitical	25	48	—	53	62	—
Respondents	(60)	(58)	(118)	(75)	(142)	(217)

group of councilmen, those who had only "some or little" desire for their position and who do not intend to seek other political or governmental offices, only 38% consider themselves to be politicians or see their position as requiring political skills. Some 62% believe that the councilmanic position is entirely nonpolitical in character. The pattern across the table is also similar to the previous two tables: both of the variables of political commitment are related to the councilman's definition of this role, and the effect of the two variables is cumulative. In Table 4 the same pattern of effects occurs again.

Among those councilmen who are the most committed to politics, those who placed a high value on obtaining their present council seat and who may seek other political and governmental offices, 35% think that the citizens in their community define their role as that of a "politician" while only 6% believe that the citizens look upon the councilman simply as another "citizen." The pattern is reversed among the least committed councilmen with 6% choosing the "politician" category and 28% selecting the "citizen" response. Again, as before, the percentage of councilmen who believe that the citizens in their communities think of the councilman as a "politician" increases as the councilman's commitment to politics increases, from 6% to 17%, to 20% and then 35%. There is a corresponding decrease in the percentage who respond with "citizen."

The pattern of relationships in Table 4 is common to all of the previous tables and the relationships are about the same in each case. In each case, the percentage of the councilmen who either see themselves in distinctly political terms or who believe the citizens in their communities see the councilman in these terms increases with the level of commitment of the councilman. The more extensive the councilman's political commitment, the more likely is he to begin to define

TABLE 4. THE COUNCILMAN'S PERCEPTION OF THE VIEW OF HIS JOB HELD BY CITIZENS BY THE COUNCILMAN'S DESIRE TO OBTAIN OTHER POLITICAL OR GOVERNMENTAL OFFICES CONTROLLING BY HIS ORIGINAL DESIRE FOR HIS SEAT ON THE COUNCIL

* Rounding error.

his role as that of the "politician." These findings tend to confirm all of the hypotheses stated earlier.

Discussion

On the whole, the councilmen in the San Francisco Bay Area *do not* think of themselves as "politicians," nor do they believe that the citizens in their communities think of the councilman as a "politician." When offered a choice, they prefer to think of themselves as "public servants" or as just another "citizen," and a majority of the councilmen specifically reject the notion that the job of the councilman might either be political or call for political skills.

In general, Americans appear to hold curiously ambivalent views about the "politician" in this society. On the one hand, certain political roles such as the President, Senator, or Mayor are rated very favorably when compared with other occupational roles.¹⁸ On the other hand, the profession of politics is not so highly esteemed; in fact, a large segment of the public apparently thinks that politics is necessarily corrupt and dishonest.¹⁹ One reason for this view has been suggested by Dahl and Lindblom:

¹⁸ See "Jobs and Occupations: A Popular Evaluation," *Opinion News*, 9 (September 1, 1949), 3-19; Mapheus Smith, "An Empirical Scale of Prestige Status of Occupations," *American Sociological Review*, 8 (1943), 185-192.

¹⁹ Hadley Cantril and Mildred Strunk, *Public Opinion 1935-46* (Princeton, N.J.: Princeton University Press, 1951), pp. 584; Mitchell, *op. cit.*, 683-698; National Opinion Research Center, *The Public Looks at Politics and Politicians*, Report No. 20, March, 1944.

... the role (of the politician) calls for actions such as compromise, renunciation, face-saving of oneself, which are morally ambiguous or even downright immoral to people with morally rigorous standards.²⁰

If the role of the "politician" is viewed as negatively as the evidence suggests, this may account for the majority of the councilmen in this study who prefer to define their job and its activities as nonpolitical. The city council is relatively low on the hierarchy of political positions in most instances, and these cities are not only small, but they are nonpartisan as well. Nonpartisanship was intended as a means of insulating the local polity from influences from the partisan political environment, and although that insulation appears to be less than complete in most cases, the existence of nonpartisanship probably does segregate the nonpartisan community somewhat from the surrounding partisan polity.²¹ All three factors, the small size of most of the communities, nonpartisanship, and the nominal status of the councilmanic position probably contribute to the recruitment of councilmen who have attitudes and values that are less "political" than those found in partisan politics.²²

At the same time, however, a sizable number of the councilmen tend to deviate from the rest of their colleagues and from the general public in that they are willing to think of themselves as "politicians." While the arguments above might explain why most of the councilmen think of their role as "nonpolitical," we must seek alternative explanations why a minority nevertheless deviate from the general pattern. Our initial hypotheses suggested that the factors of differential risk and political commitment may be related to the likelihood that councilmen will

²⁰ Dahl and Lindblom, *op. cit.*, p. 334.

²¹ See, for example, Charles R. Adrian, "A Typology for Nonpartisan Elections," *Western Political Quarterly*, XII (June, 1959), 452-457; A. Clarke Hagensick, "Influences of Partisanship and Incumbency on a Nonpartisan Election System," *Western Political Quarterly*, XVII (March, 1964), 112-119; and Oliver P. Williams and Charles R. Adrian, "The Insulation of Local Politics under the Nonpartisan Ballot," this *Review*, 53 (December, 1959), 1056-1066.

²² Although we have no data with which to compare these councilmen to councilmen elected under a partisan system of elections, these councilmen are quite antagonistic toward partisan politics at the local level. Over 90% believe that the community would be worse off with partisan elections, and nearly 90% believe that "better people" are elected under nonpartisan elections.

adopt norms and values congruent with the larger political environment, and the tables tended to confirm these hypotheses. In each case, the adoption of the "political" role was positively and cumulatively related to the risk the councilman was willing to sustain to obtain his seat, and to his positional and progressive commitment to politics.

In each table, however, a sizable proportion of the councilmen do not conform to the general pattern within the table. In the lowest risk cities and among the least committed councilmen, some of the respondents still think of their job as "political." Conversely, some of the more committed councilmen think of themselves in "apolitical terms." One plausible explanation for this is that we are not tapping the full range either of the risk undertaken by officeholders or of the commitment that politicians have to their positions and to political careers. For this reason, the variables of risk and commitment as *measured here* should not be expected to account for all of the variance in the role definitions of the councilmen. This factor will be discussed later.

III. THE COUNCILMAN AND THE BARGAINING PROCESS

Bargaining as a means of reaching decisions pervades the American political system. It is the *modus operandi* within virtually every major political institution in the society such that the very term "politics" is analogous with bargaining for many people. Although this prevalence of bargaining is seen by many students of politics as one of the most important positive characteristics of this society, it is doubtful that the general public views bargaining in such a favorable light. Bargaining appears to connote to many people "behind the back deals" in "smoke-filled rooms" or the pursuit of "private gain" at the expense of the "public good."

At the same time, however, the city councilman is called upon to reach decisions among conflicting demands; and although such policy conflicts are limited in scope to the confines of his community, they may be just as important to the participants as the broader issues of public policy that arise at the state and federal levels of government. And like other governmental decision-makers, and perhaps unlike decision-makers in business and industry, the city councilman can seldom act independently and authoritatively in reaching his decision. He is forced, instead, to bargain and negotiate among the conflicting interests in his community.

In order to determine the councilman's perception of and attitude toward the bargaining

TABLE 5. THE COUNCILMAN'S PERCEPTION OF WHETHER BARGAINING OCCURS ON THE COUNCIL BY HIS ATTITUDE TOWARD THE BARGAINING PROCESS

Amount of Bargaining	Attitude Toward Bargaining		
	Positive %	Negative %	N
Some	90	22	
None	10	78	
Respondents	(145)	(179)	(324)

process, the councilmen were asked: "City councilmen sometimes talk about decisions in terms of bargaining—do you think this goes on in your Council?" This question was employed to determine whether or not the councilman perceived that bargaining occurred on the council; while his attitude toward bargaining was determined by coding his responses to a series of probes about the bargaining process. Table 5 shows the relationship between these two items; the councilman's perception of whether bargaining occurs on the council by his attitude toward bargaining as a technique of decision-making.

The councilman's attitude toward bargaining is clearly related to whether he perceives that bargaining occurs on the council, and the extent of the relationship is striking. Although alternative hypotheses are possible, it appears to be the case that a councilman's attitude strongly affects the manner in which he defines the behavior that occurs on the council. If he believes that bargaining has positive consequences for council decision-making, he tends to define at least some of the interaction that occurs as "bargaining behavior." If he does not hold this view, the councilman, who may be observing similar behavior to those who hold a positive view of bargaining, defines the behavior that occurs as something other than bargaining.

What is more important for this analysis, however, is whether the councilman's view of the bargaining process, both his attitude toward bargaining and his perception of the extent of bargaining, is a function of the variables of risk and political commitment. In Table 6, the councilman's evaluation of bargaining and his perception of the extent of bargaining on the council are correlated with the two variables of electoral risk, the size of his city and the closeness of the vote in city elections.

In both parts of the table the pattern is almost precisely the same. In those cities with substantial electoral risk, the large and competi-

TABLE 6. THE COUNCILMAN'S PERCEPTION OF THE AMOUNT OF BARGAINING ON THE COUNCIL AND HIS JUDGMENT AS TO THE DESIRABILITY OF BARGAINING BY THE RISK OF RUNNING FOR OFFICE IN HIS COMMUNITY

* Too few cases to analyze.

tive cities, about three-fifths of the councilmen have both a positive attitude toward bargaining and believe that bargaining occurs on their councils. At the other end of the continuum, the cities with the lowest electoral risk, only about one-third of the councilmen believe that bargaining occurs on the council and evaluate bargaining in positive terms. A second common element in both parts of the table is the increase in the perception and positive evaluation of bargaining that is associated with an increase in the electoral competitiveness of the city, in which the councilman holds his office. Electoral competition has the effect of increasing the cost, and thereby the risk, of seeking the councilmanic position; and those councilmen who were elected in the small cities that were competitive seem to have a more favorable view of the bargaining process than those councilmen elected in the less competitive small communities.

The pattern of relationships found in Table 6 is congruent with the results of earlier tables. The variables of electoral risk, i.e., city size and the closeness of the vote in city elections, were related *both* to the role expectations of councilmen and to their attitudes toward the bargaining process in their communities. In each instance the councilmen who are elected in high risk cities are more likely to hold "politicized" attitudes about their role in the local political process. But electoral risk only reflects one aspect of the politician's commitment to politics; and in Table 7 the measures of positional and progressive commitment are correlated with the

TABLE 7. THE COUNCILMAN'S PERCEPTION OF THE AMOUNT OF BARGAINING ON THE COUNCIL AND HIS JUDGMENT ABOUT THE DESIRABILITY OF THAT BARGAINING BY THE COUNCILMAN'S DESIRE TO OBTAIN OTHER POLITICAL OR GOVERNMENTAL OFFICES CONTROLLING BY HIS ORIGINAL DESIRE FOR HIS SEAT ON THE COUNCIL

two measures of the bargaining process.

In the first part of the table, the councilman's perception of whether bargaining occurs on the Council is related to both measures of political commitment. The more committed a councilman is to his office, i.e., his positional commitment, and the more committed the councilman is to seek for other political or governmental offices, i.e., his progressive commitment, the more likely is he to believe that bargaining occurs in the councilmanic decisional process in his community.

The relationships in the second part of the table, however, deviate somewhat from the general pattern that has been observed throughout this analysis. The variable of progressive commitment follows the predicted pattern: the more committed councilmen are more likely, on the whole, to have a more positive orientation toward bargaining; but the variable of positional commitment is only slightly related to the councilman's attitude toward bargaining. Although the relationship between the councilman's desire for his position and his attitude toward bargaining follows the predicted positive direction, the strength of the association is very small and is not significant at the .05 level.²³ The argument

²³ Tests of significance and measures of association have not been presented with the data for two reasons. All of the tables with the exception of this one show associations that are significant at the .05 level with the Chi-square test of significance. For that reason, the presentations of significance levels is redundant. Also, the argument rests on a

in this paper, however, is based on the results of a number of hypotheses and a number of tables, and a separate interpretation for this case does not seem warranted, especially because the direction of the effect that does occur is positive, even though it is small. At the same time, it does suggest that positional commitment for the councilmen may not be as strong a measure of the councilman's generalized commitment to politics as is the councilman's desire to seek other political and governmental offices.

With the exception of the case just discussed, the results of these and the earlier tables seem to confirm the general hypothesis that the socialization of the officeholder is linked to his generalized commitment to politics and to a political career of sorts. But before turning to a discussion of these findings, there is an alternative hypothesis that requires examination.

IV. SOCIAL PLURALISM, RISK, AND POLITICAL COMMITMENT

In the analysis above, the variable of community size has been employed as a measure of electoral risk. For most of the councilmen and for most officeholders in general, the avenue of advancement is via the electoral arena, and that arena has a set of costs attached to it that all potential officeholders must at some time pay. These are fixed costs and they must, in varying degrees, be paid by every candidate whether or not the candidate wins. They constitute a *risk* for the candidate in the sense that the candidate will lose all or at least part of these costs if the candidate loses. Although the risk of seeking office will vary considerably from candidate to candidate, depending upon a large number of individual factors, we have argued that these costs will, in general, be an increasing function of the size of the city and the degree of competition in city elections.

At the same time, however, the variable of city size reflects a second dimension of commu-

nity life, the extent of the social pluralism in the community. From Madison to the present, students of political life have recognized that the size of a political unit is highly related to the diversity of groups, factions, and interests that will be present in the unit. In this study the cities range from several that are less than 2500 in population to the largest, San Jose, which is over 400,000 in population. We have employed 30,000 as the dividing point for dichotomizing the variable of city size, and although the size of a city is not a perfect indicator of social pluralism, it seems obvious that the cities over 30,000 are, on the whole, considerably more socially pluralistic than those under that size.²⁴

The importance of social pluralism in this instance derives from its relationship to bargaining. Where a community is highly pluralistic such that no one group, faction, or interest can dominate a community, bargaining becomes a necessity. Thus the size of a city may be related to the councilman's perception of and attitude toward bargaining through the intervening effect of social pluralism and not because of the factor of risk. In an empirical sense, both the variable of social pluralism and the variable of risk are multi-dimensional constructs, and it is not at present possible to establish a single indicator for each variable; and for that reason, it is not possible to test which of the two variables, social pluralism or risk, is responsible for the shift in the councilman's attitudes toward the bargaining process.²⁵

Although we cannot establish which of these two factors associated with city size is producing the effect on the councilman's orientation toward bargaining, it is possible to show that a primary dimension of political commitment, the councilman's desire to seek other political or governmental offices, is related to the councilman's attitudes and orientations even when the effects of size are controlled. In this manner the

set of relationships, rather than a single relationship, and the test of significance for all of the tables is significant at less than .0001 level. Measures of relationship such as the tau-beta or tau-c would be misleading because we only have a limited range of the independent variables of commitment. Obviously, political commitment extends down to people who have little or no interest in politics and upward to people who make politics their exclusive career. Restriction of the range of the independent variable, as in this case, would naturally lower the measures of relationship between the independent variables and the dependent variables in the study.

²⁴ See, for empirical evidence, Jeffrey K. Hadden and Edgar F. Borgatta, *American Cities: Their Social Characteristics* (Chicago: Rand McNally, 1965). They show correlative evidence that size is strongly related to the social, demographic and ecological diversity within a community.

²⁵ The cost factors in electoral politics cannot be cumulated because it would involve making interpersonal comparisons of utility. The variables of social pluralism cannot be aggregated because we know of no theoretical method of integrating the characteristics of social pluralism. For these reasons, the factor of size, which is roughly related to both risk and social pluralism, is employed as a surrogate measure that approximates the variables.

TABLE 8. THE COUNCILMAN'S DEFINITION OF HIS OWN POSITION'S REQUIREMENTS AND THE COUNCILMAN'S PERCEPTION OF THE VIEW OF HIS JOB HELD BY THE PEOPLE IN HIS COMMUNITY BY THE COUNCILMAN'S DESIRE FOR OTHER POLITICAL OR GOVERNMENTAL OFFICE CONTROLLING BY THE SIZE OF HIS COMMUNITY

Position's Requirements	Large Population			Small Population		
	Desires	Other Offices		Desires	Other Offices

Public servant	50	50		56	65	
Citizen	7	13		23	31	
Respondents	(42)	(38)	(80)	(73)	(149)	(222)

influence of political commitment on the politician's socialization process can be established irrespective of the effect of social pluralism.

Both of the independent variables, city size and the councilman's ambition for other political or governmental offices, are positively related to the councilman's role orientations, but the important consideration here is that the councilman's progressive commitment to politics is related to his role orientations even when the variable to community size is controlled. Thus, even if we cannot distinguish between the effect of city size as a measure of social pluralism from the effect of city size as a measure of electoral risk, it is possible to show that one of the other measures of the councilman's commitment to politics is related to his orientations toward his role as officeholder. We can obtain additional evidence for this finding by examining these two independent variables with regard to the councilman's orientations toward bargaining.

In Table 9, as in the previous table, both of the independent variables are related to the councilman's orientations toward the bargaining process. Thus when size is controlled, the councilman's ambition is still related to his perception of and attitude toward the bargaining process. In fact, of the 29% net shift across the whole table with regard to the extent of perceived bargaining, about 19% is associated with the councilman's ambitions while 11% is associated with the size of the community. Of the 26% net shift in the councilman's evaluation of

TABLE 9. THE COUNCILMAN'S PERCEPTION OF THE AMOUNT OF BARGAINING ON THE COUNCIL AND HIS JUDGMENT AS TO THE DESIRABILITY OF BARGAINING BY THE COUNCILMAN'S DESIRE FOR OTHER POLITICAL OR GOVERNMENTAL OFFICES CONTROLLING BY THE SIZE OF HIS CITY

Amount of Bargaining	Large Population			Small Population		
	Desires	Other Offices		Desires	Other Offices	
	Prob. %	No %	N	Prob. %	No %	N

bargaining, about 15% is associated with the councilman's ambition while 11% is associated with the size of his city. This means that, on the whole, the councilman's ambition is more strongly related to his perception of and attitude toward bargaining than is the variable of city size.

V. CONCLUSIONS

The issue of political ambition, or political commitment, has been with us for some time, but we still know very little in any precise fashion about the relationship between the politician's ambitions and the values and attitudes he adopts towards the political process. Max Weber, for example, examined the emergence of the "professional politician" in a number of countries, and he then proceeded to relate this new type of political participant to a number of aspects of the political system.²⁶ More recently, James D. Barber, in his study of the Connecticut legislature, explored the relationship between the state legislator's involvement in the legislature and his attitudes and orientations toward the political process.²⁷ And James Q. Wilson has

²⁶ Gerth and Mills, *op. cit.*, pp. 83, 87.

²⁷ Barber divides his respondents into four groups on the basis of two variables; the legislator's willingness to return three or more times to the legislature and his activity as a legislator. Both of these variables are similar in character to those of this study in that both variables reflect the willingness to invest in politics, and the findings of his study are similar to the findings in this study. For ex-

suggested that the "amateurs" in the political club movements of California, Chicago, and New York have quite different styles, attitudes, and values than the "professional politician" and that these differences are, in part, a function of the different motivations of "amateurs" as opposed to "professional" politicians.²⁸

But perhaps more than anyone else, Joseph A. Schlesinger has elevated the variable of political ambition to a central place in the study of the political process, particularly the recruitment process. In his seminal study of the opportunity structure in the United States, Schlesinger suggests:

To slight the role of ambition in politics, then, or to treat it as a human failing to be suppressed, is to miss the central function of ambition in political systems. A political system unable to kindle ambitions for office is as much in danger of breaking down as one unable to restrain ambitions. Representative government, above all, depends on a supply of men so driven; the desire for election and, more important, for re-election becomes the electorate's restraint upon its public officials. No more irresponsible government is imaginable than one of high-minded men unconcerned for the political futures.²⁹

The findings of this study, although limited in scope to city councilmen, suggest the politician's ambition, or more broadly, his political commitment, are not only related to the recruitment of politicians, but to the socialization of councilmen as well. What we found in nearly every case was that the more committed councilmen, those who were willing to take the greatest risk and who expressed the most desire to proceed to other political or governmental offices, were also the most likely to express attitudes and values appropriate for success in a decentralized and pluralistic political system.

One possible implication of these findings is that both the recruitment process and the socialization process for politicians may be evaluated

in light of the utility calculus of the politician.³⁰ When one examines the ambitions and political commitment of prospective politicians, we are in fact examining the rational calculus that the political actor makes, with respect to a given set of alternatives. To say that a man is politically ambitious is to say that he places a high value on the alternatives within a sequence of political roles. In this case, we asked the councilmen to evaluate both their current position and the next position they may seek. In addition, we constructed a rough estimate of the amount of *risk* that they had to sustain in order to obtain the councilmanic position that they held at the time of the study. All of these elements are components of the utility calculus.

What is less obvious, however, is that attitudes and values may be also a part of the rational actor's utility calculus. Suppose, for example, that some attitudes will increase the probability of success in a given career sequence while other attitudes might have the converse effect; they might make it much more difficult to achieve success in a given career. The rational actor, if his desire is to move up the career sequence, is likely to adopt those attitudes which increase his probability of success in that career, unless of course, the set of attitudes in question is very repugnant to him such that adopting them would involve a very high cost. But if he refuses to adopt the attitudes, he may well have to pay the cost of being less successful than he might otherwise wish. In either instance the net result would seem to be the same, and an examination of higher levels in any career line should show increasingly greater homogeneity of attitudes and values, either because individuals adopted the attitudes in order to be a success or because the individuals who refused to conform were screened out at lower levels in the career line.

The findings of this study seem to conform to such an interpretation. On the whole, the more ambitious councilmen, those willing to sustain a substantial electoral *risk* and who also wish to go on to other offices, tend to have role orientations and attitudes towards bargaining that are congruent with the demands of the larger political environment. They are the potentially "professional" politicians.

In one sense, these results are more significant than the data seems to suggest. The reason for

ample, among the most committed of his subjects, those willing to return to the legislature and who have a high activity level (Law-makers), 55% identify themselves as "politicians" and 82% have engaged in major negotiations. Among the least committed group, those not willing to return three times and low on legislative activity (reluctants), only 33% identify themselves as "politicians" and only 47% have engaged in major negotiations. *Op. cit.*, pp. 25-26, and 166-167.

²⁸ Wilson, *op. cit.*, pp. 1-31.

²⁹ Schlesinger, *op. cit.*, p. 2.

³⁰ Running for office is a form of political participation. For an analysis of voting behavior using utility analysis, see William H. Riker and Peter C. Ordeshook, "A Theory of the Calculus of Voting," *American Political Science Review*, 62 (March, 1968), 25-42.

this is that the empirical indicators of risk and political commitment only measure a limited range of these variables. This study is of city councilmen, and, as such, the distribution of respondents only cover a small range of either risk or commitment. Neither the uncommitted individual nor the highly committed, professional politician is found among our subjects. Because the distribution of respondents only covers a small range of the independent variables, we should only be able to predict a portion of the attitudinal distribution of political activists. If the subjects of the study had shown a greater range of political commitment, we should have found an even stronger set of relationships than we found in the tables.

The findings here, however, are limited and they will not permit an examination of some of the broader issues in the recruitment and socialization of politicians. Our data strongly sug-

gest that the ambitions of politicians are related to at least some of the attitudes and orientations that politicians have toward the political process. Apparently, the city councilmen in the study are involved in the process of professionalization, and the more ambitious of the councilmen are learning a set of orientations and attitudes that will aid them in their pursuit of future political goals. Although it is not possible with this data to show whether they are recruited because they had these attitudes originally or whether they were socialized into these attitudes after they came on the council, we did confirm our hypotheses that the presence of "politicized" attitudes is a function of the measures of electoral risk and political commitment. The consistency of the findings suggest that the relationship between the ambitions of politicians and the process of professionalization is both positive and strong.

POLITICAL ATTITUDES OF DEFEATED CANDIDATES IN AN AMERICAN STATE ELECTION*

CHONG LIM KIM
The University of Iowa

Electoral victories and defeats occur repeatedly. This is especially true in democratic political systems where key governmental roles are filled through periodic elections. The attitude of defeated candidates toward the regime norms directly affects the system stability, because disaffected by defeat, these candidates may withdraw their support for the regime and may also translate such disaffection into radical political action. Despite the potential threat the defeated electoral candidates can pose to democratic stability, their political attitudes have rarely been investigated systematically in political science literature.¹ Do defeated candidates exhibit an attitude toward the democratic rules and norms governing electoral competition significantly different from that of winning candidates? Do defeated candidates become politically less active after the election than they were before? Under what conditions do they become disaffected with the democratic rules and norms? This paper attempts, first, to compare the political attitudes of both winning and losing candidates, and second, to explore the variables which might account for differences in such attitudes.

The data used in this paper are derived from a larger study of political recruitment in Oregon.² Structured interviews were conducted with

both winning and losing candidates who ran for the Oregon House of Representatives in the 1966 election. The samples were interviewed at three different times: before and after the primary, and after the general election. This research strategy permits us to analyze the effect of the outcome of the election on the attitudes of the candidates. Data were collected on the candidates' degree of support for the democratic rules of competition, their expected changes in political activity as a result of participation in the election, their career ambitions, and the perceived reward-cost, i.e., the material and psychological gains or losses which accrue to the candidates as a direct result of their participation in the election.

I. DEFINITION AND MEASUREMENT OF KEY VARIABLES

Dependent Variables

The candidates' support for the democratic rules and their expected changes in political activity are the two dependent variables used in this study. Support is defined in terms of the extent to which a candidate considers the formal and informal rules and procedures governing electoral competition as adequate. The operational measure of support is based on a candidate's feelings about the legal and practical requirements for getting elected, the degree of perceived fairness in the election outcome, and his feelings about the overall fairness in the political opportunity structure.³ Responses to these three

election and 92 winners and 17 losers in the primary election. For further details on the samples and sampling procedures, see Lester G. Seligman, Michael R. King and Chong Lim Kim, *Political Recruitment: Winning and Losing in American Politics* (forthcoming).

³ The support items are (a) "In general, do you feel that the legal requirements in getting elected in the election give each candidate the same chance of winning or do some have an advantage?" (b) "In general, do you feel that the practical requirements in getting elected give each candidate the same chance of winning or do some candidates have an advantage?" (c) "In running for office in this district, do you believe that a person can succeed primarily on the basis of ability and initiative or are other things important for success in politics?" and "Is this the way it should be?"

*I wish to express my gratitude to Professors Lester G. Seligman of the University of Oregon and Michael R. King of the Pennsylvania State University for their support and encouragement in this effort as well as the larger project of which it is a part; and also wish to thank my colleague, Vernon Van Dyke for his thoughtful reading of the manuscript.

¹ A few exceptions must be noted: John W. Kingdon, "Politicians' Beliefs About Voters," this REVIEW, LXI (March, 1967), 137-145; Jeff Fishel, "Party, Ideology, and the Congressional Challenger," this REVIEW, LXIII (December, 1969), 1213-1232; and Lester G. Seligman, *Political Recruitment* (Boston: Little, Brown, forthcoming).

² This study includes three samples: (a) a quota sample of 68 candidates interviewed before the primary election, (b) a mixed-stratified sample of 109 post-primary election candidates, and (c) 77 completed interviews from a total population of 110 general election candidates. The present analysis is based on 46 winners and 31 losers in the general

interview items are cumulatively scaled and a single support scale is obtained ($CR = .92$). Our measure of expected changes in political activity is derived from a candidate's responses to three questions: does he intend to follow issues more than before the election? Does he intend to discuss politics more frequently than before the election? And, given the election outcome, does he still intend to continue a political career? Whenever a candidate gives a positive answer, a score is assigned and these scores are summed to form a simple index of expected changes in political activity.

Independent Variables

(A) Perceived Reward-Cost

The conceptualization and measurement of rewards and costs attendant upon electoral victory and defeat present a complex problem. The term "reward-cost" will be defined in terms of both material and psychological gains or losses that result directly from election participation.⁴ The reward is great when a victory in political competition insures high prestige, wealth, influence, and opportunity for career advancement. Conversely, the cost is severe if a political defeat results in the loss of all these. Any attempt to measure the reward-cost of winning and losing confronts at least three kinds of measurement problem. First, the candidates may have different hierarchies of values, and may therefore estimate the reward-cost attendant upon electoral victory and defeat differently. Second, winning a public office does not necessarily mean a career advancement, for it is relative to one's previous social status.⁵ Candidates enter political competition from varying status positions, and it would seem possible that the outcome of an election produces varying degrees of satisfaction or deprivation for different individuals. Finally, measuring the reward-cost is further complicated by two types of incentive associated with public offices.⁶ One of these is the "extrinsic"

⁴Hereafter, the term 'reward-cost' will be used in the singular, for our concern is with the *amount* of perceived reward or cost. But, for some other purpose, we can presumably speak of rewards or costs since there may be different kinds of these.

⁵James D. Barber, *The Lawmakers: Recruitment and Adaptation to Legislative Life* (New Haven: Yale University Press, 1965), p. 36.

⁶See James Q. Wilson, *The Amateur Democrat* (Chicago: The University of Chicago Press, 1962), p. 4; Peter B. Clark and James Q. Wilson, "Incentive Systems: A Theory of Organizations," *Administrative Science Quarterly*, 6 (September, 1961), 134-137; and John C. Wahlke *et al.* *The Legislative System: Explorations in Legislative*

reward-cost, which may be defined in terms of the gains or losses in income, occupation, prestige, influence, and career opportunity. The other type is the "intrinsic" reward-cost that a candidate derives from participation itself, such as a sense of fulfillment of civic duties or community service.

Our operational measurement of reward-cost is based on a battery of questions designed to determine the effect of electoral victory and defeat on a candidate's social esteem, income, occupation, career opportunity and political influence. Obviously, some reward-costs are more important than others but for the purpose of this analysis each reward-cost item is assigned the same weight.⁷ Nine such items are used and the responses to these questions are coded into positive, neutral, and negative categories.⁸ For example, our respondents responded to: "As a consequence of the election, do you anticipate any change in your circle of close friends?" Responses are coded: (a) gained more friends, (b) no change, or (c) lost some friends. A summated scale of the reward-cost is constructed: each respondent who gives positive and/or negative response is assigned a score based on the arithmetic sum of his coded responses.

(B) Career Ambition and Expectation about the Election Outcome

Both Eulau and Schlesinger have argued that analysis of a politician's ambition illuminates his behavior because ambition "probably molds a

Behavior (New York: John Wiley & Sons, Inc., 1962), pp. 113-119.

⁷I am presently engaged in a more detailed analysis of the various types of reward-cost attendant upon electoral victories and defeats in order to determine their relative importance to candidates.

⁸The following items are used to measure the reward-cost: (1) As a consequence of the election, do you anticipate any change in your job, (2) As a consequence of the election, do you anticipate any change in your circle of close friends, (3) Do you anticipate a change in your income as a consequence of the election, (4) Do you feel that your esteem among your colleagues in your occupation has gone up or down, (5) Do you feel that your esteem among members of your religion has gone up, (6) Do you feel that your esteem among your neighbors has gone up, (7) Do you feel that your esteem in your family has gone up, (8) Do you expect that your loss in the election will help or hinder your chances if you decide to run again for the House, and (9) Do you feel that your political influence has increased as a consequence of the election.

good deal of political behavior."⁹ Career ambition is defined by the level of office a candidate wishes to achieve in his career. It is accordingly measured by classifying level of office desired into four categories: national, state, local, and "no ambition." The measure of expectation about the election outcome is derived from a candidate's own assessment of his chance of winning at the beginning of the electoral campaign. For instance, a candidate might at the outset have described his chance of winning as "excellent," "good," "fair," or "poor." It might be expected that defeat would imply a serious career setback for an ambitious candidate—one who hopes to go a long way in politics—and that this might lead to attitudes significantly different from those of candidates with less ambition. By the same token, the differential assessment of chance of winning might also affect the attitudes of the candidates.

(C) Types of District and Election

Districts are classified into safe, competitive, or unsafe, given a candidate's party affiliation. The degree of party competitiveness (measured by the ratio of the registered Republican and Democratic voters and the percentage of time each party has been successful in electing its candidates) and each candidate's party label served as the basis of this classification. The types of election simply refer to the primary and general elections. Our assumption is that types of election and district might account for the variations in the attitudes of the defeated candidates because a candidate running in the safe district, and therefore relatively sure of his victory, may find it more difficult to face up to an unexpected defeat than others running in competitive or unsafe districts. In the same vein, a defeat in the primary election may be considered of less consequence than a defeat in the general election, and if this should be the case, we would then expect significant differences in the attitudes of the primary and general election losers.

(D) Occupation, Income and Education

These stratification variables are included primarily because of two theoretical considerations. The first stems from the general findings of research on the effects of stratification on political

opinions, voting behavior, political participation, and support. Secondly, as Seligman has succinctly stated: "the ousted politician cannot fall below the level his skills and training ensures."¹⁰ Therefore, a candidate's occupation, income, and education may cushion the cost of defeat.

In addition to the eight variables cited above, the incumbent status of candidates at the time of the election may influence subsequent attitudes, for the adverse effects of defeat may be greater for incumbents than for others. We cannot take this potentially important variable into account, however, for lack of data. Out of 60 possible winners for election to the Oregon House in 1966, 47 were incumbent winners and the remaining thirteen were nonincumbents. There were a total of four defeated incumbents and all refused to be interviewed.

II. FINDINGS

Support and Activity of Winners and Losers

Table 1 shows the level of support that the candidates accord the democratic rules of competition after having participated in the primary and general elections. Winners in both primary and general elections exhibited a greater degree of support than did the losers. The difference is not as pronounced for the primary election as for the general election, which suggests that the outcomes of the primary election probably do not change the supportive attitude of the candidates as much as the outcomes of the general election. This point is reinforced when we confine our comparison to the losers. Note that 59

$X^2 = 9.03$, $p < .01$.

percent of the primary election losers reported high support, as compared to only 26 percent of the general election losers ($X^2 = 6.01$, $p < .05$).

Of course, such a difference in support for the democratic rules of the game between the winners and losers may not result from the election itself. It is possible that a greater percentage of the winners might have been supportive from the outset. Since we repeated the support items at various times of the election, we can determine whether this was the case by comparing a candidate's support over time. Table 2 shows that almost one half of the losers, in contrast to only 14 percent of the winners, reported a decrease in support. And this difference is statistically significant ($X^2 = 9.03$, $p < .01$). Thus, it seems safe to conclude that the losers are more likely to be less supportive of the democratic rules than the winners, and that the former are more likely than the latter to reduce their support as a result of participation in elections.

Equally significant is the finding that only a small number of the candidates manifested low support for the democratic rules of the game, regardless of the outcome of the election. Roughly 10 percent of the losers in the general election and none of the losers in the primary election registered low support. It thus appears that winning or losing does effect some changes in support, but does not produce enough disaffection to induce low support for the democratic rules among the losers.

With respect to the expected changes in political activity, Table 3 shows that the winners indicated a significantly higher intention to remain politically active than did the losers. Almost 83 percent of the winners, as compared to only 39 percent of the losers, said that they would spend more time following issues after the general

election than before it ($x^2 = 14.3$, $p < .001$). Similarly, over one half of the winners expected that they would discuss politics more frequently after the general election than before it, while only one-third of the losers reported the same intention. The difference between winners and losers in their intention to continue a political career after the general election is not statistically significant, even though the winners tended to give positive responses slightly more than the losers.¹¹

Factors Influencing the Supportive Attitude and Intention for Future Political Activity of the Defeated Candidates

The analysis in this section is confined to some selected variables which affect political attitudes of the defeated candidates. Table 4 summarizes relationships between the dependent and independent variables discussed earlier.¹² The level of political ambition of the defeated candidates is very strongly associated with their intention for political activity. This evidence suggests that the losers with high political ambition are more likely than the less ambitious losers to exhibit a high intention for political activity ($\text{Gamma} = .75$). The candidates' expectation about the election outcome correlates negatively with support and intention to continue political activity. Those candidates who initially gave an optimistic assessment of their chances of winning seem to manifest a less supportive attitude toward the rules of the game and are less likely to continue political activity than are the other losers who went into the election with less optimism.

Whether a loser ran in a safe or unsafe district appears to make a difference in terms of how politically active he would be after the

¹¹ There are two possible reasons why some candidates wish to continue a political career in spite of electoral defeat. One reason is their belief that they would have a better chance of winning in the next election because they have gained some name familiarity in their districts as a result of the unsuccessful campaign. Another reason is that many of our candidates are what Barber might call "advertisers." Their main motive for running for an office is not because they want to win it but to promote private interests such as legal practice through electoral participation. See Barber, *op. cit.*, pp. 67-115

¹² Both cross-tabulations and between item rank-order intercorrelations are also examined. Although *tau* values are generally smaller than Gammas presented in Table 4, basically the same pattern is observed.

TABLE 3. EXPECTED CHANGES IN POLITICAL ACTIVITY OF THE GENERAL ELECTION WINNER AND LOSER

(In Percentage)

Activity	Response	Winner N = 46	Loser N = 31	X ²	P
1. Do you intend to spend more time thinking about politics and following issues in mass media than before the election?	More Time	82.6%	38.7%	14.24	.001
	No Change	15.2	48.4		
	Less Time	0.0	3.2		
	No Response	2.2	9.7		
		100%	100%

	No	6.5	19.4		
	No Response	2.2	6.4		
		100%	100%		

election. The losers from relatively safe districts showed less enthusiasm for future political participation than did other losers from competitive or unsafe districts. The type of election in which a candidate was competing is also strongly associated with support for the rules of the game and political activity. The primary election losers are more likely than the general election losers to be supportive of the democratic rules and to engage in politics actively.

Contrary to my expectation, a candidate's education is virtually unrelated to either support for the democratic rules or intention for future political activity. Occupation and income variables are weakly associated with support and activity. Compared to the ambition, expectation, and types of election, our stratification variables appear to have far less effect on the attitudes of the defeated candidates.¹³ I will, therefore, exclude them in the following analysis.

¹³ One possible reason why our stratification variables turned out to be weak predictors of the attitudes is the candidates' highly homogeneous social background characteristics. For example, 79% of our respondents have college or advanced degrees, 71% of them have prestigious occupations such as lawyers, doctors, and proprietors of large or medium sized business, and 66% of these candidates make an annual income of \$15,000 or more.

The Perceived Reward-Cost and the Attitudes of the Defeated Candidates

The data in Table 4 reveal that the amount of perceived reward-cost is very strongly associated with both support for the rules of the game and intention for future political activity (Gamma = .56 and .61). The analysis also shows that ambition, expectation, type of district and type of election affect the attitudes of

TABLE 4. SOME CORRELATES OF SUPPORT AND ACTIVITY

(Gamma)

Support Control Group I ($N=20$)	.63
Support Control Group II ($N=28$)	.53
Activity Control Group I ($N=21$)	.65
Activity Control Group II ($N=27$)	.60

the defeated candidates. Therefore, it seems appropriate to control their effects before we proceed to interpret the observed relations between the perceived reward-cost and the attitudes of defeated candidates.

Due to the small sample size ($N = 48$), we cannot opt for the conventional partialling technique. Instead, an *index formation technique* is employed to control simultaneously for political ambition, expectation about the election outcome, type of district, and type of election. The method is "based on the relation of each control classification to the dependent variable. On the basis of these relationships, weights are assigned to each category in control classification and each individual in each category receives the designated weight. These weights are summed for each individual to yield an index based on all of the controls. Finally, the index is used as a control classification in the usual sense."¹⁴

Treating the amount of perceived reward-cost as the independent variable and level of support for the rules of the game as the dependent variable, an index score for each candidate is computed based on four controls (ambition, expectation, type of district and type of election). Then, these index scores are dichotomized to form support control group I and II respectively. Finally, the relationship between the perceived reward-cost and support is examined within each control group. Again, a similar procedure is used to yield control groups for political activity.

Table 5 shows the relationships between the perceived reward-cost and the attitudes of the defeated candidates within each of these control groups. The data clearly indicate that the amount of reward-cost perceived by the defeated candidates as a result of their participation in elections strongly correlates with both support for the rules of the game and intention

for future political participation, even after controlling for the effects of their ambitions, expectations, type of district, and type of election.

It is evident from the above analysis that the amount of reward-cost perceived by a defeated candidate is a powerful predictor of his supportive attitude toward the democratic rules and his intention for future political activity. The higher the perceived reward, the more likely is a defeated candidate to become supportive of the rules and active in politics after the election. Conversely, the higher the perceived cost of defeat, the more likely he is to become disaffected with the accepted rules of the game and further political participation.

The Reward-Cost Attendant Upon Electoral Victory and Defeat

What difference does it make to win or lose an election in terms of the reward-cost? Table 6 presents the data on the reward-cost as perceived by the winning and losing candidates. It is quite apparent that the losing candidates in both primary and general elections perceived a significantly lower reward than the winning candidates. This leads us to believe that the winners and losers are rewarded differently by their respective participation in the election. It is, however, important to underscore the fact that most of our respondents, regardless of the election outcome, are found on the positive side of the reward-cost scale. Among the losers, roughly 82 percent of the primary and 81 percent of the general election candidates reported some rewards. This evidence clearly suggests that the electoral competition analyzed in the present paper is not a winner-take-all type of contest. In spite of electoral defeat, a predominant majority of the losing candidates gained in their social esteem, occupation, career opportunity or political influence.

The finding that the difference between winning and losing is rather moderate in terms of reward-cost (no one reporting "great cost") points to what is probably a significant feature of competition in the American political system. Given the relatively small differences perceived by the winning and losing candidates, the system can be described as a "low risk system."¹⁵ A low risk system exists where the reward of political victories is modest and the cost of defeats minimal. By contrast, a high risk system is char-

acterized by political competitions which result in immense gains for winners in status, wealth and influence, and in extremely severe deprivations for losers.

Speculatively, many new states of Asia and Africa appear to be high risk systems. The potential rewards for victory are immense, for political positions traditionally confer high social prestige and give control over access to wealth. The ladder for upward social mobility is therefore often concentrated in political offices.¹⁶ The cost of political defeat in many of these states is devastating, for political competition tends to be very much warlike and often results in a total victory or defeat. Various factors account for such warlike competition. Among them are the deep cleavages between elites concerning the system goals and the methods of their implementation, a set of mutually reinforcing antagonisms that run along ethnic, tribal, religious, or regional lines, and widespread anti-governmental reflex which Shils has aptly described as an "oppositional syndrome."¹⁷ Moreover, the dominance of a single authoritarian party in many new states makes the emergence of political op-

position constitutionally and practically impossible and thereby increases the potential cost of being a member of a counter-elite.¹⁸

The high cost of political defeat in some of the new states may also be attributed to the fact that many of the political leaders have only limited occupational skills. What little evidence there is indicates that these leaders are "professionals" in the sense that they have no occupation other than politics.¹⁹ Therefore, as Apter has put it, "for them to go out of office is, in effect, to be unemployed."²⁰ And sometimes going out of office means going into exile as well. Because of the great reward associated with political vic-

tory and the severe deprivations inflicted by defeat, political competition in these new political systems tends to be less constrained by the accepted rules of the game than in low risk systems such as the United States.

III. SUMMARY AND INTERPRETATION

The purpose of this paper has been to investigate the attitude of the defeated candidates toward the democratic norms of competition and their inclination to future political activity. Another research objective was to explore the variables which might account for the differences in such attitudes. Major findings and their theoretical implications are discussed as follows.

1. The evidence presented indicates that the defeated candidates in both the primary and general election exhibit a lower support for the democratic rules of competition than do the winning candidates after the election. With respect to their inclination to political activity, the losers showed significantly less enthusiasm than did the winners. It seems, then, quite clear that the winners and losers differ significantly in their supportive attitude and inclination to political activity.

2. However, it is highly important to note that despite the differences between the winners and losers, very few respondents reported low support for the democratic rules of competition after the election. In fact, differentials in support were not between high and low support but between *high* and *medium support categories*. This evidence strongly suggests that the losers do reduce somewhat their level of support as a result of defeat and yet remain basically supportive of the democratic rules governing electoral competition.

3. The result of primary elections appears to have less impact than general elections on the attitudes of candidates. Defeat in the primary election discouraged less candidates than defeat in the general election to continue political activity. Similarly, the candidates defeated in the primary election did not reduce their supportive attitude as much as those candidates defeated in the general election. Where a competitive party system is operative, thereby making general elections meaningful contests, the outcome of general elections is therefore likely to have a greater effect on the attitudes of candidates than that of primary elections.

4. Focusing on the variation in the attitudes of the defeated candidates, we found that their career ambition, expectation about the election outcome, types of district and election in which they ran have some effects on their post-election

attitudes. Those defeated candidates who had initially a high ambition showed a higher inclination to continue political activity after the election than did others who had a low or no ambition. The candidates' expectation about the election outcome is also strongly associated with their supportive attitude toward the democratic rules and inclination to political activity. Those who made an optimistic assessment of their chances of winning before the election, reacted to defeat by decreasing their level of support and their inclination to political activity, while others who assessed their chances of winning less favorably did not react in this manner. Our data also indicate that the type of district in which a candidate is defeated is related to his post-election attitudes. For example, the candidates who were defeated in safe districts manifested considerably lower inclination to political activity than did others defeated in competitive and unsafe districts.

5. The most important finding is perhaps the direct association that we discovered between the amount of reward-cost perceived by the defeated candidates and the manner in which they adjust to the election outcome. The losing candidates who perceived a high reward indicated a visibly higher support for the democratic rules of competition and a higher inclination to political activity than did others who perceived a low reward. This relationship is sustained even when the effects of other variables such as career ambition, expectation about the election outcome, types of district and election are accounted for. Thus it seems quite reasonable to assert that the amount of reward-cost perceived by the defeated candidates is one of the key determinants of their supportive attitude toward the democratic rules and inclination to political activity after the election.

6. The analysis of the amount of reward-cost as perceived by both the winning and losing candidates makes it evident that (1) the winners gain higher rewards than the losers in terms of occupation, social prestige, influence, and career opportunity as we would expect, but (2) a preponderant number of the losers also gain considerable rewards. This clearly suggests that the political competition analyzed in the present paper is a low risk system because the winners did not take all the rewards and the losers did not lose too much.

The findings summarized above have important theoretical implications. Because the withdrawal of support by defeated candidates can be one possible source of political instability, their adherence to the accepted rules of the game is a critical variable for the system maintenance. If

a large proportion of the defeated candidates become disaffected as a direct result of their participation in electoral competition and decide to challenge the legitimacy of the accepted rules, stability will obviously be weakened to that extent. As our evidence indicates, the losers accorded less support as a result of electoral defeat than they did before the election and also exhibited lower support than the winners, and yet, they remained basically satisfied with the rules of the game. Although our data were gathered in one state election, there is reason to believe that the defeated candidates rarely become totally disillusioned with the democratic rules in American political system. Thus, political competition in the United States, unlike that in the high risk systems of Asia and Africa, does not appear to produce many disenchanted losers who can threaten system stability.

Knowledge about why defeated candidates in one political system remain largely supportive of the rules of the game while defeated candidates in another become disaffected can add to existing theories of democratic stability.²¹ Easton has

²¹ A perusal of some existing theories of democratic stability proposed by Eckstein, Lipset, and Almond-Verba, indicates that they have not included the reward-cost dimension of political competition and its relation to stability in their theoretical formulations. See Harry Eckstein, *Division and Cohesion in Democracy* (Princeton: Princeton University Press, 1966) and also, *A Theory of Stable Democracy*, Research Monograph No. 10, Center of International Studies (Princeton University, 1961); S. M. Lipset, *Political Man* (New York: Doubleday, 1959), pp. 45-96; and Gabriel A.

suggested: "Since today's loser in an electoral campaign or policy has an opportunity to become tomorrow's victor [in a stable democracy], differences do not have to be fought out to the knife, unlike those systems where the winner takes all."²² The essence of this argument is that the maintenance of the democratic norms of temperance and moderation in political competition depends in a large measure upon a modest difference between the reward of political victory and the cost of defeat, that is, a low risk system. Where the reward of winning is immensely great and the cost of losing exorbitantly high, political competition tends to be warlike and, therefore, is disruptive of stability.

The direct relationship that we discovered between the amount of perceived reward-cost and the manner in which the defeated candidates adjust to the election outcome is entirely consistent with Easton's contention. The higher the cost of defeat, the greater the likelihood that a losing candidate withdraws his support for the democratic rules of the game and shows a low inclination to political activity. Because a moderate difference between the reward of winning and the cost of losing induces favorable attitude toward the rules of the game among defeated candidates and thereby eliminates one potential source of instability, a low risk system is one important condition of democratic stability.

AMATEURS AND PROFESSIONALS: A STUDY OF DELEGATES TO THE 1968 DEMOCRATIC NATIONAL CONVENTION*

JOHN W. SOULE AND JAMES W. CLARKE
Florida State University

I. THE "AMATEUR DEMOCRATIC" AND THE NEW LEFT

Several years ago James Q. Wilson studied the members of the three amateur Democratic clubs in New York, Chicago, and Los Angeles.¹ He intended his study, by his own admission, to be interesting rather than theoretical, but we have found its theoretical portions to be intriguing. The amateur politicians studied by Wilson primarily concentrated their energies in local politics, although their ambitions extended far beyond local campaigns and issues. Indeed, they expressed a clear desire to alter fundamentally the character of the American party system and, accordingly, all governing institutions.

Wilson's task of identifying and characterizing the political motives and tactics of amateur Democrats was facilitated by the existence of political clubs.² He had only to identify the clubs he wished to study and survey their members. Future researchers were left the responsibility of identifying similar political motives and tactics in less well-defined groups. We attempted to do this for a sample of delegates to the Democratic National Convention in 1968, and, following Wilson's criteria, we were successful in identifying a substantial proportion of amateur Democrats.

The amateur Democrat described by Wilson was not set apart from the more conventional party activists by his liberalism, his age, education or class. He was not a dilettante or an inept practitioner of politics, nor did he regard politics as an avocation or hobby. Rather the amateur found politics intrinsically interesting because it expressed a conception of the public interest. The political world was perceived in terms of policies and principles which were consistent with the amateur's theory of democracy. Internal party democracy and the acceptance and en-

couragement of the largest possible base for participation were given unequivocal acceptance by amateurs. In this sense, intra-party democracy was a salient factor in the motivation of amateur Democrats. Policy goals for the party were conceived to be largely programmatic and were intended to offer clear alternatives to the opposing party. The amateur placed his highest political priorities on intra-party democracy and the party's commitment to specific substantive goals. In sum then, the amateur Democrat described by Wilson was one who perceived politics as the determination of public policy in which issues are settled on their own merits and not simply on the basis of partisan advantage. Thus, the amateur was most reluctant to recognize the necessity of compromising issues for party advantage.³

In contrast to the amateur, whose chief rewards for political participation tend to be somewhat abstract and intangible, the conventional or professional party activist wanted to win elections and thus provide the inducement which followers require for participation. The professional was not concerned with taking positions on controversial and abstract public policies. His preoccupation with winning allowed him to compromise substantive programs more easily than the amateur, although he may have been as liberal ideologically as the amateur. Intra-party democracy was by no means denied by the professional, but it was valued extrinsically for the purpose of creating party unity (i.e., to forge as broad a coalition as possible), rather than for its own intrinsic worth.

Several psychological characteristics of amateurs which appear to determine their general orientations toward politics deserve special attention, as well as some systemic consequences which follow from these orientations. First, there are parallels between the amateur's conception of politics and that of the New Left. The amorphous and ideologically elusive New Left movement, which has captured the attention of the nation also placed great value on participatory democracy. "Participatory democracy is offered as the solution for bridging the gap be-

³ The characteristics of the amateur and professional are described by Wilson in Chs. 1, 10 and 11, *Ibid.*

* This Project was funded by the Political Research Institute at Florida State University.

¹ James Q. Wilson, *The Amateur Democrat* (Chicago: University of Chicago Press, 1962).

² *Ibid.*, ch. 1. We have relied heavily on Wilson's study in designing our own and hereby acknowledge our intellectual debt to him. Henceforth only specific references from *The Amateur Democrat* are noted.

tween the perceived desire by individuals to shape their own destiny and the power to do so."⁴ In this regard, the Port Huron Statement, which outlines the principles of the Students for a Democratic Society, is enlightening. This statement posited democracy *per se* as a value, and not as a mechanism. Its analysis of contemporary society was blunt:

America rests in national stalemate . . . its democratic system apathetic and manipulated rather than 'of, by and for the people' . . . We seek the establishment of a democracy of individual participation governed by two central aims: that the individual share in these societal decisions determining the quality and direction of his life; that society be organized to encourage independence in men and provide the media for their common participation.⁵

In the decade which has followed since Wilson's study of the amateur Democrats we have seen an upsurge of political activism on the part of the New Left. News coverage has provided a great deal of visibility for political dissent and it is not going too far to suggest that contemporary amateur politicians draw practical and theoretical sustenance from some New Left activities. Similarly, New Left people were attracted initially to the programs and candidates backed by amateur Democrats.⁶

Secondly, the conception of democracy held by amateurs clearly implies that citizens are

⁴For examples of this theme, see: Martin Openheimer, "Alienation or Participation," paper read at the 1965 Meetings of the Pennsylvania Sociological Society, and reprinted by the Students for a Democratic Society; Paul Jacobs and Saul Landau, *The New Radicals* (New York: Vintage Books, 1966); Andrew Kopkind, "Of, By and For the Poor: The New Generation of Student Organizers," *The New Republic*, June 19, 1965.

⁵Commonly known as the "Port Huron Statement," this document exists as a statement of principles of the Students for a Democratic Society, 1962.

⁶New Left members have been characterized as being totally alienated by rejecting the contemporary two-party system, thus making comparisons between them and avid partisan amateurs fallacious. See Jacobs and Landau, *op. cit.*, chs. 4 and 5. No doubt there exist many New Left people who completely eschew conventional partisan activity. But these individuals appear to represent what Keniston has labelled the "uncommitted" as contrasted with the "committed" or "radicals." The latter, while nursing an abiding suspicion of political parties and their leaders, are still willing to engage in party activities when they believe there exists an opportunity for achieving some goals.

equipped to operate issue-oriented parties by democratic means in the interest of a common good. The amateur's theory of government stipulates that the electoral choice between candidates in the general election is an insufficient guarantee of democracy, hence the amateur's demand for intra-party democracy. This "town meeting" orientation held by amateurs is rooted in their presumption of an interested and enlightened citizenry which is willing and eager to participate actively in policy formation. Voting behavior research by social scientists raises questions about the validity of these assumptions and has provided support for the conception of democracy in which most of the citizens' interests are better served by a non-programmatic party system in which the electorate is required simply to make a single dichotomous choice between parties rather than to participate in the development of a policy itself.⁷

A third consequence which follows from the amateur's position involves the role of political parties. Wilson has previously pointed out in his study of amateurs that should they triumph over the party professionals, which he viewed as doubtful, parties would serve a divisive function rather than acting as a force for political integration.⁸ This inference stems from the ama-

During the Chicago convention delegates and supporters of Senator Eugene McCarthy often joined New Left protestors outside the convention hotels. One chant in particular, "You killed the party, you killed the party . . ." which was directed at Humphrey delegates, reflects some affinity between amateur Democrats and New Left supporters. See Kenneth Keniston, *Young Radicals: Note on Committed Youth* (New York: Harcourt, Brace and World, 1968) and also *The Uncommitted* (New York: Harcourt, Brace and World, 1965).

⁷Phillip E. Converse, "The Nature of Belief Systems in Mass Publics," in *Ideology and Discontent*, David Apter (ed.) (New York: Free Press, 1964); Angus Campbell, Phillip E. Converse, Warren E. Miller and Donald E. Stokes, *The American Voter* (New York: John Wiley and Sons, 1964), ch. 9; Herbert McClosky, "Consensus and Ideology in American Politics," this REVIEW, LVIII (June, 1964) 361-382; Murray B. Levin, *The Alienated Voter* (New York: Holt, Rinehart and Winston, 1960).

⁸Wilson, *op. cit.*, p. 359. It should be noted, however, that a good deal of diversity exists even within locally based party organization both in terms of motivational and value perspectives. See Samuel J. Eldersveld's insightful study, *Political Parties: A Behavioral Analysis* (Chicago: Rand McNally, 1964).

teur's demand for programmatic parties and their relative unwillingness to compromise their positions. Some observers see this demand and its consequences as a virtue—others do not. Even if intra-party democracy is assumed, the age-old problem still exists of how to handle a situation where the majority of a party has decided upon a programmatic course which a minority cannot conscientiously accept. The amateur's philosophy assumes that a party consensus would emerge after the rational consideration and debate of party programs and candidates. The feasibility of this, however, is highly questionable.⁹

II. THE STUDY DESIGN

Following Wilson's study of amateur Democratic clubs, we have described certain perceptions and psychological traits which distinguish amateurs from professional party activists; we have outlined briefly what appear to be the roots of the amateur's political orientation and the probable political consequences of that orientation. The questions this study was designed to answer are: (1) To what extent can Democrats to the 1968 Democratic National Convention be distinguished with respect to amateurism criteria? (2) What background characteristics distinguish between amateur and professional delegates? (3) What kind of political socialization and recruitment experiences have professionals and amateurs undergone? (4) Does amateurism aid us in predicting the decision-making strategies and candidate-preferences of delegates?

It should be emphasized, that our definition of amateurs and professionals does not include ideological classifications, leadership positions (e.g., being a public office holder), or length of service to the party. Amateurs and professionals are distinguished psychologically by their style and orientation toward politics. It is a separate empirical question whether amateurs hold elected public offices, have a long history as party activists, or are ideologically distinguishable. The distinguishing differences have been

outlined in our previous description. It was with some caution that we operationalized amateurism as a variable to include three categories: amateurs, semiprofessionals (or semi-amateurs), and professionals. The specific summated items used to delineate Democratic delegates are listed below. The underlying theme which each item was designed to capture appears in parentheses:¹⁰

- (1) My party leaders often make too many arbitrary decisions without consulting with sufficient numbers of party workers. (intra-party democracy)
- (2) As a convention delegate basically my only job is to choose a candidate who will win in November. (preoccupation with winning)
- (3) The principles of a candidate are just as important as winning or losing an election. (willingness to compromise)
- (4) Party organization and unity is more important than permitting free and total discussion which may divide the party. (intra-party democracy)
- (5) I would object to a presidential candidate who compromises on his basic values if that is necessary to win. (willingness to compromise)
- (6) Controversial positions should be avoided in a party platform in order to insure party unity. (programmatic parties)
- (7) A good party worker must support any candidate nominated by the convention even if he basically disagrees with him. (willingness to compromise)
- (8) Party platforms should be deliberately vague in order to appeal to the broadest spectrum of voters. (programmatic parties)
- (9) Part-time volunteers play a more important role in the party's campaign than any other segment of a party. (citizen's role)
- (10) Would you characterize yourself as someone who: (a) works for the party year after year, win or lose and whether or not you like the candidate or issues; or (b) works for the party only when there is a particularly worthwhile candidate or issue. (self-characterization)

Respondents were asked to strongly agree, agree, disagree or strongly disagree to each item. The actual classification involved a cross tabular

⁹ More programmatic, internally democratic and responsible parties were recommended by the American Political Science Association Committee on Political Parties in 1950. This report has been subject to some of the identical criticism raised here concerning the amateurs conception of parties. See, V. O. Key, Jr., *Politics, Parties and Pressure Groups* (New York: Thomas Y. Crowell, fifth edition, 1964), chs 9, 12, pp. 662-665; and Austin Ranney, "Toward a More Responsible Two Party System: A Commentary," this REVIEW, XLV (June, 1951), 448-500.

¹⁰ When these items were factor analyzed, four factors emerged. An examination of the four factors indicated that preoccupation with winning, willingness to compromise, intraparty democracy and programmatic parties appeared to be the dimensions underlying the concept "amateurism." Although we have statistically treated amateurism as a unidimensional variable, it can be broken down conceptually into correlated components.

comparison between the delegate's general stylistic preferences (willingness to compromise, relative importance of the electoral victory, and intra-party democracy) and the general self-characterization provided by the response to question number 10. (See Figure 1.)

The Sample

A team of five interviewers gathered data on 187 Democratic delegates and alternates over the four-day convention period at Chicago in August. Our strategy at the outset was to conduct interviews with a pre-selected random sample but the unusual circumstances of the Chicago Convention necessitated a change in this strategy. A quota sample consisting of a proportionate number of delegates and alternates from each state was interviewed successfully by the painful method of seeking out the respondents in hotel lobbies, personal suites, cocktail parties and state party receptions. This method worked well and we met the quota for each state, although on some occasions interviews were terminated before being completed.

In order to allay our doubts about the representativeness of our sample, we obtained an almost complete catalogue of aggregate statistics collected by the CBS News Bureau.¹¹ The CBS data dealt with education, sex, occupation and the number of previous conventions attended. Chi square tests revealed that our sample of 187 delegates were not significantly different ($p > .10$) on any one of the four comparisons. These calculations permit us to have some confidence in the representativeness of our sample, at least along several demographic dimensions, and we accordingly report tests of significance as well as measures of association in analyzing our data.

III. FINDINGS

Social and Economic Correlates of Amateurism

Of the 187 Democratic delegates who were interviewed 180 respondents were classified along the amateurism dimension. Subtotals of 42 amateurs, 52 semiprofessionals and 82 professionals were identified who also answered our questions dealing with age, education and annual income. Contingency tables were generated with amateurism and each of these background variables. The correlations between age groupings and amateurism was .32 (gamma) with the amateurs being younger (not shown in tabular form). Twenty-six percent of the amateurs were

¹¹ We wish to thank the CBS News Bureau for providing us with the *CBS News 1969 Democratic National Convention Handbook*, copyright: Columbia Broadcasting System.

Responses to from 4-6 items in the amateur direction	Amateurs	Professionals
Responses to 3 or less items in the amateur direction	Semiprofessionals	Professionals

under 30 years of age compared to nine percent of the professionals; five percent of the amateurs were over 50 compared to 30 percent of the professionals.

No relationship was found between amateurism and level of education. There was a slightly larger number of amateurs who held post graduate degrees, but the overall correlation observed was low (gamma = .09). Eighteen percent of the professionals not gone beyond a high school education as to eleven percent of the amateurs (not shown in tabular form).

When income level was cross tabulated with amateurism, we found 52 percent of the amateurs earn more than \$20,000 per year compared to 33 percent of the semiprofessionals and 38 percent of the professionals. The overall correlation indicated that amateurs tended to have higher annual incomes but that the relationship was very weak and insignificant (not shown in tabular form).

Of the three background factors considered, age appears to be the best predictor of amateur status. Although none of the variables revealed striking differences between amateurs and professionals, the differences that were observed are generally consistent with those described by Wilson in amateur Democratic clubs.¹² By precise standards these background variables are very crude proxy variables for socialization experiences. We turn now to the examination of several more precise indicators of political socialization and recruitment to party activities and eventually to the 1968 convention.

Political Socialization and Recruitment of Amateurs and Professionals

In this section, we are concerned with the questions of why, when and how the delegates initially became interested in politics. The delegates were asked if they were raised in a family setting in which politics was an active concern. Table 1 shows that semiprofessionals and professionals have nearly an even probability of being

¹² Wilson, *op. cit.*, 13.

TABLE 1. AMATEURISM AND FAMILY'S
POLITICAL ACTIVITY

Political Activity	Amateurs (N=42)	Semiprofessional (N=52)	Professional (N=82)

Inactive	65	47	53
	100%	100%	100%

Gamma = -.12, P > .05.

reared in either a politically active or inactive family. Only 35 percent of the amateurs, however, are drawn from politically active families. The remainder (65 percent) represent the first of their line to participate actively (beyond voting) in partisan politics.

Our data also revealed that professionals and semiprofessionals tended to be younger when they first became active in partisan politics.¹³ Thirty-eight percent of the professionals became active in politics before their twentieth year, as compared to 28 percent of the amateurs. Similarly, 23 percent of amateurs were over thirty when they first became active. Only 15 percent of the semiprofessionals and 14 percent of the professionals delayed this long before becoming active in the party. Those persons who eventually become party professionals tend to develop political interests early in their lives, and then spend years in apprenticeship working within the organization. Further evidence of this is shown in Table 2. Forty-two percent of the professionals reported that their family was the most important influence leading to their involvement in politics. Only 22 percent of the amateurs reported similar experiences. Again, the semi-professionals fall between these two groups. The high school and college experience does not reveal any noteworthy difference between the groups. Adult peer group influence tends to be a more important factor in the socialization of amateurs into party politics. Thirty-nine percent report that their friends and associates were the most important factor contributing to their political involvement as compared to only 22 percent of both the semiprofessionals and professionals who cited this factor. Professionals were also less likely than semiprofessionals and amateurs to be affected by public events (e.g., wars, depressions, and assassinations) which contributed to their entrance into politics. Again, this suggests the importance of

¹³ Not shown in tabular form.TABLE 2. AMATEURISM AND AGENT OF
INITIAL POLITICAL SOCIALIZATION*

	100%	100%	100%

 $\chi^2 = 9.13$, $P < .20$, ** V (Craemers V) = .16

* The question asked was, "who would you say was most important in getting you interested in politics?" This was a closed question.

** While Craemers V is not a commonly used measure of association in social science literature, it is a chi square based statistic which is equivalent to phi in a 2×2 case, and is preferable to Tschuprow's T because its upper limit can be unity when the number of rows and columns are unequal. See Hubert Blalock, *Social Statistics* (New York: McGraw Hill, 1960) 229-230.

early familial experience in the political socialization of the political professional.

In Table 3 we consider partisan longevity, or the years spent active in the party. There are few surprises in this table. The largest category in each group includes those delegates who have been active in the party more than ten years. But, longevity is closely associated with amateur-professional status. Professionals and semiprofessionals have been active in the party for the longest periods of time. This relationship is striking in the 1-2 year category where 24 percent of the amateurs, 4 percent of the semiprofessionals and none of the professionals are represented.

We have shown here that there is a temporal difference in the political socialization of amateurs and professionals. But, what are the political implications of these different experiences? Since the professional's induction into politics occurred early, we may speculate that party identification as transmitted by the family was a most salient concern. We are suggesting that the professional learned that the party was not only a means to certain substantive ends, but that it assumed some intrinsic value—i.e., party loyalty and confidence in the party made it less imperative that the professional be concerned with substantive issues. In short, the professional has confidence in the party. A victorious party meant that issues could be resolved in the best way possible. Such an orientation led to a more

TABLE 3. AMATEURISM AND YEARS
ACTIVE IN THE PARTY

pragmatic approach to the substantive concerns of the party.

The later introduction of the amateur suggests a major modification in this process. The authors of *The American Voter* have suggested that ideology develops later in life and is a function of the intellectual maturity of the individual. In their words,

... in the bulk of cases, the individual is committed to a party at a time when he is least likely to have the wherewithal to bring ideological considerations ... into play.¹⁴

Further evidence of this phenomenon is found in a study of the development of political ideas among adolescents, which concluded that "there is a gradual increase with age in the use of philosophical principles for making political judgements."¹⁵ The amateur's idealism may possibly be explained by the fact that ideological concerns rather than the more direct family socialization experiences led to his entry into partisan politics. If so, we would expect the amateur to view the party in instrumental terms, i.e., as a means to certain ends, rather than an end in itself.¹⁶

These results provide some basis for the following inferences about the adult socialization of Democratic amateurs: The highly articulate yet abstract rationalization of the amateur's participation in party politics which Wilson described¹⁷ may be a function of the amateur's being politically socialized after reaching intellectual matu-

urity. The professional, who was exposed to politics at an earlier age, may have been attracted by less complex concerns. We may speculate that the professional's concern for the party rather than more abstract ideological issues may be a result of his earlier political socialization.

Thus far, we have considered only the informal and frequently less proximate temporal aspects of the political socialization process. In Table 4, we consider the more formal and immediate process of political recruitment, i.e., the method by which delegates were selected for the 1968 Democratic Convention. Although the differences are not striking, both professionals and semiprofessionals are more likely to have been appointed as delegates rather than elected. This tendency is consistent with our earlier discussion of professionalism in which we indicated that organizational loyalty was an inherent part of our definition of professionalism. Since this is the case, it is not unusual in those states which do not require elections for the appointments of delegates to go to those who have served the longest, remained most loyal, and contributed most to the party organization. The more recent entry into partisan activity precludes the recruitment of many amateurs by party appointment.

TABLE 6. AMATEUR-PROFESSIONAL JUDGMENTS ON CONTEMPORARY IDEOLOGICAL ISSUES

Items (liberal response in parenthesis)	Percentages Expressing Liberal Response				
	N	Amateurs	Semi-professionals	Professionals	Gammas
1. Communism today has changed greatly and we must recognize most wars and revolutions are not Communist inspired. (Agree)	184	44%	42%	31%	.19*
2. Viet Nam is historically and geographically an Asian country and should be allowed to develop autonomously within the Asian sphere of power. (Agree)	181	71	73	54	.30*
3. The U.S. should give help to foreign countries even if they are not as much against Communism as we are. (Agree)	185	80	83	75	.13
4. The best way to deal with people who break the law is to punish them so they fear the consequences of breaking it again. (Disagree)	185	44	54	48	.01
5. People who advocate radical changes to our way of life are over-protected by our laws. (Disagree)	185	59	75	59	.06
6. Law enforcement agencies should be allowed limited eavesdropping by wiretapping and other devices. (Disagree)	187	59	45	47	.12
7. Public employees should not have the right to strike for higher wages. (Disagree)	185	59	71	72	.15
8. School children should be bussed to achieve racial balance in elementary and secondary schools (Agree)	179	36	35	31	.09
9. One has a moral responsibility to disobey laws he believes are unjust. (Agree)	186	29	23	7	.52*

Gammas with asterisks indicate a level of significance less than .05. Gammas were computed by considering the responses elicited by each item (strongly agree, agree, disagree, strongly disagree) and amateurism-professionalism as two ordinal variables in a contingency table. See Linton Freeman, *Elementary Applied Statistics* (New York: John Wiley & Sons, 1965) 79-89, 162-175.

Another aspect of longevity—convention attendance—is reported in Table 5. Here again, the data support our earlier findings and, on the surface, include no surprises. For most delegates this is their first national party convention. There are two possible explanations for the data shown in Table 5. First, it is possible that amateurs are mobilized for a particular convention and their absence at subsequent conventions is volitional. Given the nature of the amateur's participation based on more immediate circumstances (e.g., issues, candidates, events), rather than organizational loyalty, it is conceivable that convention attendance is a one-time affair. For example, some delegates, who were committed to McCarthy rather than to the Democratic Party, may choose not to participate in presidential politics in 1972 because the selection process is no longer salient. It is also possible that because of their tenuous commit-

ment to the party, some delegates may be excluded involuntarily by the regular party organization. An alternative speculation is that a conversion process occurs in which amateurs are re-socialized as a result of their involvement in national party politics. That is, they lose some of their idealism and become political "realists" who learn to compromise, and accept the professional's view that the overriding goal of the party is to win elections. This hypothesis is also given some support by our finding that older delegates tended to be professionals. Although it is not possible for us to accept or reject either explanation, we can safely hypothesize that these explanations are not mutually exclusive. An accurate explanation probably includes elements of both.

Ideological Correlates of Amateurism

In this section, we attempt to answer the

TABLE 7. AMATEURISM AND SUMMATED LIBERALISM-CONSERVATISM*

	Am- ateurs (N = 46)	Semipro- fessional (N = 53)	Pro- fessional (N = 88)
Conservatives	15%	17%	16%
Moderates	22	17	34
Liberals	63	66	50
	100%	100%	100%

Gamma = -.03, $P > .05$.

* Respondents answers to each of the items presented in Table 9 were summed together in Likert fashion and then classified as Liberals, Moderates and Conservatives. "No responses" were given the neutral score of 3 on 1-5 scales, hence accounting for the inclusion of all 187 respondents.

question of whether a delegate's amateur or professional orientation is associated with his views on a number of foreign and domestic issues. An examination of Table 6 reveals that there are only three issues which significantly distinguish amateurs, semiprofessionals, and professionals. Amateurs and semiprofessionals are more likely than professionals to agree that "Communism has changed greatly," and that "wars and revolutions are not Communist-inspired." Similarly professionals are more likely than either of the two other groups to take a more aggressive stand on Vietnam.¹⁸ Item 9 most clearly discriminates between amateurs and professionals. Amateurs and semiprofessionals are much more likely to accept the principle of civil disobedience than professionals (gamma = .52). In this case, however, a larger majority of all groups disagree with this basic tenet of civil disobedience. What finally emerges from our examination of Table 6 is not the differences between these groups, but rather the similarities. On six of the nine items there were no significant amateur-professional differences.

Another view of this relationship is shown in Table 7. Here amateurism is associated with the summated liberalism-conservatism scores.¹⁹ The relationship is weak and suggests that amateurs, semiprofessionals and professionals are not distinguishable along ideological lines. This should not be surprising when we recall that the differences between amateurs and professionals ap-

¹⁸ It should be noted here, however, that a majority of all groups agreed with the Vietnam statement, which is a direct quote from a speech by Senator Eugene McCarthy.

¹⁹ See note, Table 10.

TABLE 8. AMATEURISM AND DELEGATES' PARTISAN AREAL ROLE PERCEPTIONS*

Roles	Am- ateurs (N = 40)	Semi- fessional (N = 50)	Pro- fessional (N = 83)
Local	25%	26%	39%
State or region	40	38	37
Nation	35	36	24
	100%	100%	100%

Gamma = -.21, $P < .10$.

* The closed question used to elicit which geographical segment of the party the delegates felt most responsible to was "To what segment of the party do you feel most responsible as a delegate? (a) my local party organization, (b) my state party organization, (c) my regional party, or (d) my national party."

pear to be procedural and stylistic. They have relatively similar attitudes toward substantive issues that might be summarized along a liberalism-conservatism continuum. This finding, however, does not necessarily indicate the salience or the intensity of the expressed opinion and, as we shall show later, when amateurs are put into a compromise situation, which requires flexibility, they react quite differently from professionals holding the same substantive attitudes.

Amateurism and Decision-Making

The effects of amateurism are considered here by examining the responses to three questions concerned generally with party loyalty and candidate preference. First, we asked about the geographical segment of the party to which they felt most responsible as a delegate. The responses to this question are reported in Table 8. The differences are not dramatic (gamma = -.21). But, there is an observable tendency for amateurs and semiprofessionals to define what might be called their areal roles²⁰ in terms of representing or being responsible to state, regional or national constituencies rather than local constituencies.

This tendency is consistent with earlier notions of the professional in politics. Both Merton and Wilson have suggested that the professional politician "is pre-occupied with the local community to the exclusion of his affairs outside his

²⁰ John C. Wahlke, Heinz Eulau, William Buchanan, and Leroy C. Ferguson, *The Legislative System: Explorations in Legislative Behavior* (New York: Wiley, 1962), Ch. 13.

TABLE 9. AMATEURISM AND DECISION-MAKING STRATEGIES IF DELEGATES' FIRST CHOICE FAILS

Strategy	Amateurs (N = 43)	Semipro- fessional (N = 48)	Profes- sional (N = 82)
Vote for another candi- date with whom I agree	95%	83%	63%
Vote for the apparent winner to promote party unity	5	17	37
	100%	100%	100%

Gamma = .63, $P < .01$.

community."²¹ They describe the amateur as a "cosmopolitan" who has minimal ties to the locality and a much stronger attachment to a larger constituency.²²

Another question asked was, "If it appears your first choice cannot win the nomination, what would you do?" In Table 9, we have divided the responses into two groups—those whose support is contingent upon their agreement, in principle, with a candidate and those who would simply vote for the apparent winner in order to promote party unity. It appears that while a majority of all groups intend to adhere to some principle of ideological compatibility professionals are much more likely to compromise that principle for the sake of party unity (gamma = .63). These findings provide support for the notion that the professional is more inclined to compromise certain attitudes in order to achieve party unity, and likewise underline the amateur's relative unwillingness to compromise for the sake of partisan consensus.

Finally, we turn to a consideration of the relationship between amateurism and candidate preference, the latter being the most important factor in assembling the Democratic delegates. An unmistakable relationship exists between amateurism and support for Vice President Humphrey and Senator McCarthy (Table 10). Seventy-one percent of the professionals in our sample threw their support to Humphrey as contrasted with only eight percent who favored McCarthy. The amateurs, on the other hand, divided their support more evenly between the candidates with McCarthy being favored by 41 percent.

In order to assess the relative capacity of the

²¹ Robert K. Merton, "Patterns of Influence: Local and Cosmopolitan Influentials," in *Social Theory and Social Structure* (Revised Ed.; Glencoe: Free Press, 1957), pp. 387-420; and Wilson, *op. cit.*, pp. 10-11.

amateurism variable to predict candidate preference we chose another commonly used variable in analyzing political decision-making for comparison. Liberalism-conservatism (See Table 7) has been used on numerous occasions by political scientists, and although there exists little agreement on operational grounds,²³ the variable has been found to have some predictive utility for political decision-making. The usefulness of ideological variables appears to be greater in studying so-called "elites" or highly politicized groups than for citizen groups. McClosky was able to differentiate Republican from Democratic convention delegates on policy positions, as well as show substantial differences between the policy positions of party leaders from both parties and the rank and file of the respective parties.²⁴ McClosky's findings, nevertheless, revealed significant intra-party differences between party leaders. Thus the question of ideological consensus, and its presumed impact on convention decision-making has yet to be empirically demonstrated.

Data in Table 11 show that ideology and can-

²³ See David W. Minar, "Ideology and Political Behavior," *Midwest Journal of Political Science* 5 (November, 1961), 317-331; and Phillip E. Converse, "The Nature of Belief Systems in Mass Publics," in *Ideology and Discontent*, David Apter (ed.) (New York: Free Press, 1964), pp. 206-261.

²⁴ See Herbert McClosky, *et al.*, "Issue Conflict and Consensus Among Leaders and Followers," *American Political Science Review* 54 (June, 1960) 406-427; and "Consensus and Ideology in American Politics," *American Political Science Review* 58 (June, 1964) 361-379. In addition to McClosky's studies which dealt with positional issues, a host of other studies too numerous to list here have found ideology to be correlated with political decision-making.

TABLE 11. IDEOLOGY AND CANDIDATE PREFERENCE

Candidate Preference	Conservative (N = 26)	Moderate (N = 44)	Liberal (N = 100)
Humphrey	58%	81%	44%
McCarthy	0	3	34
Other*	32	16	22
	100%	100%	100%

$X^2 = 33.6$, $P > .01$.

V (Craemers V) = .32.

* Kennedy, McGovern and favorite sons.

didate preferences are strongly related. The more liberal respondents supported McCarthy while the more conservative favored Humphrey and other candidates. Given this finding we again turned to our primary interest in amateurism, which has previously been shown to be virtually unrelated to liberalism-conservatism (see Table 7). Therefore, we hypothesized that amateurism represented a variable that could predict candidate preferences independent of ideology. Table 12 shows the correlation coefficients between amateurism and candidate preference controlling for ideology, and ideology and candidate preference controlling for amateurism. This procedure is essentially a partialing process assuming nominal level measurement of the variables. The capacity of both amateurism and ideology to predict candidate preference independent of each other is demonstrated by the substantial V values that remain when controls are imposed. When amateurism and ideology are combined, the multiple association with candidate preference increases ($V = .63$).

To recapitulate, the liberal amateur delegate was the most typical supporter of McCarthy, while Humphrey's most consistent supporters were conservative professional delegates. Amateurs are not necessarily liberal. They were ranked as conservatives almost as often as professionals. We have shown in Table 12 that ideology and amateurism are significantly and independently related to candidate preference.

IV. CONCLUSIONS

James Q. Wilson, whom we have relied upon for our conception of the amateur Democratic delegate, has suggested that "It is not age, education, or class that sets [the amateur] apart and makes him worth studying . . . Rather, it is his outlook on politics, and the style of politics he practices."²⁵ Our results are in general

²⁵ Wilson, *op. cit.*, p. 2.

agreement with Wilson's earlier description. We have inferred from our findings that the amateur's outlook on politics is determined, in part, by his later (adult) socialization experiences. We have suggested the ways in which the earlier (childhood) socialization experiences of the professionals may have contributed to their concern with party unity, their willingness to compromise and their primary desire for electoral victory. Further, we have suggested that the political socialization process cannot be evaluated in terms of crude background characteristics such as age, education and income. Finally, we have identified two dimensions of candidate appeal. First, we have shown that the perceived policy position of the candidate, defined along a liberal-conservative continuum, were an important determinant of his appeal to convention delegates. The second dimension, and the dimension we have been most concerned with, which we have labeled amateurism, has been shown to have a significant impact on candidate preference— independent of ideological or policy concerns.

Commenting on the relationship between ideology and amateurism, Wilson has stated:

. . . it is not their liberalism that is their chief distinguishing characteristic. They [amateurs] can

be found in the Republican party as well, and there they are likely to be extremely conservative. What is necessary is a definition that distinguishes the new [amateur] from other politicians but which is applicable equally to liberal and conservatives.²⁰

²⁰ *Ibid.*, p. 2. It is interesting to speculate about the extent of amateurism present among Republicans especially when we recall the Goldwater nomination in 1964. See for example, Aaron Wildasky, "The Goldwater Phenomenon: Purists, Politicians

Perhaps the most important result of this study is that we have successfully operationalized a definition of amateurism which is drawn largely from Wilson's earlier work. Beyond this, we have demonstrated that this measure meets the criterion Wilson suggested, i.e., it is not related to ideology and, to that extent, represents an important independent dimension of political decision making and candidate appeal.

and the Future of the Two-Party System," *Review of Politics*, 27 (July, 1965), 386-413.

IDEOLOGY AND PRAGMATISM: PHILOSOPHY OR PASSION?

JOHN P. DIGGINS

University of California, Irvine

In "Politics, Ideology, And Belief Systems"¹ Professor Sartori has undertaken the Sisyphean task of drawing up conceptual schemes to distinguish the political mentalities of the pragmatist and the ideologist. His "Hypothesis" poses the curious proposition that "ideology and pragmatisms qua 'political cultures' are related, respectively, to the 'cultural matrixes' rationalism and empiricism." (p. 402) When political scientists put forth hypotheses, students of history are usually not far behind with their arid facts and pale negations. Sartori's hypothesis is an intriguing theoretical formulation of a central issue in twentieth century politics; whether it is historically valid is the concern of this article. For the question that remains uppermost as I read his article is simply who are the ideologists and who are the pragmatists? Historically considered, if we were to apply Sartori's defining characteristics to a specific context it may very well be that the totalitarian "ideologies" of communism and fascism would have to be judged "pragmatic," while the mentality of American political behavior may even have to be considered "ideological." Since I am sure Professor Sartori did not have this ironic interpretation in mind, perhaps some elaboration is in order.

When Marx turned Hegel on his head he not only gave a materialistic base to German idealism but imputed an activist impulse to political theory. Dialectical materialism is the "actualization of philosophy," the extension of contemplative thought into real life. And whether regarded as a "knowing-process" or as Sartori's "belief system," Marxism represented a rejection of both the deductive rationalism of Descartes and the sensationalist rationalism of Locke.² In this respect I doubt if Marxism—which Sartori cites as "the outstanding current example" of an ism conceived in a "cultural area qualified by the notion of rationalism" (p. 402)—can be subsumed under his following syndrome of "rationalist ideologies":

The *rationalistic* processing-coding tends to ap-

proach problems as follows: i) deductive argumentation prevails over evidence and testing; ii) doctrine prevails over practice; iii) principle prevails over precedent; iv) ends prevail over means; and v) perceptions tend to be 'covered up,' doctrine-loaded, typically indirect. Hegel's famous sentence 'the rational is real' goes to the very heart of the rationalistic mind, for the rationalistic attitude is to argue that if the practice goes astray, there must be something wrong with the practice, not with the theory. (p. 402)

This is a tidy list of mental traits but I fail to see where it applies to the communist as an ideological personality. More specifically, a Marxist who accepted Engel's bastardization of dialectical materialism and evolutionary positivism would have to deny many of these very dualisms.³ And a Marxist who followed Lenin's advice would have to accept a code of conduct that would be decidedly empirical, concerned primarily with realizing doctrine not through deduction but through action, with unifying theory and practice and joining means and ends. Sartori tells us that "Oakeshott equally makes a good point when he writes that 'Rationalism is the assertion that . . . practical knowledge is not knowledge at all.'" (p. 402) Significantly, Lenin made a similar assertion when he attacked the "rationalist" Machists, whom he mistakenly believed to have been foreshadowed by Berkeley, Hume, and Kant, and then went on to emphasize the overriding importance of practice as the sole criterion of knowledge.⁴ Since the kernel of Marxist epistemology is "*praxis*," it would seem that for a communist practical knowledge is the only real knowledge. Cognitively, then, Marxism as a system of thought would have to be judged "empirical" rather than "rationalist." Translated into politics, it is this empirical or "scientific" nature of Marxism which probably ac-

counts for communism's highly pragmatic and opportunistic mode of action; and, it seems appropriate to add, it was this "experimental" ethos which explains the "Americanization of Marxism" by the Old Left of the thirties, especially by those intellectuals who were nurtured on the pragmatism of John Dewey.⁵

In the example of fascism it is also difficult to understand how ideology and pragmatism can be treated as "polar opposites." Can fascism, particularly "classical" Italian fascism, be interpreted as indicative of a "rationalistic" state of mind and thus a doctrinal ideology? To answer this question we merely have to go to the horse's mouth itself, to the famous essay "The Doctrine of Fascism" signed by Mussolini but probably ghosted by Gentile. Here we are informed that fascism is not a doctrine of words but "an act of life" whose "pragmatic veins" are "its will to power" and "its will to be."⁶ Similarly, Gentile elsewhere maintained that fascism was opposed to doctrinal reasoning because "intellectualism" meant "the divorce of thought from action, of knowledge from life, of brain from heart, of theory from practice."⁷ By breaking down the anti-naturalistic dualisms between thought and action, fascism became something of a mirror-image of Marxism. But fascism actually went further than Marxism in demanding that action prevail over theory, in making practice a transcendent end in itself, an ecstatic "premise" in the case of Italian fascism, a sublime "fulfillment" in the case of German National Socialism.⁸ Clearly fascism represented at once an amalgam and distortion of various philosophical traditions; nevertheless it strains historical credibility to regard the fascist mind as a rationalistic mentality in which theoretical knowledge is paramount. On the contrary, Italian fascism conceived itself as an endless movement unencumbered by any teleological fixations, an adventurous experiment in which the only approach to political

knowledge must be pragmatic. After all, Mussolini claimed William James as one of his leading "mentors."⁹

Carrying this admittedly brief survey up to date, one may also wonder how the "New Left" can be categorized under the rubric of "rationalism." For the New Left reason is the enemy, doctrine is a delusion and theory a snare. It hardly needs to be pointed out that the political mood of the rebellious young is based on emotion and spontaneity, a "soul politics" where style substitutes for content and engagement for inquiry. Professor Sartori states that "an important feature of the ideological mentality that neatly flows from its rationalistic matrix is that the central elements of an ideological belief system are necessarily 'ends,' not 'means.'" (p. 403) This generalization is doubly ironic. For aside from the existential subjectivism of today's youth—which defies Sartori's philosophical points of reference—it seems fair to say that the New Left's demand for sheer power rather than specific program reveals a concern for means rather than ends, and that its tactic of confrontation politics suggests an interest in the innovating forms of protest rather than in the deductive content of thought. Can this recent and, in historical perspective, totally unanticipated phenomenon of radical dissent be explained as an expression of the axiomatized rationalism which Sartori believes is the mark of the ideological psyche? Indeed the irony is compounded as we stop to consider that when the anti-ideological liberal opposes the desperate antics of the New Left his characteristic response is: "I agree with your goals but not your methods." If the liberal and radical do agree on common ends (a skeptical assumption at best) and differ only on means, what remains of the distinction between the "pragmatist and "ideologist"?

Apparently Professor Sartori's answer to this question is provided in the second section of his essay where he draws the distinction between ideology as a mentality and ideology as a passion. In many ways this is the most convincing part of his article; yet I am still in doubt as to how ideological mentalities and ideological emo-

⁹ William K. Stewart, "The Mentors of Mussolini," this REVIEW, 22 (November, 1928), 843-869. Although the pragmatic content of Italian Fascism appealed to American liberals, Stewart's claim that Mussolini was familiar with James's philosophy is doubtful. See this author's "Flirtation With Fascism: American Pragmatic Liberals and Mussolini's Italy," *American Historical Review*, LXXI (January 1966), 487-506.

tions relate to one another. Discussing the "emotive status" of the ideologist and the pragmatist, Sartori argues that the former's "belief system" is based on "fixed elements" deeply held by a "closed cognitive structure," while the latter's is based on "flexible elements" loosely held by an "open cognitive structure." (p. 405) But here we are dealing with personal inclinations and social awareness, with inner passion and external perception; in short, with nothing less than morality and mind, axiology and epistemology. Sartori admits that "beliefs are inextricably value-laden—they precede the analytical distinction between value and fact"; and because of the unresolvable predicament in value theory he states that "I propose to search for structural elements of differentiation bearing on *how* one believes." (p. 401) By focusing on the "how" Sartori is content to describe the process of belief, not its purpose; and by concentrating on "how" he avoids the more telling question of "why" people believe what they believe. The upshot is that since Sartori is not interested in the intellectual or psychological genesis of belief he is unable to show a precise causal relationship between his philosophical categories and his political patterns of behavior. As such, the argument is neither logically compelling nor empirically convincing. Why, for example, should a "rationalist," who supposedly derives political knowledge from universal truths and values which are grasped only by reflection, be any more prone to ideological extremism than an "empiricist" who, assuming values "given" in the natural world, realizes political knowledge not in reflection but in action? In short, if Sartori's categories are to have any validity the questions we must ask are essentially these: Is there some inner-connection between ideology and rationalism on the one hand and pragmatism and empiricism on the other? Can social beliefs be inferred from philosophical dispositions? Does metaphysics govern politics?

Such issues, of course, are only implicitly germane to Sartori's contemporary study, and it would be petty to criticize him for not addressing his learned essay to these unanswered questions in intellectual history. But one purpose of the present essay is to suggest that historically the affinity between philosophical mentalities and political beliefs is not as simple as Sartori's models imply. If we followed Sartori's conceptual illustrations we would be hard pressed to explain why similar philosophical systems of reasoning have led to diametrically opposite political conclusions. To cite a familiar example, if philosophy shapes politics how can we explain why John C. Calhoun was able to draw upon an

empirically-reasoned, Marxist analysis of history and society and arrive at a comprehensive, ideological defense of slavery?¹⁰

Perhaps the riddle could be explained if we acknowledged that political commitments are more often based on personal ideals and value judgments that are not logically tied to philosophical schools of thought. But in Sartori's analysis, confined to "*how* one believes" rather than "*why*," there is no dialectical interplay between thought and values. As a result we remain in the dark as to the motives of political beliefs. About all we can legitimately infer is that the possession of a similar philosophical mentality is no guarantee that the mode of political behavior will likewise be similar. This was the conclusion reached by the doubting-Marxist Henry De Man, who nearly a half century ago declared: "Socialism is a *passion*, not a *cognition*."¹¹ It is precisely this personal dimension, this mystery of character and ethical intuition, this sense of the human mind responding to a concrete situation, that is lacking in Sartori's analysis. Without this inner-dimension and external context I fail to see how we can fully understand anything about the behavior of an ideologist or a pragmatist from the anonymity of abstract models. Moreover, in light of the recognition on the part of both American pragmatists and European Marxists that value judgments cannot be deduced from empirical evidence,¹² it is difficult to accept Sartori's hypothesis that the empirical mentality distinguishes the pragmatist from the ideologist. Rather than resort to the matrixes rationalism and empiricism, it seems more valid to suggest that it is not the philosophical meth-

To a behavioralist, of course, the fact-value dichotomy is a non-problem since ideology serves to "rationalize" value-selection whereby "the cognitive conviction of truth and 'moral' conviction of rightness are merged." (Talcott Parsons, *The Social System* [Glencoe, Ill., 1951], 351.) But Sartori rightly rejects this functional description of ideology as "far too broad" and "almost nil" in its discrimination of the "value dimension" of behavior. (p. 400)

od of thought but the overwhelming power of moral vision, psychic turbulence, identity anxiety, or social malaise that determines cognitive tendencies and world outlook. Sartori acknowledges the function of "ideological heating," but since he offers no causal explanation of this emotional factor it is impossible to understand why ideology waxes and wanes. Why do embedded values subtly erode away? Why should a crisis of conscience suddenly erupt? Why the "alienation" of the intelligentsia? If we could answer these questions we might begin to understand why the ideologist is "loosed upon the world/full of passionate intensity" and why the pragmatic "centre cannot hold." These are crucial questions for political scientists and historians, as well as psychologists and poets.

Of course "why" problems may be regarded as the agony of the historian, not the political scientist. Yet it seems that Sartori promises more than he delivers. Although he states that "for the present enquiry ideological doctrines are givens" (p. 399), he also admits that ideology "does belong to the concepts that are supposed to have broad and far-reaching causative significance. Hence, if the eminence attributed to the notion of ideology is justified, it must be justified because the term *explains*, not merely because it abridges and/or provides a regressive stopper. Therefore, as the discussion proceeds the focus will be progressively shifted to the *explanatory value* of the various meanings of ideology, for my ultimate purpose is to probe and single out the conceptualizations that are cognitive instruments, that do have explanatory-causative potency." (p. 400) As one follows Sartori's figures and quadrants (up to and including number six on the "End of Ideology Hypothesis") it is hard to tell where the "regressive stopper" is unplugged and when the "explanatory-causative potency" begins to flow. For example, Sartori's graphic illustrations apparently are designed to establish the conditions under which the "end of ideology" will be realized. To fulfill these conditions Sartori argues that it is not so much the emotive but the cognitive status that must change from (I) "fixed elements [which] are rigid, dogmatic, impermeable to argument and evidence," to (III) "firm elements [which] are firmly held, but are open to evidence and/or argument." (pp. 404-406) According to this pattern, would Mussolini's transition from doctrinal socialism to dynamic Fascism be interpreted as presaging the end of ideology? Similarly, would not Stalin and Togliatti, who were always willing to adapt theory to new evidence, have to be regarded as "pragmatic," while Wilson and Roosevelt, who possessed "fixed" ideas about Europe's political future, have to be characterized as "ideological"?

And how would we include in this "explanatory-causative" schema Lenin and Lincoln? Can Sartori's distinction between ideology and pragmatism explain their paradoxical behavior? Lincoln, who opposed Polk's precipitating war by sending troops into a disputed territory and then himself dispatching troops to disputed Fort Sumter; Lenin, who used war to seize power in the name of world revolution and then withdrew Russia from the war thus adhering to the very "revolutionary defensism" he previously denounced; Lincoln, who was passionately devoted to individual freedom and yet forced to suppress civil liberties for reasons of military expediency; Lenin, who with equal passion called for "no enemies on the Left" and then crushed the Kronstadt anarchists for the sake of revolutionary success. Both leaders, it would seem, could operate with "fixed" historical "ends" in mind and yet respond to the flux of experience and change with the course of events while at the same time trying to guide events. To be sure, the comparison is superficial: Lincoln desired to conserve a country by restoring the union; Lenin wanted to transform the world by realizing the revolution. Nevertheless, it is extremely difficult to use Sartori's models to judge who was the rationalist and who was the empiricist for the simple reason that both men brought human will to bear upon history not merely by comprehending it but by trying to change it. And in a sense both were successful. They correctly read the movement of history and thereby emerged victorious over their opponents. Is then the pragmatic thinker by definition the historical victor, the one whose very position proves that his ideas had accurately gauged the pace and direction of history? Whatever the answer to this question, Sartori's categories are of little help. Indeed, when one tries to compare the actions of an "ideologist" like Lenin to a "pragmatist" like Lincoln the meaning of political pragmatism begins to seem like nothing more and nothing less than the content and agony of men in power.

Sartori's distinction between rationalism and empiricism also explains very little about the vaunted pragmatism of American liberalism. Empiricism as a scientific philosophy may have inspired a pragmatic mentality, but the intellectual groundwork of American politics was nourished in a "cultural matrix" that would have to be described as rationalistic. One need only peruse *The Federalist* to appreciate the extent to which the axioms of Newton and the "maxims of geometry" influenced the Framers.¹³ Moreover,

¹³ The best expression of these deductive axioms is in Hamilton, *The Federalist*, No. 31; for a per-

throughout much of our history the American mind was paralyzed by such concepts as natural law, rationalistic theories that were later transmuted into scientific laws like Social Darwinism. It is true that a school of pragmatic philosophers ultimately revolted against this abstract "formalism" in American thought, but the naturalistic metaphysics eventually developed by America's most influential philosopher, John Dewey, had the effect of obscuring the very dualisms which Sartori believes to be the defining earmarks of rationalism and empiricism, and hence of ideology and pragmatism.¹⁴

To be more precise, let us return to Sartori's categories. His hypothesis maintains that "the rationalistic attitude is to argue that if practice goes astray, there must be something wrong with the practice, not with the theory"; whereas the "empirical attitude is to argue that if the practice goes astray, something is likely to be wrong with the theory, not with the practice." (p. 402) This is a well-wrought distinction; but once again, how are we to apply the model to pragmatism where, as Dewey emphasized, there is no fundamental dualism between ordinary practice and prescriptive theory?¹⁵ And how are we to apply it to American history where, as Daniel Boorstin has argued, it was assumed that all theoretical speculation was needless since the descriptive (the "is") and the normative (the "ought") fused into an unspoken national faith in the "givenness" of values?¹⁶ Indeed, can we apply Sartori's model to America's past political behavior? Can it be argued, for example, that when political practice went "astray" during a crisis as profound as the Civil War Americans

questioned the "theory" of the republic?¹⁷ Have Americans ever seriously challenged the theoretical foundations of their government? On the contrary, when practice seems to deviate from theory Americans have shown a tenacious capacity for either reaffirming earlier theoretical ideals or for creating myths and symbols to reconcile the contradictions between the mundane exigencies of practice and the hallowed images of theory.¹⁸

Giovanni Papini once observed that pragmatism is a philosophy of doing without a philosophy. In politics it could be said that pragmatism is a theory of doing without a theory. And without a sense of theory how can the political pragmatist discern whether it is practice or theory that has gone "astray"? Indeed, inasmuch as the pragmatist assumes that ideas are immanent in the texture of experience, that precedent gives rise to principle, that ends are embodied in means, and that theory is implicit in practice, one can only conclude that pragmatic behavior embraces both of Sartori's rationalistic and empirical paradigms. Applied historically and examined philosophically, Sartori's models are operationally meaningless.

¹⁴ No major American political thinker reexamined the theoretical assumptions of the federal republic as a result of the Civil War crisis, at least not in the terms Sartori has laid down. While southern legalists like Alexander Stephens appealed to the Constitution to vindicate the cause of secession, northern statesmen like Lincoln appealed to Providence only to discover that the causes of the war remained inscrutable—"The Almighty has his own purposes." (See Edmund Wilson, *Patriotic Gore: Studies in the Literature of the American Civil War* [Galaxy edition, New York, 1966] pp. 99-130, 380-437.) At the same time many intellectuals blithely welcomed the war as a purification of the body politic—Whitman even drew upon Hegel to rhapsodize about a "general soul" that would reveal itself dialectically through the struggle of opposites. (See George M. Fredrickson, *The Inner Civil War: Northern Intellectuals and the Crisis of the Union* [New York, 1965].)

¹⁵ The value conflicts, moral antinomies, cultural tensions, and political contradictions between belief and behavior in the history of the American mind have been explored in the works of John Higham, R. W. B. Lewis, Leo Marx, Marvin Meyers, Charles Sanford, Henry Nash Smith, and William R. Taylor. For a review of a portion of this scholarship, see David Brion Davis, "Some Recent Directions in American Cultural History," *American Historical Review*, 73 (February, 1968), pp. 696-707.

Historically, past experience may very well show that Sartori's formulations result in a paradox. Can a people enjoy a pragmatic political culture and at the same time question the theoretical basis of its political system? Would not much constant scrutiny force the public into interminable debates over the proper "ends" of government, into the divisive issue of *telos* instead of the innocuous matter of technique? If American history is any guide, the record seems to suggest that only when a society takes its "ends" or "theory" for granted can pragmatism flourish. In this respect pragmatism means the cessation of theoretical reflection and the mystification of process as an end in itself. Studying this mindless, anormative behavior, Louis Hartz concluded that America's "irrational Lockianism" became "one of the most powerful absolutisms in the world."¹⁹ Indeed to have a reciprocal dialogue between theory and practice might require an intense degree of social or cultural conflict, the presence of those very elements who would challenge the political foundations of society by articulating fresh values and outspoken ends, thereby undermining the pragmatic consensus. Hence the paradox of Sartori's empirical syndrome. Hence, too, the dilemma of political pragmatism: a consensualized society cannot analyze itself in view of theoretical norms without ceasing to be pragmatic; without, that is, ceasing to believe that values are "given" in the nature of experience.

Philosophically, Sartori's argument is also questionable. For it is possible that pragmatism and Marxism alike overlap the distinction between rationalism and empiricism since both Dewey and Marx never quite shook off Hegel's influence. Dewey recalled that "Hegel's thought . . . supplied a demand for unification that was doubtless an intense emotional craving, and yet was a hunger that only an intellectualized subject-matter could satisfy. . . . Hegel's synthesis of subject and object, matter and spirit, the divine and the human, was, however, no mere intellectual formula; it operated as an immense release, a liberation."²⁰ Marx also drew upon Hegel to absorb the classical conflicts of philosophy, the dichotomies between thought and action, being and doing, theory and practice.²¹ Because both the pragmatist and the Marxist (and

the pragmatically-oriented fascist like Gentile) share Hegel's anti-dualist assumptions, Sartori's distinctions between rationalism and empiricism are of little value in explaining either ideological or pragmatic behavior. Sartori writes that "the ideologist cannot have it both ways, he cannot claim at the same time an intellectual and a practical primacy." (p. 402) Why not? To the extent that a pragmatist and a Marxist believe that knowledge is realized in action and theory fulfilled in practice, there is no reason why they both cannot claim the best of all epistemological worlds.

The ideologist and the pragmatist can claim not only a common epistemological premise but a common ontological premise as well. Years ago Mannheim was the first, I believe, to notice that the controversy over ideology brought about "a decisive turn in the formulation of the problem of reality." When the ideologist was accused of entertaining only utopian visions he was forced to demonstrate his ideas were useful and consequential in the real world. For once it was granted that ideas could be "regarded as futile when it came to practice," it followed that "the only reliable access to reality is to be sought in practical activity." Ironically, the concept of ideology negated itself as the ideologist came to accept a pragmatic definition of reality. The locus of political reality thus shifted from contemplation to realization, and the ideologist himself soon forsook the life of theory and became caught up in the debate over practice. Thereafter the validity of political ideas was no longer solely a matter of ends but also of means. And since even the ideologist would have to prove his wisdom in the realm of experience. "The inevitable and appropriate outlook" for "modern man" became that of "pragmatism."²²

Not long after Mannheim made this shrewd observation the pragmatist Dewey and the Marxist Trotsky debated one another. Significantly, Dewey agreed with Trotsky that "increasing the power of man over nature" and abolishing the "power of man over man" was the proper "*end-in-view*," but he disagreed over the "*means that are judged to be most likely to produce that end*."²³ Accepting Trotsky's thesis

²³ This debate, which first appeared in the *New International* in 1938, has been reprinted in the pamphlet *Their Morals and Ours: Marxist Versus Liberal Views on Morality*, ed. George Novack (Merit Publishers, New York, 1966), 57.

on the "interdependence of ends and means," Dewey also endorsed the Marxist position on the historical relativity of morality by admitting that "the only alternative position to the idea that the end justifies the means is some form of absolutistic ethics." But what Dewey objected to was the assumption that the specific strategy of "class struggle" could be deduced from the universal goal of human liberation. Now insofar as Dewey charged Marxism with the "Hegelian" notion that empirical means could be derived from moral ends, Sartori may take some satisfaction in his rationalist paradigm. In this connection, however, three comments seem appropriate. First, the charge had little foundation in Trotsky's "empirical" reading of Marxism, a reading which offered "no such automatic answers" to the problems of ends and means since only the "living experience of the movement under the clarification of theory provides correct answers to these problems."²⁴ Second, the major thrust of Dewey's critique was to accuse Marxists, and rightly so, of relying on "historical laws" as a guide to social action. The "assumption of a *fixed law* of social development is not relevant" to the issue of means and ends, wrote Dewey.²⁵ In this respect the American philosopher was not attacking Marxism for its rationalistic mentality but for its pseudo-scientific empiricism and positivism. Finally, Trotskyists themselves were just as disposed to reason pragmatically when they accused American pragmatists of becoming "hypnotized by abstractions" in their puristic "search for truth." Using Dewey's own vocabulary, the Trotskyists declared: "Simply to claim 'we seek truth' is not enough. Even in the highly developed physical sciences, the concept of truth, the adoption or rejection of the whole method of inquiry, must be in the end related to the purposes which the inquiry is designed to serve. . . . Historical and political inquiries do not occur in a social vacuum; they are immediately and crucially related to the political ends and aims of individuals, parties and classes, and function actively as weapons in the political struggle."²⁶

This illuminating encounter between American liberals and Marxists, between pragmatists and ideologists, suggests that Sartori's paradigms must be qualified by Mannheim's prescience. For when we observe both sides maintaining that their opponents are "mystical" and

"abstract," and both sides professing to be "empirical" and "historical"; and when we see that the debate was essentially over means, over scientific method rather than moral ends; and when we note that each group used the language of instrumentalism and claimed their rivals were blinded by the concepts of rationalism, then the only conclusion to draw is that Mannheim shrewdly predicted that "pragmatism" would be the "inevitable and appropriate outlook" in modern political dialogue.

Assumptions can move models as well as mountains. Professor Sartori's hypothetical assumptions were constructed in the inviting spirit of "awaiting contrary proof." (p. 399) Whether he regards historical evidence and philosophical argument as sufficient proof remains to be seen. Nevertheless, after defining ideology as a rationalistic mentality it was curiously ironic that Sartori himself proceeded to study ideology rationally; that is, to set up conceptual models from which patterns of behavior are to be deduced with graphic-like precision. Given the intractable nature of the subject it would seem that when an over-arching word like "ideology" fails us, and when the concept itself resists systematic analysis, perhaps our only recourse is to study the history of the idea in all its manifestations and try to discover whether the various concepts of ideology have had any binding effect on political conduct.²⁷ Turning to history, of course, inevitably means focusing upon the rich tapestry of the particular and unique; the existential situation where, as historians and political scientists have learned from novelists, political behavior may be penetrated in its full individuality and ambiguity.²⁸

But even granting Sartori's methodological premises, the crux of my reply is to suggest that the matrixes rationalism and empiricism are, when applied to the historical "ideologies" communism and fascism, more apparent than real; and that the absolute polarity ("polar opposites") between ideology and pragmatism is, when considered in view of Sartori's criteria and in light of the historical record and philosophical

²⁴ For a masterly synthesis of the various historical expressions of ideology, apart from its behavioral implications, see George Lichtheim, *The Concept of Ideology and Other Essays* (Vintage edition, New York 1967), pp. 3-46.

implications, more modelled than true. Too often, I'm afraid, we American pragmatists tend to regard an ideologist as anyone on the wrong side of the barricades. Sartori's otherwise insightful study does little to clarify the situation. The very word itself is so shot through with terminological confusions and semantical traps that it has almost ceased to have meaning in political discourse.²⁹ What to do? Perhaps we should ei-

ther develop a new vocabulary and a new set of conceptual tools to distinguish the pragmatist from the ideologist; or, in the ecumenical spirit of "awaiting contrary proof," admit that we are all pragmatists and we are all ideologists.

cites regarding this problem, see also the debate among Daniel Bell, Carl J. Friedrich, and George Lichtheim in the *Slavic Review: American Quarterly of Soviet and East European Studies*, XXIV (December, 1965), 591-621.

COMMUNICATIONS

TO THE EDITOR:

I hesitated before writing to comment on the review of my book by Professor Macridis and Mr. Schell (this REVIEW, March 1970, pp. 234-235) on the grounds that reviewers are entitled to their opinions and should not have to anticipate dealing with howls of rage from the authors impaled. I decided to allow myself the luxury of reply because my complaint has less to do with the opinions of the reviewers than with the description they provide of what I say.

According to the review, I think that industrialization and affluence "induce inevitably" a decline of ideology, that political cleavages have "dissipated," that people vote on the basis of "increased knowledge." It is stated that I accept generalization about industrial societies "*in toto*," and that I "believe that the end of Ideology had come." Thereafter, I am accused of a "somewhat uncritical application of the 'decline of ideology' theory."

A capsule summary of what is already a survey of a wide range of materials is a hazardous business. To review what is already a review of some very controversial theses must be all the more trying. Nevertheless, this is a caricature that I cannot leave unchallenged.

My book was conceived as an attempt to assess the claims of the end-of-ideology/depoliticization/growing-consensus literature in a case study of a recalcitrant subject: France. I tried to look at countertrends, to distinguish a variety of groups, to avoid statements about inevitability and the foolish notion that all visible trends were likely to point in the same direction. I emphasized the particularities of the French case and said they might indefinitely impede the kind of political arrangements that had arisen elsewhere in the West.

The book in question, *Political Change in Contemporary France*, is, indeed, more sanguine about prospects for political stability than is currently fashionable, though it makes many qualifications unmentioned by the authors of the review. In

particular, it does not come down in support of many of the most familiar "decline of ideology" arguments, arguing that abstraction will become *more* apparent in the political thought of contemporary Western nations, that the Communist Party shows no sign of disappearing in France, that while there are signs of change, the style of politics in France is not yet very different from what it was, though some issues have declined in salience, that depoliticization has not occurred.

Unfortunately, the reviewers' interpretation of the character of the book leads to their treating it as though it were a polemic, which it was not meant to be. This affects the tone of the review. For example, we are informed that "Waterman discovers in his Epilogue a student subculture," whereas the subject is dealt with, even emphasized, in earlier chapters as well.

The book undoubtedly raises some difficult intellectual issues and has provoked disagreement elsewhere on substantial questions of political sociology (See Frank E. Myers, "Social Class and Political Change in Western Industrial Systems," *Comparative Politics*, 2 (1970), 389-412.). I would hope that future debate will also center on the important questions of social structure, political protest and socio-political change in the West and not on the dead horse of whether or not there has been an "end of ideology."

HARVEY WATERMAN

Douglass College, Rutgers University

TO THE EDITOR:

Professor Waterman has written a good book and the review Mr. Schell and I wrote indicates that we thought so. He is unduly sensitive to the caveats and qualifications that a reviewer has the right—justly or unjustly—to bring forth. I do not think the matter calls for a long reply—the whole subject related to the "decline of ideology" continues to lend itself to many misunderstandings both for authors and reviewers!

BOOK REVIEWS

The Ruler's Imperative: Strategies for Political Survival in Asia and Africa. BY W. HOWARD WRIGGINS. (New York, Columbia University Press, 1969. Pp. 275. \$10.00)

Howard Wriggins has written "An Advice to Princes in the New States". He deliberately avoids effort at "grand theory" and "inclusive schemes", and self-consciously employs a morally neutral vocabulary like his Florentine model. In his own words, his book "... is ... an attempt to look out of the president's or prime minister's window, to see his problems as he sees them. It centers attention on the ruler's search for allies and his effort to rally support for himself so that he can stay in power long enough and with sufficient capability to get certain things done. It assumes that every leader has some choice in the way he tackles his job, for no two leaders would deal with their problem of aggregating and using political power in exactly the same way. It is, in sum, a study of alternative strategies leaders have used in their efforts to gain or to sustain control, and to use that control to effect their will or whim on the polities they 'rule'."

This is a valuable book. It will find its way into courses, both graduate and undergraduate, dealing with developmental problems. It may also find its way to the desks of statesmen and politicians, both in the new nations, and the older ones, who need a lucidly written book of this kind. While it avoids "theorizing", anyone familiar with the theoretical literature dealing with development themes will find in *The Ruler's Imperative* traces of frameworks and concepts which have been formulated in the last ten or fifteen years.

The study begins with an enumeration of the kinds of problems which confront the leaders of the new nations, the kinds of goals which these new elites tend to seek, the significant social groupings and competing elites which constitute some of the materials with which the leadership of the new nations must deal. Wriggins then turns to what he calls eight strategies for aggregating power. These include: one, projecting the personality; two, building an organization; three, promoting an ideology; four, rewarding the faithful and the susceptible; five, intimidating the opponent and wavering ally; six, developing the economy; seven, expanding or contracting political participation; and eight, using foreign policy. In the final chapter he deals with the problem of the interdependence of these strategies, conflicts among them, strategic mixes,

how these strategic mixes can contribute to short and long-run goals, and a few illustrations of the development strategies of a number of leaders in the new nations.

A number of problems arise in attempting to use this book to illuminate problems of development policy in Asia and Africa. While Wriggins constantly refers to the variety of kinds of nations in Asia and Africa, he never breaks them down into groupings which would significantly effect the kinds of policy options which leaders in the new nations have. Here he diverges from the Machiavellian model which offers special advice to the rulers of hereditary, conquered, civil, ecclesiastical and mixed principalities, among others. The seventy-odd countries which are to be found in the various parts of Asia and Africa differ radically one from the other according to their size, level of economic development, the complexity of their traditional cultures, ethnic and linguistic composition, previous colonial and political experience, proximity to cold war conflicts, and other aspects of *fortuna* and *necessita*. Needless to say, these gross differences in the characteristics of the many nations about which Wriggins is generalizing effect the kinds of goals that the leaders of these nations can reasonably seek, and the strategies and strategic mixes which are appropriate for these goals. From this point of view Wriggins has seriously over-generalized his advice to princes. Sorting these countries out by relevant variables and combinations of variables would enable us to locate the particular country or kind of country which concerns us in an appropriate class or type. This would have made it possible for us to speak with more focus to the question of developmental goals and strategies.

The treatment of the notion of strategy and strategic mixes also creates some analytic problems. The eight strategies which Wriggins treats are laid out side by side as though the leaders of the new nation had relatively free choice in selecting among them. Actually every leader of a new nation will have a problem of rewarding the faithful, and intimidating the opponents, developing the economy, doing something about political participation, and developing some kind of foreign policy. While I share with Wriggins his concern with excessive theoretical formalization, just a bit more theorizing, classifying, connecting and differentiating would have helped the leader of the new nation apply these valuable materials and discussions to his own peculiar fate.

In an effort to avoid the deterministic overtones of some of the theory in the developmental field, he has exaggerated the freedom of political leaders in the new nations. The demonstration effects of the modern world and the diffusion of products and ideas across borders, the cultural level, economic resources, social structure and political organization in particular countries all have the effect of defining and limiting options. A realistic advice to princes would have to come closer to the real crunches and constraints of everyday life. How much real freedom does a leader have in the choice of form of political organization, extent of political participation, the development of ideology, the use of rewards and penalties, if he chooses a policy of economic development? How much real freedom does he have in the broad area of economic and social modernization? What are the consequences for leadership choices of the rapidly widening gaps between the modern and the non-modern world? Failure to confront these larger issues contributes to a certain blandness of tone particularly in parts III and IV of the book.

It avoids the abstraction of much of the theoretical work in the field. It is full of interesting and valuable illustrations and illuminating anecdotes. The price it pays for this is getting lost in detail, and dealing with problems and processes out of context. But we owe a debt to Wriggins for bringing the important theme of developmental leadership into focus.

GABRIEL A. ALMOND

Stanford University

Politics and the Social Sciences. EDITED BY SEYMOUR MARTIN LIPSET. (New York: Oxford University Press, 1969. Pp. 328. \$7.50; paper, \$2.75.)

This is not the first nor is it likely to be the last symposium on the relations between the study of politics and the other social sciences. But editor Lipset has brought together ten fine essays by distinguished practitioners of cross-disciplinary political analysis. Thus the volume provides a guide to many of the contemporary dilemmas in the field.

Because the authors are conspicuous contributors to both the substantive and polemical literature on the subject there are few surprises. Fred Greenstein and Arnold Rogow find psychology not only useful but essential to the understanding of politics. Scott Greer sees the study of politics as an application of sociological theories, particularly within the context of organization theory. Far more sceptical of the sociological explanations is Giovanni Sartori who argues for a "political sociology" in which political

variables would be given more independent weight than they are in "the sociology of politics." William Mitchell examines his own semi-defection from Parsonian sociology to "political economy" while Mancur Olson demonstrates how truly antithetical economic theory is to Parsonian sociology.

With the exception of Sartori, the authors mentioned see the study of politics on the receiving end of the disciplinary theoretical exchange. There is evident among the political scientists, however, an enhanced self-confidence that studies in the political arena might also improve psychiatry and economics. It is a measure of the theoretical pecking order of the disciplines that the historian Richard Jensen and the anthropologist Ronald Cohen are most concerned with the aid which they can receive from the more systematic political science. The symposium concludes with Hayward Alker's tour of advanced techniques in the use of statistics in causal analysis.

In a symposium of such diversity the points at issue revolve around approaches and theories. No one, of course, finds any theory or method unique to the study of politics. What does differentiate the authors is their thinking on how the social sciences can or cannot be joined. The question is sometimes raised explicitly, but more often it is implicit in the discussion. The dominant viewpoint among the authors and one shared by most behaviorally oriented political scientists is that a natural harmony prevails among the disciplines. As Greer indicates, "... there are really only two basic analytical schemes in the study of human behavior—the psychological and the sociological. . . ; their explanatory theories . . . are cognate." While no single theory reigns, no great difficulty exists in bringing them together. Certainly political scientists have moved blithely from notions of political culture to group theories, role theories, personality theories, communications theories, structural-functional theories, and then to systems theories, all with little intellectual strain. Even when a concept such as the group retreats from its original pretensions as the explanation of all political behavior, it nevertheless remains an important tool in subsequent political analysis. In effect there is a general social science, pluralistic in its explanations, and the study of politics is the application of these explanations in a specific context.

This is the central thrust of Fred Greenstein's well thought-out defense of the use of psychological variables in political analysis. Greenstein recognizes the limitations, but he argues that as long as we can explain the actions of a Wilson or

a Kennedy in psychological terms we must include the psychological interpretation in our analysis. Psychology does not have to explain everything, just something in order to justify its worth to political science. And of course Greenstein is right—in a pluralistic social science all variables deserve equally to be heard and tested.

A strikingly different view is that of the economist Mancur Olson who argues that the social sciences rest on two different and frequently opposing preconceptions and methods. At one pole lies the rational calculus, closely associated with economic theory, but applicable in any situation in which men "have determinate wants or objectives but at the same time do not have so much of the means to achieve these ends that all their desires are satiated." At the opposite pole is the preconception, "... that people do what they are brought up to do," characteristic of the dominant modes of thinking in sociology and psychology (and one might add political science). The latter preconception finds its explanations of political behavior by studying how wants are derived. The former focuses on the means by which wants are satisfied.

I am, of course, oversimplifying what Olson already admits is an oversimplification; nevertheless I think his argument is correct. The differences between rational calculus and social psychology are differences not of subject matters but of method and theory. One can find representatives of both approaches in every social discipline. Those who ask how man's wants arise tend to use diffuse, plural, functional explanations. Those who focus upon the means of satisfying wants tend to work from logical-deductive theories. In political science in recent years there has been a growing literature of game theory, party theory, choice theory, and exchange theory, all of which seek to reduce and hold constant the "want" side of the equation, to explore the logic involved in satisfying a few narrowly defined or assumed political wants.

The importance of Olson's distinction lies in the assertion that rational calculus and the social psychological approach do not blend easily. They tend to produce conflicting not additive explanations. For example Olson dissects the problem of political integration. The functionalist sees political unity as a product of common needs, a consensus of values. The proponent of rational calculus, Olson argues, explains integration as the product of differences, of a situation in which men with different needs and wants find satisfaction in coming together for purposes of exchange.

The extent to which rational calculus and the social-psychological approach are at odds is not

widely understood. The pluralistic assumptions of general social science lead us to expect that the conclusions reached by rational calculus are merely additional variables. Yet this expectation causes social scientists to talk past each other and perhaps past themselves. For example, when V. O. Key raised the possibility that the electorate might be responsible he treated it as a question of evidence, and the subsequent controversy has tended to center upon the evidence. In reality what Key demonstrated was that even where the evidence is the same the rationalist perspective (to which Key was addicted in all his work) leads to explanations opposed to those based on social psychology.

The reactions of Sartori, in the symposium, to sociological explanations of voting are similar to Key's. Although it is not explicitly stated, I think Sartori's scepticism flows from the rationalist bias inherent in politics itself. As much a game of rational calculation as economics, politics calls out for theories of rational behavior. The complaints that contemporary political science isn't about "politics" would be echoed in Economics if that field were to devote itself primarily to the differential spending habits of classes and groups, the economic socialization of consumers and producers, and personality differences among corporate executives. Such questions may be interesting to economists, but only within the framework of rational theory.

It is, of course, possible that the truths of social psychology can be wedded to those of rational calculus to produce a truly unified political or social science. But if theoretical unity is ever to come, we must first recognize how different the two approaches are. By making us sensitive to the differences this symposium makes a real contribution.

Michigan State University

The Role of the Congressman. By ROGER H. DAVIDSON. (New York: Pegasus, 1969. Pp. 220 \$7.00 cloth; \$2.25 paper.)

Roger Davidson's, *The Role of the Congressman*, is one of those few books on the national legislature that can be recommended to both students with a general beginning interest in Congress and scholars with an extensive background in the field. Starting with the same sample survey of 116 members of the U.S. House of Representatives, completed in 1963-1964, that served as the basis for the earlier volume by Davidson, David M. Kovenock, and Michael K. O'Leary, *Congress in Crisis: Politics and Congressional Reform* (Belmont, Calif.: Wadsworth, 1966) Davidson uses the role concept to

develop a relatively comprehensive picture of the Congressman and his environment. The author extends the classification of legislative roles applied by John Wahlke and his associates in their four state survey, *The Legislative System* (N.Y.: Wiley, 1962), to the House of Representatives with frequent comparisons between legislative bodies at these two levels. He integrates in a tightly written and highly readable analysis a wide range of previous studies of the Congress.

Those readers familiar with the Congress will find an accurate, recognizable description of the House, as well as a rich variety of new insights drawn from the survey data. For the newcomer, Davidson's treatment cuts through many of the stereotypes of Congress posing basic value conflicts in the interpretation of Congress. The survey results on Congressional attitudes summarized in an appendix are in themselves a revealing self-portrait of the House.

The overriding conclusion of the study, that "the legislator is a divided soul" as a member of both a prestigious national institution with task- and work-group-oriented norms and as a spokesman for external constituency interests, is not new. Davidson goes beyond this general Insider-Outsider dichotomy of members however to demonstrate "coherent and consistent patterns of role-taking" within the House. He finds for example that "the Tribune is an instructed Delegate, a Local, and a party Loyalist; he is slightly more receptive to interest groups than the average Congressman." In contrast the Ritualist is the classic "House man." His pattern of role cognitions are Trustee, National, neutral toward party and slightly less receptive to interest groups than his average colleague. The author suggests a comprehensive map of role cognitions in his concluding chapter.

The most interesting parts of the analysis are Davidson's explorations of some of the patterns he finds. He suggests, for example, why partisan role orientations decrease with seniority, why Republicans are more district-oriented than Democrats, why purposive and partisan role orientations vary by geographical region. He cautions the reader that the strong local strain among members should not be equated with "parochialism." To the Congressional reformer who prefers competitive seats to safe districts, Davidson notes that "whatever the benefits of electoral competition, it does not tend to produce Congressmen who are Trustees or who are free to take a national view of things. And whatever the vices of safe districts, they *do* tend to produce just such members."

Within the conceptual framework he has adopted and the data available to him, the au-

thor's analysis is carefully and methodically developed. He offers only "a limited perspective drawn from a narrow range of findings." He is aware that he is pushing his data to the limit and sometimes beyond and that his limited sample-size precludes sophisticated multivariate analysis. On the other hand, he tends to accept uncritically the role classifications of *The Legislative System* and to sidestep the question of how role cognitions bear on enacted roles and outputs of the legislative system. Do role cognitions vary for example with issue scope? The author's own estimate of the utility of further applications of role theory would have been instructive.

Davidson raises some interesting questions about trends bearing on Congress that he might have explored at greater length. In a highly suggestive analysis of legislative careers over ten selected Congresses he finds that contrary to expectation, in recent years, the general trend has been toward younger first-term Congressmen and that prior formal officeholding seems to have decreased perceptibly within both parties. One possible explanation is that "the career ladder to Congress has become more distinct from career ladders to other public offices," a point well worth developing.

One of the most important issues raised by Davidson is the relative salience of internal and external role expectations over time. Contemporary Congressmen are more firmly "House men" than their nineteenth century predecessors in his estimate. The implied strengthening of Insider or Trustee and National orientations has been balanced by a secular decline in the competitiveness of districts which has probably served to moderate external role-expectations. Davidson concludes that "internal and external roles are probably in greater equilibrium today than in the past." He acknowledges one potential conflict however. Insofar as we know anything about *public* expectations for the performance of legislators "citizens apparently expect their Representatives to follow instructions rather than exercise independent judgment." This conflict is not normally serious as long as it is limited to a fairly narrow range of issues. If "attentive publics" grow in number and size the duality of the legislative life could become increasingly uncomfortable. Beyond these general observations Davidson does not attempt to project future trends in representation or changes in the size and nature of the Congressional constituency.

The Role of the Congressman is more than a restatement of conventional and non-conventional wisdom about Congress. It is a valuable point of departure for both layman and scholar

as we fashion a contemporary statement of political representation for the American democracy.

JOHN S. SALOMA III
Massachusetts Institute of Technology

Crises in Foreign Policy: A Simulation Analysis.

By CHARLES F. HERMANN. (Indianapolis: Bobbs Merrill, 1969. Pp. 234, \$8.50.)

Hermann presents several models of crisis decision making and tests them against data from an international simulation series and U.S. foreign policy cases. The first model proposes that a crisis is a situation characterized by high levels of threat, time pressure and surprise. While the author defines threat as blocking of goals, his operations in the simulation and participant perceptions seem to suggest that the communication of possible use of force is a more critical semantic aspect of threat.

Hermann argues that this combination of three traits produces unique behavior as opposed to any combination of less than three traits. His analysis proceeds to study behavior in crisis situations as compared with behavior in high threat plus time pressure (with surprise controlled) or other combinations of his traits. In so doing one tends to lose sight of possible interconnections of these factors. One also tends, of necessity, to think of only linear relationships.

For instance, Hermann proposes that crisis induces action. This hypothesis is based on cases and research such as that of North's group; but puts aside work such as McClelland's which strongly suggest that inaction follows crisis. By using the dichotomy—crisis vs. non crisis—Hermann must discount either North's or McClelland's results. However, the simulation results are unclear on action in crisis. He then distinguishes among types of action and hypothesizes that crisis induces hostile and exploratory action but suppresses cooperative action. The simulation data support this hypothesis.

However, it appears that "non-crisis" situations such as those with both high threat and time pressure produce even stronger tendencies to avoid cooperation and to try exploration but have no connection with hostile action. Hermann sees this as supporting the idea that crisis has "unique" effects.

Another approach is to follow Hermann's provocative suggestion that variables in the definition may interact. Using a model of decision process developed by Driver and Streufert ("Integrative complexity: Individuals and groups as information processing systems," *Administrative Science Quarterly*, June, 1969) one can pro-

pose that a) Surprise can be viewed as amplifying threat since no plans for coping with the threat exist and b) short time compresses information, as Hermann notes. In our model information density and threat are jointly termed *environmental load* and interact to induce common effects on the general complexity of decision making systems. This view then would see Hermann's crisis situation as a high environmental load situation. Combinations of threat and time pressure or threat and surprise might be moderate load conditions, while only one trait could describe low load conditions.

This view proposes a curvilinear relation between the complexity of decision making and load. An examination of the types of action reveals that in low load situations, the predominant response to input was *simple* cooperative acquiescence. In moderate load (e.g., high threat plus time pressure) simple acquiescence is avoided, the more complex exploratory response is increased—but simple hostility is avoided. Finally in high load (crisis) the simpler hostility action increases and exploration is less strong.

In the next portion of the book, Hermann suggests that action in crisis will be moderated by intervening variables within the decision unit such as perceptions of hostile intent by the threatening agent. While the conceptualization in these chapters is quite insightful and the case material is well employed, I found some difficulty with the statistical analysis. The statistics compared the incidence of an intervening variable for only cases of action in crisis vs. non-crisis. For instance, the data say that action takers in crisis see the other party as more hostile than action takers in non-crisis. It is not clear that this result means that in crisis (as opposed to non-crisis) *if* the other party is seen as hostile, action is more likely. The data could mean that in both action and inaction cases, crisis induced more perception of hostility than non-crisis, i.e. no necessary connection of hostile perception with action probability. This uncertainty plus the use of the unclear action-in-general variable will preclude any extended review of this section.

In the final chapters, Hermann proposes an ingenious elaboration of his model: crisis increases pressures to act while decreasing evaluations of successful action. A decision taken under such incongruous conditions induces low confidence and a compensating search for support which generates a flurry of communication. The simulation data generally confirms this model. However, here again the use of unrelated traits and dichotomous categories yields some odd results, which might be more meaningful if

examined from an environmental load point of view.

For instance, Hermann argues that crisis produces a decrease in search for definitional information and for alternatives, number of alternatives discussed and amount of participation in the group process. Each of these phenomena can be seen as aspects of integrative complexity in decision process. Complexity will be highest in moderate load and decline in crisis or low load. The simulation data clearly support the curvilinear hypothesis with respect to all variables except amount of participation. Actual participation increased to a maximum under crisis, but subjective perceived involvement declined; suggesting that group integration, i.e. people *influencing* policy as opposed to merely talking, declined in crisis. Thus, all of these factors reflecting integrative complexity do decline in crisis—including effective integrating of people and information, yet the high values of these variables in high threat plus short time situations is not so baffling.

Similar clarifications of puzzling results relating to post decision confidence and search for support in "non-crisis" (moderate load) settings could be presented. However, the above examples illustrate sufficiently the difference between a linear, categoric approach to crisis and a curvilinear, dimensional approach.

Hermann has conducted an exemplary simulation-experiment which yields both provocative findings and a stimulating post hoc model. Exceptional care and insight characterized the design of this study. This simulation had all the usual exciting, motivating characteristics of simulations, all the relevance to actual foreign policy settings, yet was not deficient in control. In fact, each type of threat, surprise and time pressure was introduced in controlled sequences. The data are free of much of the usual complaint that simulation runs are not comparable. Hence, the support derived therein for both Hermann's model and my rudely superimposed model is unusually well founded. This study should be used as a primer for simulation-experiment design.

A final note concerns validity. How far can one generalize from a set of Navy Petty Officers in the Internation simulation? As one answer Hermann well illustrates how Cuba and other cases reflect his hypotheses; and he does point the reader to useful sources (e.g. Guetzkow) on this problem.

M. J. DRIVER

University of Southern California

Theory of Voting. By ROBIN FARQUHARSON.
(New Haven: Yale University Press, 1969.

Pp. 83. \$5.00.)

This short work, which received the 1961 Monograph Prize of the American Academy of Arts and Sciences in the field of the social sciences, has gone unpublished for more than ten years. The delay is most unfortunate, for *Theory of Voting* is an elegant and thoroughly charming little book. It is, in addition, a major contribution, which may well rank among the most important contributions to analytical political theory to date.

The scope of Farquharson's work is relatively narrow; it comes closest to Black's *Theory of Committees and Elections* in this respect. Within this scope, however, it achieves a number of important results and insights. In precision of thought and analytical depth, the work with which it most invites comparison is Arrow's *Social Choice and Individual Values*, yet Farquharson manages to perform his analysis without the somewhat forbidding technical apparatus employed by Arrow; the reasoning, though rigorous, is expressed with clarity and elegance, and is illustrated by numerous examples. (Though a number of unfortunate misprints do mar the exposition.) Understanding *Theory of Voting* will require genuine intellectual effort on the part of the reader; but it will not necessarily require extensive background in technical mathematics.

The central part of the analysis—comprising some 51 pages, many wholly or partly covered with diagrams or footnotes—is an analysis of committee voting. The framework is game-theoretic, the members of the committee being viewed as players in a non-cooperative, n-person game. There are m possible outcomes (such as alternative amendments to a bill, or candidates for a particular office), and n voters, each with his own preference ordering or ranking of the outcomes. Aside from the rather innocuous assumption that there are no ties in any of the preference orderings, there are no special restrictions (such as single-peakedness) on individual preferences. The committee must select one of the outcomes for adoption, and must do so by means of some procedure in which outcomes are progressively eliminated from consideration by a succession of votes, until finally only one is left. Most of the analysis is concerned with *binary* procedures—that is, procedures such that at each stage of voting the committee is confronted with only two possibilities (subsets of outcomes) to vote on. The usual committee procedure for successively voting on alternative amendments to a single bill is a binary procedure in Farquharson's sense. A three-candidate election in a single-member district, on the other hand, would normally

not constitute a binary voting procedure, since under usual electoral arrangements (e.g., simple plurality rule, or absolute majority with runoff), members of the electorate can vote more than two on the first ballot.

Each voter is interested in casting his votes so as to achieve the most favorable final result possible. Only rarely will "sincere" voting be best for this purpose; often a committee member will find it advantageous to vote against an outcome he really prefers, but which has no chance of being adopted, in order to improve the chances of some second-best outcome. Thus in deciding how to vote each member must weigh various possible voting strategies. Typically, there are many such strategies available to the individual voter; with only four outcomes, for example, there will always be at least eight distinct strategies for each member, and depending on the particular binary voting procedure employed, there may be as many as one hundred and twenty-eight. Since the final result depends on the joint strategy choices of all n committee members, the number of contingencies to be considered is substantial, and the strategic calculations facing the individual voter as he attempts to determine his "best" strategy are hardly trivial. Indeed, in game situations of this sort, it can easily happen that there is no "best" strategy—as in a two-person zero-sum game which has no saddlepoint.

As Farquharson shows, there are indeed "best" strategies for committees employing binary voting procedures, which are "best" in the sense that when all members of the Committee employ their "best" strategies, no single member can secure a better final outcome by switching to some different strategy. (In game-theoretic terms, this amounts to showing that the Nash equilibrium points of such games are pure strategies.) In general, however, there are many such sets of best strategies; and to reduce this "somewhat embarrassing" (28) plethora of equilibrium points, the concept of "sophisticated" voting is introduced. Very roughly speaking, a "sophisticated" voter is one who uses his knowledge of the preferences, strategic opportunities, and sophistication of his opponents to predict their behavior (more precisely, to predict the strategies they will *not* employ), and who uses this information in making his own strategy choice. If all members of the committee are sophisticated in Farquharson's sense, and all aware of each other's sophistication, then this type of "hyper-rational" reasoning leads to a unique result; by successively eliminating the dominated strategies of each voter the original game is progressively reduced until each voter is left with only a single strategy—his "sophisticated" strat-

egy. In this sense, every binary voting procedure is shown to be determinate.

In a second general result, Farquharson provides a necessary and sufficient condition for a voter to have a strategy which is "best" in the much stronger sense of remaining "best" even when some or all of the other committee members play "irrationally", by using non-equilibrium strategies. As one might expect, however, such strategies—termed "straightforward" strategies by Farquharson—typically exist for only a few (or no) committee members.

In addition to these general results, a number of interesting insights are also provided by means of an example which is laid out in detail in Appendix I. In a committee whose members vote "sincerely", for example, "the later a proposal is voted on, the better its chance;" and, a voter who also possesses a casting vote (i.e. can break ties) "gets his way more often than a voter with only a deliberative vote." (p. 62) Yet, interestingly, in a committee whose members vote strategically, both of these conclusions are reversed. "Therefore, to get your way, seek extra power in a sincere committee, but shun extra power in a sophisticated committee." (p. 63)

Appendix II outlines a framework for the study of ordinal, n -person games without transferable utility. This work, while interesting, is somewhat dated, since a good deal has been done on such games since those pages were written. Appendix III presents a game as a "model" for Rousseau's *Du Contrat Social*. By analyzing the game, Farquharson secures "a rationale by which to explain Rousseau's hostility to the existence of political parties, and a means of interpreting his assertions which permits many of his apparent inconsistencies to be reconciled." (p. 80)

Such are the contributions of *Theory of Voting*. The limitations should also be pointed out: all results are for binary voting procedures, and do not apply to trinary or other procedures. Coalitions are not allowed; the analysis is non-cooperative. (In a subsequent collaborative paper, however, Farquharson managed to relax these restrictions to some extent. See M. Dummet and R. Farquharson, "Stability in Voting," *Econometrica*, 29, 1961.) One and only one of the alternatives confronting the committee must be selected; hence, unlike the situation of a legislature voting on a series of independent bills, where none, one, or all might eventually be adopted, such phenomena as logrolling or vote trading cannot really arise. To say all this, however, is to say only that a great deal of theoretical work remains to be done in voting (as in most other areas of political science).

It is still too early to say how important these contributions will prove to be. The author, however, is unequivocal as to his aims:

"the theory . . . is intended to be of use. Though its conclusions are reached by logical deductions, its assumptions are not logical truths. As an interpreted theory, it makes synthetic assertions about particular voting procedures and particular modes of behavior. Since these assertions are not analytic, they may be wrong. At least, they are testable. And if they are not confirmed, it will be certain that (logical slips aside) the explanation lies in some aspects of these assumptions. Then the way will be clear for these to be re-examined, and a more fruitful model constructed." (p. 4)

A personal guess is that Farquharson's results, properly understood and digested, will eventually prove to be quite useful, both in the study of how actual committees and committee members behave, and perhaps more importantly, as a starting point for the construction of more elaborate analytic models of political mechanisms. However that may be, *Theory of Voting* is still a little gem to read; and no serious theoretically-inclined political scientist can afford not to have mastered its contents.

Yale University

Human Nature and History: A Study of the Development of Liberal Political Thought. By ROBERT DENOON CUMMING. (Chicago: University of Chicago Press, 1969. 2 Vols., Pp. 809. \$20.00.)

This is a massive, rich, and at times curious work. Cumming introduces his reader at the outset to John Stuart Mill as *the* characteristic liberal and defines liberalism as a philosophy of "adjustment" in an age of "transition." In Mill's case the adjustment is three-fold: "scientific" in the sense of attempting to construct an ethology of human character based on a model of the physical sciences; "historicist" in the sense of recognizing the importance of time, place, and circumstance in political development; and "moralistic" in the sense of concern for man's inner self and individual diversity. Cumming professes not to write a history of ideas, but to deal with political philosophies as "structures of knowledge." This involves placing any political thinker in "topological" context with reference to "other studies"—not only the sciences and history, but economics, poetry, and rhetoric as well. His still broader frame of reference, however, consists of what he considers the two great traditions of Western political philosophy: the socio-historical tradition in which po-

litical problems are fitted into the context of history and the moral-psychological tradition in which they are dealt with in a context of human nature.

In turn, understanding Mill requires going "some distance back" to the genesis of these traditions and arguably involves the very history of ideas which Cumming has disavowed. For ultimately he traces the two traditions not simply to Polybius and Cicero, but to their differing interpretations of Plato's *Republic* and *Statesman*. In fact that part of the study could stand as a small but fascinating book in its own right. From there Cumming moves forward through Machiavelli, Hobbes, Locke, Hume and Bentham to Mill and what he regards as the desecration of political philosophy.

He presents Mill's first or scientific adjustment as having shattered the rough frame of reference of human nature within which most earlier British thinkers had managed to contain political philosophy. For Mill's resort to the method of the physical sciences fails in the end to yield any substantive ethology; the result instead is a radical split between logic and psychology which leaves us with empty method. But can Mill's historicist adjustment save us? Mill on occasion does suggest that with each succeeding generation man becomes "better adapted for study" by scientific method. This possibility that history will somehow reunite logic and psychology is quickly subverted, however, by Mill's moralistic adjustment. If Mill accepts after a fashion the Saint Simonian-Comtean view of history, he refuses to accept the levelling enslavement of man's inner self by such massive facts of history as American democracy. His antidote is of course his concern with the seemingly endless diversity of individuality and the fragmentary quality of any one individual's perspective. But that compounds the failure of his first adjustment by defying the possibility of any frame of reference within which the individual can take himself as being representative of universal human nature.

If other critics have made these same points in one way or another (without returning to Polybius and Cicero), Cumming is perhaps more original and certainly devastating in his closing treatment of Mill's *Autobiography*. There he finds liberalism in microcosm: not only Mill's acute awareness of transition around him, but his conviction that the human mind must still have "a certain order of possible progress" and that a given individual can both represent his age and get a bit ahead of it by "always pressing forward." But all this proves to be, in Cumming's judgment, nothing but a narcissistic es-

cape from Mill's failure as a philosopher. For his compulsion to demonstrate that he was always making "mental progress" leads Mill to distort in the *Autobiography* what we know from other sources about his mental history. More than that, his adjustments with his predecessors, other studies, new ideas, and history become so increasingly "slack" that Cumming uses that word or a variation repeatedly in his last several pages.

But the ultimate charge against Mill is that in failing as a philosopher he becomes little more than an historian of ideas—and of course of his own ideas. That makes him not just an heir of the dead tradition of political philosophy, but the "guiltiest of heirs—the heir who would disfigure the corpse." "There is no structure of knowledge left when the historian of ideas finds any thinker relevant insofar as his thinking was transitional—that is, insofar as it was composed simply of adjustments . . ." And that is an indictment which clearly stands in the case of a thinker whose ultimate concern is his own ideas. How about the case of Cumming himself? He covers himself somewhat by again disclaiming to be an historian and also by concluding that his very "selection of Mill to represent liberalism" was dubious. Apparently in the end Mill is not "relevant."

As for British political philosophy and liberalism, one wonders what T. H. Green or the early Laski would say about ending matters at this point. Both tried interestingly to weave new fabric from some of the loose ends left by Mill, and in a study of liberal thought it seems curious to exclude both the idealist and pluralist variations. One is also likely to be troubled throughout by Cumming's refusal to define liberalism in terms of substantive doctrine rather than as a process of adjustment per se—and especially so when Mill in the end turns out somehow not to be truly representative of liberalism. Self-government, for example, is a process, but surely liberalism's perennial commitment to that concept in one form or another has substantive significance which deserves attention. Again, if Millite liberalism fails as a "structure of knowledge," is that not a charge which can be levelled broadly at most modern political thought, without seeming to single out one ideology or culprit? And if the substantive doctrine usually identified with liberalism is not to be taken seriously, then perhaps an interpretation of liberalism in terms of social class ought to be confronted more straightforwardly. Although Cumming mentions fleetingly the possibility of Locke's "class bias," it is disappointing that he does not deal with C. B. MacPherson's telling

dissection of both Hobbes and Locke. For that dissection not only helps sort out some problems which trouble Cumming in those two thinkers; it is also relevant to Mill himself.

Nor does Cumming deal with the provocative revisionist interpretation by Maurice Cowling and W. M. Simon, who suggest that behind Mill's commitment to libertarian diversity there was always the long run expectation of some new, true, futuristic orthodoxy of moral belief and practice which would be virtually religious in quality. They document that argument in part, incidentally, with other works by Mill which Cumming very much neglects—e.g., the essays on Comte, utilitarianism, and religion.

That omission is all the more surprising when one recognizes that Cumming is sensitive all along to the basic problem in liberalism to which this interpretation of Mill responds. He spots it early in dealing with Locke when he notes the dilemma of liberalism in maintaining political tenets without postulating a total, holistic view of the world. It is not simply that liberalism has often held forth a promise of individual and group freedom which is arguably intolerable in any real society without the assumption of some frame of reference within which freedom is to be exercised. More bluntly, the problem is that the promise of freedom is almost invariably explicit, while the assumed frame of reference or orthodoxy is usually tacit, hidden, or admitted only in the footnotes of liberal theory. That of course is the gist of the charge of "hypocrisy"—whether witting or unwitting—which liberalism has faced so often of late. And in the end, perhaps that charge, rather than that he desecrated political philosophy, is the fairer one to bring against Mill himself. As for being an historian of ideas, it is difficult for me to see that Cumming deserves that description any less than Mill. But I should hasten to add that I happen to consider the history of ideas an honorable, creative calling. And Cumming's own extraordinarily thoughtful study, laced as it is with more than a little brilliance, surely confirms that judgment.

The Rise of Massive Resistance: Race and Politics in the South During the 1950's. By NUMAN V. BARTLEY. (Baton Rouge: Louisiana State University Press, 1969, Pp. 390. \$10.00.)

The author attempts to document the reaction of the white South to the push for integration during the 1950's, and to present this information within a conceptual framework which facilitates analysis and interpretation. On the first count, documenting white resistance, he succeeds

in presenting an exhaustive narrative of the rise and demise of massive resistance as the primary strategem of the white South. On the second, developing a conceptual framework, he is not as successful. His conceptual scheme flows from the somewhat convoluted 'race relations' perspective of southern politics rather than from a more realistic one incorporating the incontrovertible truth that the study of race and politics in the South is the study of an oppressed people arrayed against an oppressor bent upon maintaining that oppression. Because of this inappropriate conceptual scheme the author's analysis leaves something to be desired.

The narrative begins with an analysis of race and southern politics during the decade immediately prior to the *Brown* decision and moves through the years of unbridled massive resistance to integration and up to the period when "never" and interposition gave way to token integration. En route the author discusses the reactions of forces such as the White Citizens' Councils, third parties, community power structures, churches and labor unions to the integrationist movement. Some of the most important civil rights battles—Little Rock, New Orleans, Mansfield, Texas, and Clinton, Tennessee—are revisited. The roles of prominent southern politicians such as Faubus, Earl Long, Harry Byrd, and Leroy Collins are the subject of careful analysis. To be sure, this is familiar territory and much of it has been covered elsewhere. Still the author has made a worthwhile contribution in bringing these events together under one cover for by doing so he forces the reader to deal with their cumulative impact on southern politics. The wealth of well documented facts provides useful insights into a number of sub-areas of southern politics. For example, while much has been written about the pathological impact of segregation and discrimination on the personality of Blacks very little is known about their impact upon white personality. This in depth study of white resistance provides sharp insights into the pathological condition of white personality as regards race and politics. We see, for example, school boards firing presidents emeritus because of heretical views; state legislatures passing with gusto superfluous interposition and nullification measures; and aspirants for public office being required to respond to questionnaires to prove their unflagging racism in order to gain community support.

The narrative also provides us with a sobering historical perspective from which to view contemporary developments in southern politics. The discussion of the rise and decline of the Dixiecrat party is useful for understanding the

contemporary Wallace movement. Similarly, the discussion of the use of violence and economic pressures in tandem by white racists to maintain segregation throws in clear relief the contemporary law and order movement. Indeed we are given at least an intimation of what law and whose order are involved.

Unfortunately the full implications of the data are not developed, as indicated earlier, because of an inappropriate frame of reference. The author employs what amounts to a group approach and seeks to explain the rise and demise of massive resistance by focussing on conflict among three white groups, neobourbons, neopopulists, and business conservatives. In a brief statement which cannot give justice to the author's thesis, his argument is that the politics of race during the fifties was a struggle between neobourbons who wanted to maintain undisturbed the oppressive racist order of the South, on the one hand, and the other two groups who were somewhat more progressive, on the other. The neobourbons are defined as the politicians and political activists, primarily from the black belt, who led the massive resistance campaigns. Neopopulists are persons characterized by feelings of frontier independence with an inclination to defend liberty and democracy, bait interests, support the underdog, and favor bread and butter issues over race. Business conservatives are from the urban middle class and though segregationists show signs of being influenced "by the modern redefinition of human equality and by their urban environment."

While this triadic scheme may be useful in sorting out patterns of goal directed activity among southern whites it tends to over emphasize conflict among them on the question of white supremacy and Black subjugation. Their relationship on this score is more a consensual one than one of conflict. They differ on race only insofar as their position on it affects their pursuit of other goals. The author indicates some awareness of this when he argues in his concluding chapter that the give and take of the political process occurred "within a white supremacy context." Nevertheless, he is content to use his conflict model. This leads to contradictions in his analysis, and it mitigates against raising forthrightly questions concerning collusion among these three groups to maintain white domination. Neopopulists and business conservatives turn up playing roles assigned to neobourbons. For example one neopopulist Governor is quoted lecturing on the best strategy to maintain "maximum segregation," while another is quoted threatening to register "every damn nigger in Macon county" to punish an adversary.

Governor Coleman, Mississippi's business conservative, is recorded as defending the confinement of a Black professor who applied to Ole Miss to the insane asylum because "if he were not a lunatic" he would realize that there would be no integration in Mississippi.

The author's contribution would have been greater had he given more consideration to his assertion that the give and take of the political process occurred in a white supremacy context. Had he done so he would have perforce begun with the question "What strategies were used by various white groups to maintain white oppression?"

Atlanta University

Personality and Politics: Problems of Evidence, Inference, and Conceptualization. BY FRED I. GREENSTEIN. (Chicago: Markham Publishing Company, 1969. Pp. 200. \$5.95.)

As the sub-title to his new book indicates, Fred Greenstein wishes to sort out the methodological and theoretical problems associated with research into psychology and politics. His enterprise is worthy. After all, the personality and politics literature has been the discipline's stepchild for a very long time. Greenstein rightly notes that this literature's shapelessness, its dubious methodological assumptions, and its paucity of supported conclusions have combined to discourage political scientists from drawing upon it for enlightenment. He also believes, correctly I think, that without some understanding of the impact of personality on politics, theory building in political science will suffer. Therefore, he attempts to rescue the study of personality and politics from unmerited oblivion by providing it the form and theoretical foundation it presently lacks.

We could desire no more accomplished, knowledgeable, or judicious Vergil than Greenstein to conduct us through this mottled landscape. He has been charting the geography of the area for many years; indeed, much in this present book has appeared elsewhere, though in altered form.

The author pursues a three-fold strategy. He reviews the pertinent literature, ordering it into clear and manageable categories. He confronts the criticisms of those who have derogated the personality and politics enterprise; in the process he offers his own theoretical rationale for research. Finally, he proposes guidelines for useful future inquiry in the area. Greenstein specifically disavows (p. 152) any desire to prescribe research practices, but the pains he takes to reconstruct the logic of personality and politics inquiry, when added to the specific suggestions

he proffers, belies his disavowal. Is Greenstein's effort successful? I believe the first aspect of his strategy clearly succeeds, but I see only limited success for the other two.

Greenstein proposes to group the personality and politics literature into two sets of categories. The first set is defined by the size of the population to which personality attributes are imputed. Thus, studies are made of individuals, personality types, and large aggregates, including whole societies. Greenstein argues persuasively that there are distinct theoretical and methodological problems associated with study in each of these domains. He next divides the literature by the tasks it undertakes. The tasks are also of three sorts: descriptive or "phenomenological," "dynamic," and "genetic." Again Greenstein has hit upon useful categories. Describing accurately the situation in which personality is presumed to have an impact upon politics is manifestly different from describing the way the personality structure in question actually operates. Therefore, the dynamics of personality functioning should be distinguished from the phenomenology of personality impact. Similarly, uncovering the origins of personality is quite different from describing personality dynamics themselves. Greenstein's analysis of the authoritarian personality in terms of these three analytic tasks provides one of the highlights of the book. His clear exposition will undoubtedly reduce the number of future students who will confuse dynamism with genesis, a mistake rife in both current scholarly literature and popular parlance.

Once having arranged the literature into these categories, Greenstein pursues the second phase of his strategy: establishing the viability of personality and politics research. In this effort, he is less successful. Part of the problem lies in his occasional inability to address the difficulties associated with assessing the impact of personality on politics. For example, he believes that once one demonstrates the possibility of individual impact on political events and also proves variability in individual response to situational constraints, he has made a case for the impact of the individual personality on the political process. But his argument does not take account of a logically prior problem. The only way one can demonstrate the impact of a particular leader, say, on a political event is by proving that another leader would have had a different impact. This proof is impossible to offer, for history provides us no opportunity for the necessary experimental manipulation of events. This dilemma (usually designated the contrary-to-fact conditional) is unresolved by Greenstein's analysis.

One of Greenstein's methods for establishing the viability of personality analysis in political science is to turn the objections leveled against such analysis into a series of empirical propositions, which, if investigated, could yield a range of situations within which personality has political impact. This method, while ingenious and defensible, is marred by the triviality of the hypotheses Greenstein offers to guide the necessary research. Thus, to the objection that individual actors rarely influence political events, Greenstein replies that impact will be greater "... to the degree that the environment permits of restructuring." (p. 42, italics his). Who would have thought otherwise?

Moreover, Greenstein's method focuses mainly on malleable characteristics of the political environment. Consequently, his hypotheses are addressed primarily to political scientists whose major interest lies not in personality at all, but in the more traditional stuff of politics. Greenstein's propositions thus hold the study of personality in abeyance, by implication accepting the contention he means to question: that personality studies are a residual category in political analysis.

Greenstein makes a second attempt to establish the validity of personality research in the study of politics. He aims to remove from the field its reliance upon Freudian assumptions about personality structure and dynamics. Greenstein points out that these assumptions have frightened off many potential investigators. But again he encounters some knotty theoretical problems. For example, he argues that one of the difficulties with the literature on the authoritarian personality is its foundation in Freudian ego-defense. In some cases, he argues, authoritarianism is a rational, cognitive response to a restrictive environment. This is an important point to make; yet it does not necessarily do what Greenstein wishes it to do. It does not establish the utility of personality research in the cognitive or ego psychology mold. Unless it can be shown that a non-Freudian theory produces personality structures which are resistant to the environment we have not established the utility of non-Freudian assumptions. Greenstein apparently assumes general knowledge of such proof, for he ignores the problem. Yet, at least at first glance, a non-Freudian psychology leaves the individual comparatively vulnerable to environmental stimuli. If so, why study personality? This crucial omission will leave some readers with the unfortunate option of either continuing to rely upon Freudian theory or of forgetting about personality in politics. Moreover, as Greenstein himself hints (p. 146), demonstra-

tion of the utility of non-Freudian assumptions may be difficult, because even distinguishing ego-defensive from other behavior is problematic.

Not surprisingly, therefore, the guidelines Greenstein offers the future researcher must remain in some animated suspension. However, most of the suggestions he offers should prove useful whatever the resolution of these theoretical dilemmas. This section on Greenstein's work profits by its close attention to the few true successes in the personality and politics literature. But again Greenstein occasionally fails to examine the theoretical implications of positions he takes. For example, each of his strategies for personality research involving large aggregates, while perhaps useful in themselves, assumes some position on the tie between individual personalities and the functioning of such aggregates. These positions are not addressed or explicated in the text, thus leaving the utility of the guidelines uncertain.

These criticisms should not detract from the many strengths of the book. Any analyst of this subject would encounter the problems which plague Greenstein. Few would clarify them so well or confront them so candidly. This book will be welcomed for its capacity to introduce advanced students to the problems and literature of this field. Certainly Greenstein's bibliographic facility rewards us all. It is perhaps fruitless to ask for more, given the state of our knowledge. I suspect, however, that advances in the analysis of personality and politics will come less from trying to follow any particular program, and more from the creative efforts of future investigators unwilling to abide by the strictures of friends or foes.

RICHARD M. MERELMAN,

University of Wisconsin

The Politics of Weapons Innovation: The Thor-Jupiter Controversy. By MICHAEL H. ARMACOST. (New York: Columbia University Press, 1969, Pp. 304, \$10.00.)

This is an admirable case study of the controversy over research, development, production and deployment of intermediate range ballistic missiles (IRBMs) during the 1950's era of the "New Look" in military policy. The Thor-Jupiter controversy's importance in the history of postwar American defense policy would be assured by its substantive aspects alone; it was a central focus in conflicts over how best to exploit technological and strategic opportunities for long-range, nuclear-armed weaponry in meeting a dangerous and growing Soviet challenge to American superiority. Conflicting propriety and budgetary claims of the Army and

Air Force gave the controversy added importance. The decision to allow both services to develop IRBMs, the further decision to produce and deploy both the Army (Jupiter) and Air Force (Thor) systems, and the putative obsolescence of both systems before they even became operative, all served to reinforce common suspicions that the controversy was a major example of wasteful inter-service rivalries. So the Thor-Jupiter controversy became a major stimulus to the Defense Department reorganization in 1958, and to the more extensive revolution in weapons selection and other defense policy processes in the McNamara era. Finally, having failed to anticipate the consequences of the IRBMs dependence on overseas bases, American planners were unnecessarily surprised to discover that our NATO allies' security interests are not always compatible with our own. The ensuing conflicts over Thor and Jupiter deployments helped to uncover a malaise in NATO strategy which still plagues the alliance.

Professor Armacost recounts these and other aspects of this controversy, and also offers to explain them. He builds his analysis around a pressure-group model of policy-making, treating the military services as institutional interest groups. Exploring the implications of this model about as far as possible in a one-case study, he raises and partly answers important questions about how closed is the relatively closed process of converting innovations in weapons technology into hardware to serve policy ends. He offers illustrations and a partial synthesis of findings by Hammond, Hilsman, Huntington, Schilling, Snyder and other contributors to the series sponsored by the Institute of War and Peace Studies at Columbia University; this study, like the others, emphasizes the highly political character of national security policy-making. The pressure group model is, he concludes, a better explanation of how military-technological innovations are incorporated into policy than is C. P. Snow's picture of a secretive and uncommunicative dialogue between politicians and experts.

Beyond explanation, Armacost also attempts some judgments on the process. How reasonable, he asks, are decisions likely to be in a decision system that weights lateral bargaining among component elements at least as heavily as the central coordinative pressure of the ostensible decision-makers? Much of the justification for the decisions in this case, he argues, must be found in the pressures that activated the decision process, rather than in the character of that process itself. Thus the decision to pursue two lines of research and development instead of one, to create production facilities concurrently

with development, and to deploy the missile systems despite their obsolescence, all derived largely from pressures to produce an interim long-range capability as quickly as possible. To a point, rivalry between the Army and the Air Force was a positive factor, opening up the decision process to consideration of alternative solutions; and both inter-service and inter-industry rivalries helped spur new and potentially valuable innovations in missile technology.

But his judgments on decision outcomes are not all positive. The yield in technological innovations was a "haphazard" by-product of rivalry between development programs in the two services, for there was no clear understanding at the center of how this yield might be maximized. Limited production of both missile systems was not decided on the basis of any careful cost analysis; apparently it was just easier to authorize this than to write off one or the other development program, with its parallel production capacity, against the cost of producing a single capability. Perhaps most difficult to justify is the decision to produce an IRBM capability at all. It will not do to justify production of an obsolescent weapon system on the *post hoc* grounds that parts of the product proved valuable in the space program; that was a fortuity, not a planned result. The justification must lie in the interim character of the IRBM capability; but all that was really considered in this regard were the pressure of time and the possibility of achieving an intermediate range capability well ahead of the production of inter-continental missiles. "There is little evidence to suggest that comparable attention was paid to equally important design criteria such as the political suitability of highly vulnerable, slow-reacting, intermediate-range missiles in Europe" (p. 263).

For these and other shortcomings in the decisions, Armacost faults weakness at the center—in the Secretary's office, in the budgetary processes, and in the conciliar and Presidential realms of national security policy-making. Strengthening coordination at the center would be no panacea; but neither, he concludes, does mutual adjustment among partisan rivals yield perfectly coordinated programs. Armacost also records some important changes in the weapons selection process during the 1960's, changes increasing coordinative power at the center of the defense community and enhancing the rigor and quality of analytical inputs. He raises important questions about these changes, but of course cannot answer them within the bounds of a single-case study and a single-model view of the policy process. Needed now are comparative studies, over time and among cases, and a more

rigorous attempt to define and classify the stakes perceived by participants in the decision process as they analyze, persuade, and bargain their way to policy decisions. The most important contribution of this study to that larger effort is its demonstration of the quantity and quality of data available in the public record, a consequence of the openness in the decision process that the study reaffirms.

Rice University

The Behavioral and Social Sciences: Outlook and Needs. A Report by the BEHAVIORAL AND SOCIAL SCIENCES SURVEY COMMITTEE, under auspices of the NATIONAL ACADEMY OF SCIENCES' COMMITTEE ON SCIENCE AND PUBLIC POLICY and the SOCIAL SCIENCE RESEARCH COUNCIL'S COMMITTEE ON PROBLEMS AND POLICY. (Englewood Cliffs: Prentice-Hall, Inc., 1969. Pp., 320. \$7.95.)

For several reasons, this report is likely to be regarded as a landmark document. It presents the first systematic, empirically-based, collective self-portrait of ten recognized social science disciplines, framed in a policy context of how professional social scientists, as distinguished from promoters and amateur sympathizers, appraise the resource-potential of the behavioral-social sciences for dealing with the problems of society. The picture of their growth and present state of development is painted as far as possible in quantitative terms: (1) membership, degree production, university research organization (governmental, industrial, and nonprofit-corporate research are passed over lightly), facilities and costs; (2) an estimate of the requirements in dollars for maintaining this existing national asset over the next ten years, exclusive of new, large-scale programs; (3) a series of policy recommendations, directed mainly but not exclusively to the federal government, designed to foster such progress.

The overall study-report constitutes a symbolic act of integrated planning for the behavioral and social sciences. The full implications of the decision by an official committee of the National Academy of Sciences to sponsor its publication jointly with the executive committee of the Social Science Research Council may take years to realize. One obvious implication is that the social sciences have finally joined the natural sciences in pursuing methods the latter have used successfully since the 1944 Bush report to persuade Congress and the public to visualize science as a vital national resource, whose maintenance and expansion is a public purpose to be achieved through investment in annual

budgets and appropriations. Another is that the natural sciences have finally recognized that the methods and attitudes of *science* (sic) have been extended to the sciences of man. Still another is awareness and acceptance by all the sciences, natural, biological and human, of the need to apply the full range of scientific knowledge and analysis to the problems besetting contemporary and emergent societies.

Lastly the NAS-SSRC report is important because it is the product of a voluntary, pluralist-federalistic exercise in representative self-government by qualified representatives of the behavioral-social sciences themselves. The manner in which the NAS-SSRC project was set up and carried through is instructive. A Survey Committee, consisting of six to ten-member panels for each of the ten designated disciplines (more than 80 social scientists) was appointed jointly by the Academy's Science and Public Policy Committee and the Council's Problems and Policy Committee. It does not appear precisely how the nominations and final appointments were arrived at, but one may infer the pattern of extensive informal consultation, clearance and cooptation, that characterizes so much of the relationships between confederate peak-scientific organizations and autonomous, constituent scientific societies, was followed. From each of the six major social science panels (anthropology, economics, history as social science, political science, psychology and sociology) a panel chairman and co-chairman was appointed by the SSRC Problems and Policy Committee; from the other four panels (geography, linguistics, psychiatry and statistics) a single chairman was chosen. These sixteen plus two other co-opted members, and a Central Staff composed of a Chairman and Co-Chairman of the Survey Committee, both named by the SSRC, and an Executive Officer from the NAS staff, made up the 21-member Central Planning Committee which designed the study, reviewed and approved the final report drafted by the Central Staff. Begun under the administration of Pendleton Herring at SSRC, the final document clearly bears the imprint of his successor, Henry Riecken, who was co-chairman of the Planning Committee, Ernest Hilgard, the chairman, and Stephen Viederman, the Executive Officer. Harvey Brooks, chairman of the Academy's Science and Public Policy Committee, also seems to have been a key figure in the entire project.

An outstanding feature of the study was a questionnaire survey of behavioral and social science research units (departments, centers, institutes, libraries, laboratories, professional schools, computer centers and central financial

coordinators) at 135 universities, whose responses provided much of the data used not only in the overall report under review, but in the *ten separate reports on each of the disciplines* prepared contemporaneously by the panels composing the Survey Committee. The political science study, drafted by panel chairman Heinz Eulau, has already been published by Prentice-Hall, and deserves major attention by the discipline, along with the two Somit-Tanenhaus studies for comparison.

Space limitations prevent evaluation of the authoritative findings and related recommendations of the NAS-SSRC report. No less than seven chapters (1-5, 16-17) are devoted to a remarkably readable, descriptive explanation of the social sciences for the citizen, public official or legislator seeking a realistic understanding of what they do, how they do it, and what they can be expected to contribute toward the formulation of public policy. The Planning Committee's six major recommendations and supporting documentation may be summarized as follows:

- 1-2 (Chapter 6). The Committee associates itself with efforts under way to develop a *system of social indicators* revelatory of basic trends in the structure and processes of society, and endorses the principle of Congressional legislation to encourage this objective. Pending and preparatory to official, public assumption of this responsibility, behavioral and social scientists outside the government are urged to start work on the problems connected with the publication of an *Annual Social Report to the Nation*, identifying and measuring fundamental changes in the quality of life for all people.
- 3-4 (Chapters 7-8). To support the analytical and interpretive tools envisaged in the first two recommendations, the Committee proposes the establishment of a *special technical commission* to investigate and recommend procedures for a *national system of statistical data reporting designed for social scientific purposes*, and a *continuing high-level governmental body* including nongovernmental members to investigate and prescribe policies for *protecting the anonymity of respondent-contributors to the national data pool*.
- 5 (Chapters 9-13). The Committee presents a critical analysis of existing research organization, primarily within universities, and emerges with a recommendation that *universities should consider the creation of new, broadly-based, programs of interdisciplinary training and research, outside the established disciplines, symbolized by the organizational concept of a Graduate School of Applied Social Research*. This organizational unit should

combine commitment through research both to basic understanding of human relations and to solution of persistent social problems.

- 6 (Chapters 14-15). The Committee concludes from its analysis of research funding from all sources that *an annual increase of from 12-18 per cent in federal support of basic and applied research is necessary to sustain normal growth of the behavioral and social science through the 1970's*.

To a reviewer located on the outer periphery of the academic, foundation and governmental circles whose thinking is reflected in this document, the recommendations scarcely seem controversial. Perhaps this is because they are deeplying and fundamental, far below the popular-ideological level of present-day political controversy. This very quality may lead observers less oriented toward the academic-scientific-administrative elite to question their "policy relevance." Persons accustomed to thinking about poverty, urban decay, crime and environmental pollution on the intellectual level of TV-reporting are not likely to get "involved" in improving our census, welfare, police, housing, health and education statistics. The role of scientific information in shaping the objects of public controversy, as for example in how inflation should be controlled, or how to channel low-income and educated people into constructive participation in local community-improvement programs, is scarcely touched on in this report. The reasonable rejoinder by the Committee that "this was not our problem" highlights the fact that the report was prepared primarily by university social scientists and research administrators interested in fostering the progress of basic social science, on the premise that such progress is a prerequisite for improving our understanding of how to tackle basic social issues. The "new politics" of the 1960's challenges exactly this presupposition, without necessarily refuting it. In support of the committee, however, is the feeling that public funds would be better spent on social research than weapons development, and, far from being radical, the Committee's proposal of an annual increase in federal social science funding of 12-18 per cent for the 1970's is conservative compared with the 20 per cent average that was in fact experienced from 1959-1968.

Within the university community, the most interesting and controversial proposal is for a new Graduate School of Applied Social Research. It is not clear whether the Committee had in mind the model of a School of Social Engineering, to train experts in "social bridge-building," specialists in labor and race relations,

in industrial, political, financial and community organization, urban planning, the administration and control of violence in local, national and international affairs, etc. Its thinking is focussed on what it calls "applied" research into such problems. But the conceptual connection between applied social research and social engineering-development, and the institutional relations between the basic social science disciplines and a School of Research in Public Policy Applications, surely deserve resuscitation and widespread re-examination in the academic community, already watching experiments under way at Yale, Buffalo, Irvine, and Pennsylvania State University, not to mention Syracuse, Cambridge, Princeton and Berkeley.

Vanderbilt University

Political Science: The Behavioral and Social Sciences Survey. EDITED BY HEINZ EULAU AND JAMES G. MARCH. (Englewood Cliffs: Prentice-Hall, Inc., 1969. Pp. 148. \$5.95.)

The Making of a Political Scientist: An Empirical Analysis of Ph.D. Programs. BY NORMAN LUTTBEG AND MELVIN KAHN. (Carbondale: Public Affairs Research Bureau, Southern Illinois University, 1969, Pp. 72.)

Both of these books are largely based upon questionnaire-response data; both occasionally touch on the same topics, since the Eulau-March volume considers certain aspects of graduate training and the Luttbeg-Kahn study, its title notwithstanding, is concerned with more than just Ph.D. programs. There, however, the similarities cease. *The Making of a Political Scientist . . .*, the work of two young political scientists, is really little more than a pamphlet published by a University "bureau." *Political Science*, edited by two of the profession's senior members (speaking for a panel of eminent colleagues), is one of a series of studies covering the social sciences being done under the prestigious auspices of the National Academy of Science and the Social Science Research Council. More importantly, the two volumes are addressed to different audiences and are intended to serve quite different purposes. For this reason, I will consider them separately, rather than in relationship to each other.

In early 1966, Professors Luttbeg and Kahn sent a questionnaire to the chairmen of some seventy political science departments then offering the doctorate degree. Beyond their desire to secure information about Ph.D. programs, graduate student recruitment policies, placement practices, etc., the authors sought to answer two

questions: First, how do these departments fall on a "behavioral-traditional" scale? Second, as the chapter heading puts it, "Departmental Status: Does It Make a Qualitative Difference?" The answers to these questions will be of interest, I suspect, largely to fellow political scientists.

The authors found (on the basis of fifty-six replies) that 46% of the departments are (or were) "behavioral" in orientation, 37% are "traditional," 11% can be classified as "eclectic," and only 14% are strongly committed one way or another. Some of those who have followed the interminable discussions of this issue may share my skepticism that these terms have any useful, let alone consistent, meaning. These classifications, moreover, were based entirely on the chairmen's evaluation—and I am reluctant to accept any one man's opinion as a reliable guide in this matter.

Are there measurable differences in the quality of graduate training offered, respectively, at "status" and "non-status" institutions (Carter's ratings are the basis for this distinction)? The hypothesis on which the authors proceeded was that there would not be significant differences with regard to "empirical orientation, admission and retention policies, curriculum content, language and research tools, testing procedures, and placement efforts" (p. 25). This hypothesis was confirmed. The authors report a "... remarkable absence of any relationship between status and *graduate training characteristics noted in this study*" (p. 41, italics mine). These findings are undoubtedly correct—if these are the proper "characteristics" by which to measure the "quality" of graduate training. Messrs. Luttbeg and Kahn, I should add, admit that other criteria could be equally—or more—relevant.

To summarize: I am not altogether sure that the first of their two questions was really meaningful and, in any event, am unhappy about the evidence on which their conclusions were based. The second question was defined in such a fashion that, in my opinion, it skirts rather than directly confronts the matter of quality. Still, if they have not been able to accomplish their major objectives—and as competent professionals they are fully aware of these difficulties—Professors Luttbeg and Kahn have brought together some very useful information. Given recent changes in graduate programs, their findings may no longer tell us where we are now, but they do provide valuable base-line data for subsequent studies.

The Eulau-March volume, we are immediately informed, was "... written not for our col-

agues who practice political science as a profession, but for those on whose good will and understanding the future of the discipline greatly depends—governmental and educational policy makers, members of the Congress and the state legislatures, foundation officials, university administrators, and other interested citizens" (p. 1). The purpose of the book is to persuade this audience that the "discipline's research and research training needs" should be supported in more generous fashion than has been the case to date.

The volume, then, is essentially a proposal, and its organization and contents are necessarily shaped by its basic objective. In a truly admirable opening section, the authors drive home the point that "the further development of a science of politics will have important consequences for the training of tomorrow's leaders, for understanding society's needs and wants, for the development of sound policy analysis and public policy itself" (p. 2). This theme is repeated in Chapter 1, entitled "What Political Science is About" and, perhaps to resolve any remaining doubts, Chapter 2 deals with "Relevance for Public Policy." The remaining five chapters describe, respectively, "Changing Frontiers of Theory and Research," "Personnel: Status and Trends," "Financing Research and Research Training," "Education for Research in Political Science," and "The Prospects of Research in Political Science." These last-named chapters follow a common format: First, the current situation is described, with substantial reliance on data derived from a 1968 questionnaire survey. This done, the authors advance recommendations aimed at improving and strengthening the discipline. In almost every instance, the recommendation specifies the amount of money needed for its implementation.

There is a wealth of information about the profession here. Some of it amplifies and updates earlier studies (i.e., field distribution); some of it is quite original (i.e., per faculty dollar support of research, by status of department). The spatial limits of this review compel a selective treatment and I will accordingly comment only on the projections of Ph.D. output (p. 70). I think these are mistaken in two respects. First, they do not include either international relations or public administration doctorates. Second, they are much too conservative. Thus, they estimated that political science output alone (sans the aforementioned two sub-fields) for 1967-68 would be 391 doctorates. The reality was 452—and the total for all three areas a whopping 561. These technical matters aside, I regret that the

panelists did not consider the longterm consequences to the discipline of a doctoral output now running close to 700 annually and one likely to hit the 1,000 mark by 1975-76.

Eulau and March advance some fifteen separate proposals (unfortunately, the volume does not provide a summary of these). Since many of them cannot be briefly restated, selectivity is again in order. I find it difficult to muster much enthusiasm for the suggestion that we establish a "national training program in psychiatry for young political scientists" (p. 51). This may have been a fresh and exciting idea at the Science of Politics meeting forty-five years ago but there are many other fields (economics, mathematics, ecology, biology, even sociology) where training programs would be far more useful for *tomorrow's* political scientists.

Having established my critical independence, let me promptly say that there are a number of imaginative and potentially fruitful suggestions: for "national study centers," (p. 131), for expanded NSF funding for political science research (p. 140), for increasing the number of "strong" departments (p. 74), for new training programs at the post-baccalaureate and doctoral levels (pp. 119-121) and, though I have my reservations, for "explicitly preprofessional undergraduate programs for behavioral and social science" (p. 114).

Are Messrs. Eulau and March correct in claiming that they have advanced some "bold proposals"? I think so. Not only are several of their suggestions imaginative but it would cost almost seventeen million dollars *annually* to fund their recommendations—and for political science this is very bold thinking indeed. They have been equally bold, many will agree, in their view of the contribution which political science can make to policy formation, now or in the immediate future.

On balance, the members of the panel have done all that could be asked of them. They have provided us with a great deal of information about the profession—more, I suspect, than most political scientists want to know. But this is of secondary importance. The panelists were charged with the task of developing proposals which would lead to expanded public support for political science and they have responded with some (hopefully) attractive ideas. Whatever comes out of their efforts operationally (in terms of actual funding), the profession owes them a vote of thanks.

BOOK NOTES

POLITICAL THEORY, HISTORY OF POLITICAL THOUGHT AND METHODOLOGY

Ideologies and Utopias: The Impact of the New Deal on American Thought. BY ARTHUR A. EKKIRCH, JR. (Chicago: Quadrangle Books, 1969. Pp. 307. \$8.50.)

This is Professor Ekirch's eighth book. It is interestingly written and neatly organized—a pleasantly readable study. The book does not pretend to be a general intellectual history of the thirties for, as the author makes clear, the focus is on that complex whirl of ideas, alternating in hope and frustration, that were at the intellectual center of the New Deal. The author's skill in framing various and changing images of FDR from the recommendations and responses of intellectuals to the New Deal deserves note. The book draws upon fresh materials in the National Archives, the Roosevelt Papers at Hyde Park, and important private collections. The reader will find stimulating commentary and well-chosen quotations from and on the social and political thought of leading New Dealers and anti-New Dealers such as Wallace and Tugwell, Arnold and Thomas, MacLeish and Edmund Wilson.

However, the main interpretative themes of this historian's analysis of the role of the New Deal in American life and thought are not new. This reviewer finds most of these themes or perspectives on the New Deal present in the Professor Ekirch's previous works. *Ideologies and Utopias* elaborates these perspectives, develops them in some depth, and gives them a forceful synthetic statement. Ekirch's general thesis is that the "nationalism or statism of the New Deal," the "wave of the future" carrying us "further away from the individualistic heritage" of our past, "inaugurated the real revolution in modern American life and thought." (p. viii, 262, 265) The author is clearly inclined to view the New Deal as a "revolutionary era in American thinking." The bold outlines of this image of the New Deal and its impact begin to fade, however, when we perceive them from the interpretative milieu of Ekirch's 1955 book *The Decline of American Liberalism*. In other words, when we pick up the historian's telescope in the 1955 study it is as if we can see the "wave of the future" building up from afar, whereas in the current study the same instrument seems at times to have caught a sea monster looming into view. The conceptual pattern used in *Ideologies and Utopias* is continuous with that developed in the earlier work. The concept of liberalism is at the heart of the matter.

The reader is advised to consider the 1955 study (available in paperback since last year), for the New Deal is here one of the latest chapters in a long story: the decline of American liberalism. If we accept Ekirch's 1955 construction of the concept "liberalism" (which he admitted was "rather precise and rigid") and his corollary idea of "the progressive tradition" running from the Square Deal to the Fair Deal, then the role of what his new book calls the "nationalism of the New Deal" in constituting a "new departure in American thought," even a "new public philosophy" may appear enormous indeed. In relation to the particular terms of Ekirch's norm, "historic" or "classical" liberalism, the stress in *Ideologies and Utopias* on the New Deal's "nationalistic concepts of planning and collective social action" as "[s]ingularly modern" (p. 264) appears logical. The reader may wonder if it is the soundest historical logic.

However, the prospective reader of the book deserves from the reviewer a more substantial account of Professor Ekirch's chosen perspective on the New Deal. Perhaps some readers will be inclined to challenge the Ekirch definition of liberalism as leading to a concept of "conservatism" unfit for coping with the complex realities of a "modern pluralistic democracy." In the foreword to his 1955 book, Ekirch suggested that probably "it would be fairer if modern liberals would agree to being called progressives, socialists, nationalists, etc. . . ." The reviewer suggests that there is substantial merit in viewing Ekirch's "modern liberals" as nationalists and as part of the progressive legacy. But the reviewer proposes that most of these same liberals would legitimately claim that they are "pluralists" and not "socialists" and that, correlatively, the New Deal which is so central to their self-image as well as to their image of American society was not "nationalistic" in some of the ways Ekirch contends in *Ideologies and Utopias*. (The reviewer commends his development of this thesis in chapter 7 concerning the dispute among the intellectuals on the role of education in a general period of war).

Specifically, Professor Ekirch's interpretation of the New Deal's "statism," while it points up some very serious problems (as in the field of education), may have some notable shortcomings. The reader is advised to consider Ekirch's notion of the singular *modernity* of the New Deal's "nationalistic concepts of planning and collective social action" (present also in the 1955 book) in light of

Andrew Shonfield's *Modern Capitalism* (1965), Chapter XIII, and the last chapter of Grant McConnell's *Private Power and American Democracy* (1966). McConnell's study shows how a strong American tradition of decentralization has fostered the development of an array of elite-based power structures which by various means have acquired a significant degree of control over major areas of public policy. McConnell writes of the "tradition of the virtuous small constituency" and, like Lowi more recently, he criticizes the illusion "that the surrender of public authority to private hands results in democracy." (p. 367-368) Shonfield's comparative analysis shows both the New Deal's alleged commitment to natural planning and the role of public power considerably more uncertain than does Ekirch. Shonfield says of Roosevelt that he responded "to a national instinct to break up government into many small parts, an instinct which seems at times to be guided by some eccentric model of a system of administration in which a lot of independent bodies engage in furious competition with one another—the nearest thing in fact to a market place." (p. 318)

The point is certainly *not* that *Ideologies and Utopias* tends to be a right-wing diatribe against a "socialistic New Deal." Rather the book's author deliberately steers the reader away from the conclusion and emphasizes that the new political economy that emerged was "an amalgam of private enterprise and government controls, an American version of state capitalism and social democracy." (p. 104). It is almost as if he were suggesting to a large portion of his audience: "I won't interpret this 'socialist' if you won't call the interpretation 'reactionary'." According to Louis Hartz, it is the game that good, tolerant American Lockean play. At times Ekirch offers support to the pluralist view of the political impact of the New Deal, but it almost seems that for every concession to what Lowi calls the new public philosophy of interest-group liberalism a cost is marked, e.g. by a reference to the "paternalism of the modern bureaucratic state." (p. 263) Roosevelt preserved capitalism but capitalism has become an "adjunct of a welfare-warfare state" (p. 104, 262) Ekirch quotes Vernon Louis Parrington in 1929: "We must have a political state powerful enough to deal with corporate wealth, but how are we going to keep that state with its augmenting power from being captured by the force we want it to control?" Ekirch goes on to write that what Parrington and others did not anticipate was that "the depression would go far to destroy the political influence of big business and to restore to the people the political power they appeared to have lost in the twenties." (19-20)

The reviewer's point is not that the New Deal, in terms of actual achievements, made a smaller

impact on American society than the progressive movement. Quite the contrary! Neither is the point to castigate Ekirch's deference to pluralism with a Millsian "power elite" argument. Rather, as the use of the Shonfield and McConnell studies would have made clear, the problem in Ekirch's interpretation is his inclination to confuse the American bureaucratic politics of small constituencies with "national planning." For example, he holds (unlike Shonfield) that "there was a continuing element of national economic planning which gave to the later New Deal, as Richard Hofstadter has pointed out, 'a social-democratic tinge never before present in American reform movements'." (p. 107) Actually, both Hofstadter in the *Age of Reform* (1955) (pp. 305-306) and Michael Rogin in his critique of pluralism, *The Intellectuals and McCarthy* (1967) (p. 204) indicate that this "social democratic tinge" was related to the mass working-class base on which the New Deal depended and to which it reacted. Hofstadter's "new departure" thesis on the New Deal did not stress planning, but Ekirch obscures this somewhat and perhaps because concepts of "planning" and "nationalism" are central to his own thesis of a "new departure in American thought" which he argues was manifested in the New Deal itself (105-108).

The support for the pluralist view of the New Deal's impact combined with the thesis on the New Deal as a "revolutionary era" in Ekirch's book need not be seen as contradictory if we consider Rogin's analysis (following Hartz) of the dialectical interplay of pragmatism and moralism in Lockean liberalism. (194-195) Perhaps Hartz's concept of the liberal, fragment society is more useful than Ekirch's concept of liberalism developed and employed in terms of the tradition itself. To quote Hartz in *The Founding of New Societies* (1964) (p. 117): "What is centrally involved is the entire obscurantist attitude of the New Deal tradition itself which, in its pragmatism, has not dared to disturb the national absolute." The doctrinal connections between the New Deal and the progressive movement are well-known. "Progressivism introduced administrative liberalism into American politics" (Rogin, p. 205) and the New Deal institutionalized it, the process feeding on war-related tensions as Ekirch brings out well. Contemporary pluralist theorists of the new industrial state, are in many ways, part of that progressive tradition which has done so much to bureaucratize the reform impulse. In Ekirch's friendly study they have the pragmatic achievements of the modern technological ego balanced by the moral claims of the traditional liberal super-ego: a new departure perhaps but the pattern of ideological ambiguity seems familiar.—HERBERT REID, *The University of Kentucky*.

The State in Capitalist Society: An Analysis of the Western System of Power. BY RALPH MILIBAND. (New York: Basic Books, Inc., 1969. Pp. 292. \$6.95.)

Ralph Miliband is a Marxist—no slavish toady of cant—but, as befits Harold Laski's intellectual successor at the London School of Economics, an unfettered practitioner of socio-economic analysis who can be as disconcertingly unsentimental about the socialist pretensions of the British Labor Party (see his *Parliamentary Socialism*, 1961) as he is caustic about the democratic pretensions of pluralist ideology. Neither the labor movement, the pluralists, nor the Western system of power come off very well in this important new study, characterized by Miliband as "a general sociology of advanced capitalism." In place of the 'postcapitalist' pluralist model (dismissed as "... a profound obfuscation of reality"), Professor Miliband offers an updated marxism which although intended to overcome traditional deficiencies accepts that

The economic and political life of capitalist societies is *primarily* determined by the relationship between . . . the class which . . . owns and controls and the working class . . . The political process in these societies is mainly about the confrontation of these forces. (p. 16)

Free from the sterilizing ambitions of 'value-free inquiry', Miliband pursues this relentless sociology beyond the irrelevancies of empirical functionalism (which in its Simonian treatment of values as instrumentalities must swallow uncritically the non-instrumental ends dictated by the status quo) to a radical posture in which the empirically dysfunctional can be treated as the socially necessary.

Professor Miliband proceeds concretely, undertaking a comprehensive survey of power relationships in France, Italy, Japan and other selected 'advanced capitalist' nations as well as in England and America. Within systems Miliband distinguishes the state from its several organs—permitting comparative analysis of such putatively 'neutral' institutions as the judiciary, the civil service and the military, and allowing scrutiny of the legitimizing roles played by schools, churches and mass media; purportedly classless ideals like nationalism and the public interest are convincingly depicted as guises for class interest and elite rulership.

Miliband does not, however, conjure up a monopolistic ruling elite in direct control of the state, but portrays rather a dominant economic class into whose hands is concentrated a radically disproportionate share of wealth, giving it an irresistible advantage in the theoretically egalitarian competition which legitimizes democracy in the pluralist pressure system. It is this capacity for indirect rule that allows capitalism to flourish in the

absence of overt repression.

Compelling as this vision is, the perspective from which it issues is not without conceptual and methodological difficulties. Conceptually, Miliband must rely on the inflexible economic categories of historical materialism. But when uprooted from the European environment and applied to the peculiar exploitative variations of American capitalism, notions like 'class struggle' or 'class consciousness' lose much of their explanatory power—seem almost quaint and antiquarian, as if the standards of "Aida" were being employed to judge the aesthetics of "Hair."

European unions may still fall victim to government-business conspiracies, and a 'socialist' government in England is foisting wage restraints on a reluctant T.U.C., but in America unions are more often found black-mailing timorous city governments or intimidating defensive oligopolies. European poverty has been class-conscious, but American poverty is race-conscious. The spectre which haunts America is not worker's revolution but racism, urban blight and ecological mayhem. Indeed, when Miliband promises that "sooner or later . . . the working class and its allies will acquire the faculty (for ruling a nation . . .)" (pp. 276-277), one feels constrained to ask whether this is likely to happen in America under a red hammer and sickle, or a gray Confederate flag.

Economic determinism also appears to be an unrewarding perspective from which to view the psychological costs not only of capitalism's human failures but its material success. Pervasive consumerism, for example, has enabled capitalist society to neutralize values which threaten it by embracing and merchandizing them; like his liberal counterpart, however, the coercion-conscious Marxist is unlikely to perceive that a *Vogue* feature celebrating anarchism or a *Time* Essay pondering Black nationalism can do far more to emasculate "treasonous" ideas than censorship or repression. Nor is he apt to feel obliged to account for such symptoms of bourgeois malaise as alienation, anomie or ennui indicated in soaring rates for middle class crime, alcoholism, divorce and suicide—despite the fact that in many capitalist societies the middle class constitutes over half the population. The young Marx of the Paris manuscripts might have been able to respond to this class of issues, but Miliband reflects the concerns of the mature and cynical Marx of *Kapital*.

Here Professor Miliband will object that such problems as these are symptoms of decadence rooted in the capitalist mode of production and its attendant economic relationships, and are to be fully apprehended only in the context of economics and history. In a compelling passage enumerating some of these symptoms, he writes:

Opponents of capitalism believe it to be a system whose very nature nowadays makes impossible the optimum utilisation of resources for rational human ends; whose inherent character is one of compulsion, domination and parasitical appropriation; whose spirit and purpose fatally corrode all human relations; and whose maintenance is today the major obstacle to human progress. (p. 73)

But this raises the second more methodological set of difficulties facing Miliband: how to establish cause from historical evidence? How to demonstrate the validity of the Marxist interpretation as against some other? As Miliband concedes, "bourgeois politicians and governments view the system [described in Marxist terms above] in precisely opposite terms—as most closely congruent with human nature, as uniquely capable of combining efficiency, welfare and freedom . . . (etc.)." If marxism is to be something more than a self-evident and closed philosophical system within which everything becomes explicable and nothing predictable, it must in rejecting bourgeois explanations adhere to some notion of evidence and proof. Yet though cumulatively persuasive, Miliband's reasoning does not display a careful regard for rules of evidence. Terms like "often," "primarily," "mainly," or "generally" are allowed to serve purposes which belong properly to sociological or economic data. And where changes in social structure or simple material progress have beclouded traditional class models, Miliband seems to rely on the irrefutable proposition that the non-exploitative exception is but proof for the exploitative rule. If major concessions are made to unions they are to be understood as the 'ransom' or 'price' paid by capitalism to insure its preservation. Though civil liberties may be real and may even "help to mitigate the form and content of class domination," one can nevertheless be certain that "this mitigating function does not abolish class rule and even serves, at a price, to guarantee it." (p. 266) But surely at some point mitigation becomes transformation, attenuation becomes abolition; at some point capitalism's "concessions" annihilate capitalism and the exception becomes the rule.

This is not to say that such a point has been reached, only that there must be such a point. Otherwise, like the pseudo-Freudian who 'proves' all behaviour is sexual by treating apparently non-sexual behaviour in terms of sexual inhibition or repression, the pseudo-Marxist can explain away every kind and degree of equality, freedom and abundance by treating them as so many "concessions" made in the name of preserving hierarchy, servitude and poverty. Even the Dictatorship of the Proletariat can be understood as a concessionary tactic of a temporarily dispossessed bourgeoisie to insure its eventual return to power. Professor Miliband is certainly no pseudo-Marxist, but he does veer dangerously close to this logic when

he avers that "to achieve the dissolution (of class divisions) or even their serious erosion would take rather more than working-class access to refrigerators, television sets, cars or even 'tahitian' bungalows on the Riviera;" (p. 28). Class conscious or not, property-owning workers ensconced in tahitian hideaways on the Riviera have a great deal more to lose than chains.

Yet for all of its problems, the Marxist perspective comes far closer to capturing the relevant realities of the Western system of power than the sublimely complacent fixations of the pluralists. Its very vulnerability to rejoinder is one of its chief strengths, for its judgements inspire thoughtful controversy, its conjectures invite relevant criticism, and its profound humanity guarantees that politics will not be subordinated to methodology and that stability will never be mistaken for justice.

This reviewer's particular American prejudices make Professor Miliband's analysis suggestive rather than definitive; but the enterprise in which he is engaged can truly be called *political science*. This makes *The State in Capitalist Society* a rare book.—BENJAMIN R. BARBER, *Rutgers University*.

Revolution and Church: The Early History of Christian Democracy 1789–1901. By HANS MAIER. Translated by Emily M. Schossberger. (Notre Dame: University of Notre Dame Press, 1969. Pp. 326. \$10.00.)

The first edition of this book, written by the occupant of the chair for Political Science at the University of Munich, was published in Germany in 1959; it covered the origins and development of the Christian democratic idea in France during the period 1789 to 1850. The second edition, enlarged by a chapter that takes the story to the end of the 19th century and the encyclicals of Pope Leo XIII, has now been made available for the English reader. The translation is competent and the documentation ample, yet this is a curiously uneven book. Some chapters are well organized and readable while others are rather confusing. The book as a whole will be of interest more to the historian of ideas than to the student of the Christian Democratic parties that flourished in Western Europe in the years after World War II.

The reader may want to skip the first chapter in which Professor Maier toils valiantly at elucidating the meaning of terms such as "Conservative Catholicism," "Democratic-social Catholicism," "Liberal Catholicism," "Political Catholicism," "Social Catholicism," "Democratic Catholicism," "Catholic traditionalism," and "Catholic politics." Since this chapter lacks a chronological or topical structure the author's trains of thought much of the time are rather difficult to follow. The next

three chapters, on the other hand, are interesting. They deal with the encounter between French Catholicism and the French Revolution and the aftermath of this collision—the attempt on the part of some French Catholics to achieve a reconciliation of church and revolution. The latter task, Professor Maier argues, was indeed the overriding aim of Christian Democracy in France.

A substantial segment of the French clergy at first was sympathetic to the French Revolution. It has been estimated that about one half of the secular (parochial) and about one third of the entire clergy swore the oath of loyalty to the Civil Constitution of the Clergy of July 1790. A member of this so-called "Constitutional Church," Mgr. M. Lamourette, the Bishop of Lyons, was the first to use the term "Christian Democracy." Addressing a parliamentary committee, the progressive bishop contrasted the moral principles of the early church, founded by "the wise man of Nazareth, the true friend of the people," with the later corruption that made Jesus into an aristocrat and "opened the eternal abyss under the steps of whoever would think of breaking the chains of servitude." But the spokesmen of a "holy alliance of Christianity and Freedom," as Professor Maier shows in an informative chapter, soon lost ground and the amalgamation of church and democracy ended in failure.

In the next two lengthy chapters the author treats of the political thought of the traditionalists, de Maistre, de Bonald and the early Lamennais, as well as the reemergence of more liberal currents during the years 1830–50. While this discussion does not break any new ground it is, nevertheless, carefully executed and highlights a good many interesting details. The last chapter, on the other hand, dealing with the years 1891–1901, fails to live up to the same standards of thorough scholarship and readability. The Paris Commune and, more importantly, the laic laws of the Third Republic are barely mentioned with the result that the discussion of the *Ralliement*, the attempt on the part of Pope Leo XIII to reconcile French Catholicism and the republic, badly lacks historical context.

As Professor Maier himself notes at the end of his book, it was not French Christian Democracy but the political Catholicism of Belgium, Holland and Germany that pointed the way to the later Christian Democratic parties of Europe. This being the case, the subtitle of this book is just a bit misleading. The work represents less a contribution to the history of European Christian Democracy than the generally thoughtful treatment of an important chapter in the history of French Catholicism.—GUENTER LEWY, *University of Massachusetts, Amherst*.

The Critique of War: Contemporary Philosophical Explorations. EDITED BY ROBERT GINSBURG. (Chicago: Henry Regnery Company, 1969. Pp. 360. Clothbound, \$12.50; paperbound, \$3.95.)

Ginsburg has selected 18 of 192 essays submitted by philosophers of many countries. One comes away from it all with two vivid impressions. First, war is senseless, horrendous folly. Second, Philosophy can surely do better than this.

The first impression jumps out at the reader constantly—reminding him of Calvin Coolidge's fabled report of the morning sermon. "He talked about sin. He was agin' it." Indeed, there is so much *agin'ness* here that one longs for the constructive analysis promised in the editor's introductory essay: "Since war is human activity, philosophy must propose plans of action to counteract war. To denounce war does not suffice. Philosophy must lead to the practice that will defeat war." (p. xiii).
